INDEX TO VOLUME X.

JANUARY 1 TO JUNE 15, 1894.

PAGE	PAGE	PAGE	
A BSORPTION of Drugs in Ointments.....	569	ASSOCIATIONS, PHARMACEUTICAL (MEDICAL, ETC.):	
Acetamid and Nitrous Ether.....	31	American Medical.....	323
Acid, Benzoic, Odor.....	549	American Pharmaceutical.....	496, 517, 517
Carbolic, Liquid.....	301	Arkansas.....	496
as Poison.....	107	Boston Druggists.....	532
Carbonic, Liquefied.....	280	California.....	532
Cathartic.....	398	Colorado.....	496
Citric, New Process.....	183	Connecticut.....	180, 227
Diethylbenzoyldiamidodiphenylcar-		Dallas, Tex.....	227
bitrisulphamate.....	107	Delaware.....	526
Nitric.....	465	Georgia.....	532
Nitro-Sulphuric.....	146	Hartford Druggists.....	131
Oxalic, Plant's Protector.....	454	Houston, Tex.....	227
Salicic, New Process.....	306	Illinois.....	275, 532
Acetic Blacking.....	93	Illinois Drug Clerks.....	496
Ad., Your.....	438	Indiana.....	496, 527
Ads., Embree's.....	280	Kansas.....	226, 496, 577
Good.....	255	Kansas City Paint, Oil and Varnish.....	253
Advertisement, Food and Drug.....	6	Kentucky.....	369, 436, 532
Advances in Analytical Chemistry in Re-		Laporte Co., Ind.....	532
cent Years.....	288	Louisiana.....	496
Advertising, Deceptive.....	580	Louisville Botanical Club.....	497
Druggists.....	138	Maine.....	578
Effective, Simple.....	541	Maine (Eastern).....	369
Hints on.....	184, 290,	Manitoba.....	509
585		Massachusetts.....	496, 578
Miscellaneous.....	223	Michigan.....	580
Results of.....	93	Milwaukee Drug Clerks.....	131, 369, 532
Schemes.....	540	Minnesota.....	532
Schemes, Patients on.....	587	Mississippi.....	226, 496
Strategy, Thoughts.....	256	Missouri.....	28, 496, 532
Ascendic.....	159	Monroe Co., N. Y.....	131, 226, 496
Air, Liquid.....	142	Morfar and Vestie Club.....	369
Purifying by Charcoal.....	273	Louisville.....	578
Alarm, No Cause.....	353	New England Wholesale Drug Ex-	
Albumen, Blood.....	365	change.....	578
Tannet's Reagent.....	162	New Jersey.....	496, 577
Alchemist.....	211	New York.....	275, 496, 532
Alcohol, Deodorizing without Distillation.....	135	Norfolk and Portsmouth.....	131, 275
Deodorizing Recovered.....	135	Ohio.....	369, 436, 496, 577
Internal Revenue Tax on.....	40	Ontario.....	532
Rectification.....	324	Pensylvania.....	532
Tax.....	159	Rhode Island.....	578
Alkaloids and Sodium Phosphate.....	404	St. Louis Paint, Oil and Varnish.....	253
Alphol.....	423	Santa Clara Co., Cal.....	369
Alterative Remedy.....	569	Southern Wholesale Druggists.....	275
Aluminum Borofluorate.....	301	Tennessee.....	275, 532, 578
How Obtained from Ores.....	107	Wheeling Druggists.....	578
Powder.....	401	Wisconsin.....	578
Salicylate.....	350	Asthma Remedy.....	106
For Surgical Instruments.....	351	Atherin.....	60
Alumol.....	349	Atwell's Chemistry.....	269
Amateur Prescribing and Drug Peddling.....	349	Australian Pharmacy.....	337
Amidic-Atropin.....	305	Autrian Trade, 1893.....	487
Ammonium Carbonate, Anhydrous.....	345	B ACTERIA, Chemistry of.....	104
Anyl Acetate in Gold Sizing.....	391	Bacteriology, Something about.....	598
Anilized and Aniline.....	246	Bacteriology, Water.....	557
Analysis, Reports.....	210, 253, 468	Bactericides, Effective.....	267
Ant-Curl.....	384	Bagdad Pharmacy.....	76
Antifibrin.....	108	Baking Powder.....	144, 160
Antipyrin.....	108	Balsam, Castile.....	401
Antirheumatic.....	389, 456	Fir and Nitrous Ether.....	210
Antiseptic Powder.....	456	"Bar".....	569
Solution.....	284	Barbers, Donald M.....	106
Toxicity.....	284	Barometers, Odd.....	560
Antispasmodic.....	540	Basham's Mixture, Precipitate in.....	350
Antitoxin, Diphtheria.....	269	Bay Rum.....	15
Antitoxin, Tetanus.....	112	Beeswax, Adulteration.....	58
Ants, Around Soda Fountain.....	369	Beldonia, Alkaloids in.....	107
Anty-Keep Away.....	196	Belline, Coloring.....	353
A. P. A., Entertainment Expenses.....	228	Bismuth, Compound.....	276, 310, 353, 534
Join.....	369	Bicycle Tires, To Preserve.....	160
Membership Committee.....	196	B IOGRAPHIES:—	
Apprentices in England.....	228	Baldock, Jas. T.....	119
Aprozone.....	60	Bartley, E. H.....	17
Are You Prepared?.....	463, 509	Billhardt, Adolphus.....	319
Water.....	352	Biddle, George.....	442
Asaprol.....	107, 385	Cameron, Donald M.....	106
Ascaric Quinine.....	61	Crombie, S. M.....	139
Asobolin.....	61	Curry, F. R.....	402
Asparagus, Preserving.....	561	Davis, W. M.....	442
ASSOCIATIONS, PHARMACEUTICAL (MEDICAL, ETC.):		DeWitt, J. D.....	449
Alabama.....	436, 532	Gilman, G. D.....	325
American Chemical Society.....	79	Gilman, J. A.....	325
		Harrison, D. A.....	442
		B IOGRAPHIES:—	
		Hinchman, C. C.....	82
		Hinchman, J. M.....	82
		Hinchman, T. H.....	83
		Iron, D., Jr.....	412
		Intehinson, W. M.....	17
		Jenks, Chas. C.....	142
		Madison, W. H.....	471
		Markoe, George F. H.....	433

BOOK REVIEWS

Essays in Historical Chemistry 450
 Formaldehyde Medicaments Convention 547
 French Doctor's Book 147
 How To Do Business 547
 Massachusetts Board of Health Report 547
 Macro-Chemical Analysis, Manual 547
 National Dispensary 192
 W. T. A. Proceedings 28
 Pathology and Treatment of Cataract 244
 Physician's Wife 244
 Political Economy of Natural Law 244
 Qualitative Chemical Analysis 244
 Schuppel's Medical Cases 244
 Smithsonian Institute Report 240
 U. S. Dispensary 450
 Book on Commercial Sale of Drug Business 354
 Books on Grasses, Fungi and Insects 111, 160
 on Pharmacy 250
 Pottery 210
 Veterinary 210
 Borax, Cocaine and Glycerine 150
 for Epilepsy 107
 Salaries and Applications 70
 Boston Druggists' Association, Annual Dinner 117
 Botany for the Pharmacist 401
 Progress in 352
 Unprofessional 555
 Brass, Cleaning and Polishing 511
 Bromide Compound, Effervescent 386
 Bromine Derivatives and Phenol Chlorine 386
 Bromoform, Pharmacy of 12
 Bronze Paint, Liquid for 53
 Bronzing Leather 112
 Camell, American 61
 Burnings, Drugs 145
 Burns 39
 Children 38
 Cotton 38
 Butter Color 61
 Buying and Testing Drugs 438

CAFFEINE Chlorate 356
 Citrate 241
 Caffeine Sulphamate 108
 Caking of Powdered Extracts 258
 Calcium Carbide 388
 Calceola, Non-medicole 38
 Calceol, Japanese, Manufacture of 536
 and Sodium Bicarbonate in Prescription 510
 Camphoid 255
 Camphor Cream 111
 Cane in California 228
 Canadian Pharmacy Not What It Should Be 132
 Not So Bad 228
 Cancer Cure 44
 Cane, Nitrate 61
 Carol-Vaseline 107
 Carbon Bisulphide as Insecticide 107
 Carbonic Acid Motor 39
 Carminum 60
 Carpets, Dry Cleaning 230
 Carter, Carter & Kilham's New Home 115
 Cascar Sagrada, Aromatic Fluid Extract, 142
 Castor Oils to Agents 442
 Catarrh Balm 495
 Caustic Balsam 401
 Catechu, Homemade 251
 Catnip 564
 Chamois Leather, Cleaning 564
 Chamois Leather Compound 109
 Chemical Division, U. S. Department of Agriculture 153
 Industry of the United States 34, 105
 Chemistry, Ancient 508
 Applied, Education of Young Men in 435
 Bacteriology 346
 How Best Taught 346
 and Reading Notices 207
 Chemist's Cat 435
 Chemists, Industrial, Education of 160
 Cherry Phosphate 160
 Chevreulin Gum, Chile 160
 Chicle Chewing Gum 108
 Chilliain Ointment 19
 Pencils for 194
 Chilean Nitrate Industry 85
 Diethyl and Potassium Bromide 351
 Chloralose 351
 Chloroform 401
 Chlorine from Potassium Chlorate and Manganoxy Dioxide 236
 in Tablets 345
 Chlorolyne 345
 Chloroform 350
 Description 241
 Chloral 401
 Chloro-Naphtholeum 109
 Cholera Cures 408
 Powder, Chinese 212
 Remedy 408
 Cigars, Doctoring, German Method 486
 Cincholine 494
 Cleaning Bottles, Etc. 241
 Carpets 250
 Fluid 561
 Tissue 510
 Small Paper 494
 Clippings, Preservation of 460
 Coal Products from 322
 Tar Colors, Sanitary Relations 383

Cocain Plant 375
 Cocaine, Borax and Glycerine 150
 Coloidal, Coloring Principle of 404
 Code of Ethics, Pharmacists' 351
 Code Substitute 582
 Cognition and Cool Storage 490
 Cold Cream 408
 French 408
 Lanolin 212
 Collapsible Tubes 345

CHARLES RICE.

A conspicuous figure in American pharmacy is Dr. Chas. Rice, of New York. Born in Munich in 1841, of Austrian parents, he received a very thorough education in Vienna, Munich and Passau, acquiring a thorough mastery of several Oriental languages, of the classics and of modern tongues. He enjoyed the friendship and aid of many of Europe's distinguished scholars, the result of their teachings being that he is a most thorough and accomplished linguist. He turned toward a professional and technical career in his early manhood, and, acting upon the advice of friends and relatives, came to America in 1862. The Civil War then being in active progress, he entered the navy as surgeon's steward, or, as it would be called now, apothecary,

and served in this capacity until late in 1865, during which time he was able to visit the four quarters of the globe. After his discharge from service, he entered the Department of Public Charities and Corrections of New York City, with which he has ever since been connected, now holding the position of chemist to that department and superintendent of the General Drug Department. He became a member of the New York College of Pharmacy in 1867, has served as one of its trustees since 1870, and, as an officer in one or another capacity, he has been one of the most faithful friends of the institution. He was made chairman of the Pharmacopoeia Committee of the A. P. A. in 1877, and has served as chairman of the Com-

mittee on Revision of the U. S. P. since the sixth decennial revision. He is the possessor of the honorary degree of Doctor of Philosophy from the University of New York, is an honorary fellow of the New York Academy of Medicine, and has preserved a close connection with several Oriental societies, in which he has always taken great interest. He has done valuable work for the Indian government, and is recognized as an authority on questions of philology and etymology. He is a prolific writer, and has had great experience in editorial and revisory work. The U. S. P. shows the quality of his service, and is alone a monument to his attainments.

ENTERED AT THE DETROIT F. O. AS SECOND-CLASS MATTER.

ESTABLISHED 1887.

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

UNIFORM PRICES ON PHARMACEUTICALS.

In connection with the resolution adopted at the last meeting of the N. W. D. A., relating to this matter, the leading pharmaceutical manufacturing houses were asked for an expression of their opinion upon the advisability of the step proposed and placed in charge of the committee of which Mr. C. F. Weller is chairman, for action and report. A majority of these houses prefer not to speak for publication, but we give, in our correspondence department, the views of a few firms. The suggestions and opinions there presented bring out phases of the subject which are important for careful consideration by the committee.

INTERNAL TAX ON PROPRIETARY MEDICINES.

The ways and means committee have been considering the advisability of imposing a stamp tax upon proprietary medicines for revenue purposes. We are informed that a majority of this committee are in favor of such tax, and that a measure to this effect will probably be reported to the House for action. The members of the National Wholesale Druggists' Association and of the Association of Manufacturers and Dealers in Proprietary Medicines are up in arms against the proposition. The chairman of the committees on legislation of these bodies are distributing circulars among their members, requesting them to at once enter emphatic protest against the establishing of this tax. These circulars are reprinted in full elsewhere.

SPECIFIC DUTIES ON DRUGS.

The lot of the tariff adjuster is not a happy one just at present. The changes contemplated by the Wilson bill are bringing in an avalanche of commendations, protests and petitions. No class of business men but find something to object to, though in the main they may consider the proposed measure a good one. Perhaps as little dissatisfaction as exists in any branch is felt by the drug trade, who, however, want some changes made which they feel are reasonable and just. Importers of drugs are petitioning congress to make the duties on chemicals and drugs for medicinal use specific instead of ad valorem, believing that specific duties favor the importation of the better qualities, while ad valorem duties promote traffic in inferior grades. It is claimed that honesty is made difficult and a premium placed upon dishonesty when ad valorem rates are in force, for the honestly rated goods must compete with those undervalued as inferior, but which later appear under the price and name of the good. Undoubt-

edly there are some features of the bill which can be altered for the better, and the best we can wish for its framers is that they may be able to please and serve the majority, instead of the minority, of the many and diversified interests which are concerned.

HELPING THE CLERK.

How many druggists guide and oversee the studies of their clerks with a view to their best professional training and advancement? The set of questions (elsewhere in this number) devised by one employer to test the knowledge of his clerks, shows what great good may be accomplished by intelligent supervision of the student's labors, and constitutes a most worthy example to others. The clerk has a right to this character of aid from his employer, and in most instances where sought, it is most willingly accorded. Whatever the character and attainments of the employer, he is flattered by such an application, and stimulated to its best fulfillment. He appreciates this evidence of earnestness and seriousness in the clerk, and is inclined to place greater confidence in him. The employer stands naturally in the position of preceptor, and at least one board of pharmacy recognizes this relation in requiring from the employer an affidavit of the character of the experience gained by the applicant for examination. The influence of such an example as this influence cannot but be for good. Undoubtedly there are many others who take as great interest in their clerks' welfare, and an exchange of plans and methods through the columns of the pharmaceutical journals would be productive of a widening of this influence and an extension of its good effects.

"PALMETTO" TRADE MARK DECISION.

The recent controversy between the State of South Carolina and the United States patent office over the registration of a trade-mark, "Palmetto," which the state sought to use in connection with its lately assumed control of the liquor traffic, has at last been decided in favor of the state, and the Supreme Court of the District of Columbia, in a lengthy opinion, has given an authoritative statement of the real scope of the trade-mark law, which appears in full in the official gazette of the patent office for November 21, 1893. The application was at first denied by the examiner of trade-marks, on the ground that the State of South Carolina was not a corporation as contemplated in the act of March 3, 1881. The case was then appealed to the Commissioner of Patents, who also refused legislation, basing his denial upon that clause of the law which says: "No alleged trade-mark shall be registered unless it appears to be lawfully used as such by the applicant in foreign commerce," and upon the dispensary act itself, which does not authorize trade in liquors outside the limits of the state. The court held that it is the duty of the Commissioner of Patents simply to decide whether an applicant has a right to use a trade-mark as such, and should determine, not the right to use in trade with foreign countries, but simply the fact that it has been used in such trade. The decision of the court states that the registration of a trade-mark confers upon the registrant no new right of property in the trade-mark itself, but simply cer-

titles to a presumption of ownership of the trade-mark in connection with trade in a certain class of goods, and in case of suit for infringement operates to change the usual procedure by placing the burden of proof upon the defendant, and it is only in such cases that all the rights of ownership can come up for judicial decision.

AFFIDAVITS OF EXPERIENCE.

The recently adopted ruling of the Michigan Board of Pharmacy that hereafter all applicants for examination as registered pharmacists must have had at least three years' actual experience compounding drugs in a retail drug store under the supervision of a registered pharmacist, and all applicants for examination as registered assistant pharmacists must have had at least two years of such actual experience, is a matter of greater significance importance than it might seem at first thought. Affidavits from employer or teacher certifying to the length of this actual experience are to be required from applicants for examination. Doubtless there will develop some opposition to these regulations, but a little consideration will show that they are calculated to correct certain abuses which have become prominent in the past few years. The dishonest applicant has lied about the extent of his pharmaceutical service, and by cramming from quiz compends, "aids" and the like, has succeeded in passing, barely, the portals of a profession to which he can never be a credit. But the affidavit can be proven, the employer is not going to carelessly sign such a document nor swear to a falsehood, and the document becomes in some degree a guaranty of the quality of the experience, the further and full extent of which quality the board proposes to ascertain through its examination. Michigan, at least, does not intend to be the dumping ground for incompetents, and the Board of Pharmacy, knowing what constitutes a good pharmacist, is trying to insure that all whom it registers are truly qualified.

MINISTERS ON MEDICINE.

The religious press has always borne the reproach (a just one, too) of fostering quackery, often of the most arrant and indecent nature, and the opening of its columns to lying advertisements and fulsome recommendations from clergymen of quack nostrums have disgusted people who know the true nature of the frauds. Every fake patent medicine has relied largely upon the support won, very easily, from clerical gentlemen, for there is a very large proportion of humanity which believes what the minister says. It is therefore very surprising, though most encouraging, to find one religious paper which is beginning to lose faith in quackery. Here is what it says:

"No person should trifle with health, nor use uncertain remedies in sickness when certain ones are within reach. We have more faith in genuine medical science than we once had, and less faith in empiricism and quackery. The best counselor is a reliable family physician of progressive studies and Christian principles. Avoid the traveling quacks and most of the loudly heralded cure-alls which in the end do more harm than good. There are many proprietary remedies of established value, which physicians themselves prescribe, but it is

safer, as a rule, to take any kind of medicine only on advice of a physician. He who gulps down patent medicines at his own instance undertakes to judge his own symptoms and prescribe their remedy when he knows nothing about either. Ofttimes a bit of surgery will do more good than a thousand nostrums. No doubt there are villains in the medical profession who abuse their trust, and impose upon their patients, but as a rule, with good judgment in choosing a physician and in following his directions, we are far safer in the hands of those who make diseases and their treatment the study of their lives than we are in the hands of ignorant and unprincipled charlatans, who are interested only in getting our money."

A little faint hearted yet, but it will become more courageous as it finds it has lost no real friends, but has rather gained in authority and reputation for sincerity and truth.

THE CUTTER.

The list of advertised cutters on another page shows how wide-spread has become the practical practice of cutting on patent medicines. It has indubitably worked much injury to the drug trade, and it is difficult to see where anyone has been benefited. If even the cutter made anything out of it, he might argue its advantages. But he doesn't profit from it, at least directly, and any indirect benefit cannot be positively asserted. In all cases cutting is adopted, not to realize a profit on the goods cut, but on other lines, with the prices of which the purchasing public is not familiar. The cutter uses leading patents as baits to advertise his wares, and he would not be satisfied if his sales were on the cut goods alone. Nor could he live on such a business. He depends on an exorbitant profit on other sales, or he may be satisfied with a small percentage if the aggregate be sufficient. Thus he does not hesitate to steal a portion of the legitimate business of the druggist can carry it on illegitimately, that his other lines may be advanced. He tries to argue the justice of his proceedings, but his arguments are superficial and specious. He adopts cut prices in the belief that increased trade will result, reasoning that it is better to sell ten articles at five cents profit each than one article at fifty cents advance. If he applied this rule thoroughly and consistently, there could be no logical objection; it would be business; but he doesn't do this. He sells a few leaders at cost or less, a few lines on very small margin, and raises the remainder of his wares, trusting to luck to see him through, or else keeps prices low and lowers quality commensurately to afford the required profit.

Then another aspect of the case must not be overlooked. How is the cutter's business and financial standing affected? As a rule the cutting druggist is regarded with suspicion, for there is abundant warrant for the belief that cutting is his last resort. His credit becomes impaired, his bills must be paid promptly or he can purchase only for cash, and his stock depreciates greatly in value in the estimation of those who know. The reputation for cheap patent medicines which he seeks soon enlarges into a reputation for cheap goods all the way through, and to sell them at such low prices he must and does depreciate their quality.

"THE WOLF IN SHEEP'S CLOTHING."

The accusations which Mr. F. K. Stearns, president of F. Stearns & Co., makes against the house of Parke, Davis & Co., are of too serious a character to be ignored, and the more so when Mr. Stearns, as he has done, makes the charges over his own signature, thereby showing that he desires no relief from the full responsibility of his statements.

Of one thing we are sure. Parke, Davis & Co. cannot satisfy any intelligent physician or druggist by avoiding the issue with the statement, "that attacks from odious and petty rivals must always be the lot of any house which stands foremost in reputation and magnitude." Much less will they command the respect of even their friends by unearthing that old matter of Mr. Stearns, Senior, with the American Pharmaceutical Association. They certainly must know that Mr. Stearns, Senior, retired several years since from the active management of the company which bears his name, and that he has nothing to do with this controversy. That unfortunate affair of his is a thing of the long past as it occurred a quarter of a century ago. Mr. Stearns has repeatedly acknowledged his mistake in private and in public; he paid dearly for his error by the loss of professional standing and friends, and the A. P. A. lost one of its most able workers. Some of the very men who voted against him have since tried to gain his consent to a movement for his reinstatement, and all parties admit that, if calmer counsel could have prevailed at the time of his expulsion, the desired results would have been accomplished without resorting to such severe measures. It was the mistake of a brilliant man's career. He has acknowledged his error and paid the penalty, and no one but a dastardly coward would bring it up against him at this late day, in his declining years.

No set of politicians ever framed a platform of their alleged party principles with more deliberation than did Parke, Davis & Co. construct their so-called "Scientific and Business Platform." We reprint this platform here, that the reader may see for himself what strong claims they make for virtue and integrity in the conduct of their business:

SCIENTIFIC AND BUSINESS PLATFORM.

We respectfully invite the attention of physicians and pharmacists to a brief statement of the ethical, scientific and business principles upon which we strive to base our operations as manufacturing chemists. We shall be pleased to communicate with any member of either pro-

cession who may desire further literature in amplification of any or all of these principles, and cordially invite such correspondence.

We hold that the manufacturing pharmacist who desires the patronage and values the respect of the physician, should study and conform to those principles of medical ethics which affect the production and marketing of medicinal preparations, therefore:

- A. We strive to maintain the highest standard of quality.
- B. We do not manufacture or market any preparation protected by copyright, patent or trade-mark, or by concealed or misrepresented formula.
- C. We do not so label or advertise our products as to encourage or admit of their use by the public without the advice of the physician.
- D. To the end that the product and the art of its manufacture may never become lost to science, every medicinal preparation should have a proper name, open to general scientific usage; and its formula should be published in scientific literature in such a manner that any competent pharmacist may readily prepare it.
- E. We hold, further, that the manufacturing chemist should lend his superior resources to the advancement of both medical and pharmaceutical science; that he ought not to act altogether from a selfishly pecuniary motive, but should be guided in view the general well-being of humanity, and, as tending to this end, the continued progress of medicine and pharmacy.

Based on our claim to the consideration of the physician and pharmacist upon the foregoing statements, an investigation of the truth of which we earnestly solicit, we remain,

Yours very truly,
PARKE, DAVIS & COMPANY."

This "platform" is certainly an ideal standard, but to an unbeliever it affords much amusement. While one cannot but admire the brain which conceived it, you wonder how he dared to be so bold. They have braced their platform by the liberal use of "circular supports," and some of these circulars are truly rich. Let us give a few of the more rare specimens:

This is worthy of a statesman—

"Nations, political parties and all organizations, as well as individuals, have their policies or policy, good or bad, by which their acts are governed, and commercial houses are no exception to the rule."

They pledge themselves for all future time—

"We have written and published over our signature in the various medical journals of the United States, a platform setting forth our relations individually to the medical profession, and pledging ourselves to maintain for all future time the position which we have assumed."

They prefer to be honorable.

"We prefer, however, to conduct our business on what we believe to be an honorable basis, with due reference to our relations to the Medical Profession and to our connection with the Profession of Pharmacy."

They boldly assert no trade-marks.

"As a part of the policy, we have ourselves never taken out any copyright, trade-mark or patent, or made use of any secret formula with relation to any medicinal preparation or combination issued by us."

They never protect or monopolize.

"With this policy to guide us, we have never protected or monopolized the manufacture of any medicine or pharmaceutical compound. We publish the formulae of all preparations we make, and every article on our list is open to the freest competition."

How about their own journals?

"Proprietary or trade-mark pharmaceuticals are advertised extensively in medical journals. Editors of journals containing such advertisements defend this quackery, fearing to lose their advertising patronage if they defend the profession against it."

The wolf in sheep's clothing.

The proprietary pharmaceutical specialty is a "Patent" medicine in disguise, and physicians who are humbugged by using such advertisements drummers who visit physicians' offices all over the land for that purpose, prescribe themselves out of practice and abuse their clientage to the charlatan and quack. This class of proprietary medicines may be regarded as the wolf in sheep's clothing; and the medical profession should be warned that they are admitting a very dangerous animal into the fold by prescribing them.

The wolf in his own clothing.

"Preparations of this kind may be illustrated by such compounds as Ayer's Cherry Pectoral, Hembold's Buchu, Warner's Safe Cure, etc. This class of proprietary medicines may be classed as the wolf in his own clothing, which the physician needs no caution to avoid."

Beware of the dulcet song of the drummer.

"Trade-mark pharmaceuticals are wolves in sheep's clothing. They are presented to us as legitimate pharmaceutical preparations, and we are requested to praise them. We owe to the doctor who listens to the dulcet song of the drummer." Their principles are based on truth and right.

"When we began our crusade against the patent and proprietary medicine interests, and for scientific medicine and pharmacy, every effort was made to misrepresent our motives and ridicule our policy. The principles for which we contended were, however, based on truth and right, and that they have prevailed is evidenced by their wide recognition to-day by the best element of the medical profession."

Their substitution platform.

"There exists for every proprietary medicine which has been proved to be of value, a non-proprietary counterpart, or scientific substitute, essentially the same in convenience of administration, palatability and medicinal efficacy. Can any rational physician hesitate for a moment in deciding which it is his interest to prescribe, the proprietary, or the non-proprietary preparation?"

They modestly offer to supply the goods.

"The formulae of any of these preparations will be furnished by us on application. Our pharmacies can fill and dispense these recipes, or we will supply the finished preparations in convenient form for dispensing."

But they are not in the business for revenue.

"It has been stated that we have personal reasons for waging this war. We answer frankly that we have. Our reason is not, however, as has been attributed to us, viz a financial one, but it is that which actuates every high-minded physician in adhering to his duties conscientiously under the code of ethics, to which he has subscribed and which is in strict accordance with self-respect and a scientific object."

The substitute is 25 per cent cheaper.

"What is claimed for Hematic Hypophosphites. It is claimed that this preparation is a faithful reproduction of Fellow Hypophosphites in all essential particulars, accompanied with a published formula based on a careful analysis of Fellow Hypophosphites. That it is, however, non-proprietary, and is a scientific substitute for the nostrum mentioned. That Hematic Hypophosphites is sold at about 25 per cent less than Fellow's Hypophosphites."

Mc and Squibb (from Instruction to Agents).

"The agent is to approach the doctor, wearing his most persuasive smile, and say: 'Doctor, I take it for granted you know all about Parke, Davis & Co., by whose request I call on you. They are the largest manufacturers of medicines in the world, and I have a favor to ask. Squibb are the only ones who protect the interests of physicians by having nothing whatever to do with proprietary or patent medicines, which now take away so much practice from the physicians by their direct sale to the public.'"

Some disinterested advice to physicians.

"The laws of ethics and self-interest alike urge the physician to give his patronage to that manufacturer who confines his work to unproprietary pharmaceuticals, and we believe that no physician who thoroughly examines the question of protected pharmaceuticals can fail to declare himself as opposed to them."

How a physician can pay his obligations.

"I, as a physician, owe a duty to science, to my profession, and to the cause of suffering humanity. Taking the above facts into consideration, I feel sure that I can pay these obligations in no better way than by specifying 'P., D. & Co.' in my prescriptions."

How about Damiana Wafers?

"Now, we ask the medical profession which manufacturer is the more worthy of patronage. He who places before them leading medicines only, or he who manufactures nostrums? We ask the doctor which one it is his individual interest to patronize. And when he has determined this question for himself, we ask him simply to live up to his conviction on this point by specifying the medicine that manufacturer who is working for him, rather than that one who is working against him."

MR. STEARNS' ACCUSATIONS.

Now let us compare their code of ethics with some of the charges made by Mr. Stearns, who is a responsible party and presumably knows what he is talking about, or he would not dare to make such statements. They certainly cannot object to this, for they earnestly solicit an investigation of the truth of the statements made in their "platform."

Mr. Stearns says this house is one of the largest, if not the largest, manufacturers of patent medicines in this or any other country. Under the scientific classification of "Private Formula Department" they devote a large part of their laboratory space and help to making such goods as The Mormon Elder Damiana Wafers, Mother Siegel's Curative Syrup, Dr. Campbell's Arsenic Wafers, any number of the patent pills, orders for which are frequently taken for 1,000,000 or more; Shaker Extracts in 10-kg lots, and a well known Sarsaparilla in carload lots, etc., etc., etc.

Mr. Stearns also asserts that they have copyrighted or trade-marked some of their preparations, and he names Chlor-Anodyne; but says there are others of much more recent date and he challenges them to deny it.

He states that their claim that they do not put up "Non-Secrets" is absolutely false, and that he has plenty of their samples to prove his assertions.

He shows how, under the guise of another name, they reach the public with food products; how they sell their Maltale packed in barrels to grocers, and their Escencia de Calsaya and Escencia de Coca are to be found at the bars of hotels and clubs.

It is not a pleasant journalistic duty to pull down idols, even when in the shape of platforms. No pharmaceutical house in America was ever more liberally supported by the better element of physicians and pharmacists than this one. This support has been extended on the basis of their alleged principles as laid down in their platform, and, if they are not true to their professions,

IT CERTAINLY IS TIME THAT THE TRUTH BE KNOWN.

They have made it their special mission to herald their own virtues, and expose the weaknesses of their competitors. They have claimed to be free from all proprietary and patent medicine pollutions, while they have taken delight in pointing out such iniquitous customs in others. Hardly a prominent manufacturer has escaped their venom. Even Dr. Squibb was brought in for his share, doubtless because they were jealous of his well-earned reputation.

Why have this house departed from their principles as laid down in their platform?

To answer this question fully would call for an analysis of their history, their methods and management, for which we have not the time or space at this writing. Their so-called scientific policy was not the creation of the house itself. In truth, they thought it, or more strictly speaking, it was furnished to them by an employe, a physician who was fresh from the influence and teachings of his Alma Mater, and who undoubtedly believed in what he wrote. With the house it was a matter of "business policy"—this being a most frequent expression of theirs.

We cannot recall even one officer or general manager in the corporation of Parke, Davis & Co., during its life, who could lay claim to the advantages and teachings of a scientific or professional education, and we don't speak of this to belittle their business abilities, for they have shown these. But when a business house adopts the physicians' Code of Ethics as a "platform" for its business operations, it must have a general manager who holds very strong convictions regarding the truth of the principles involved, and not alone because it is good business policy, or sooner or later his business interests and instincts will get the better of his adopted professions. This business manager hired such professional men as Stewart, Lyons, Rusby, Mulheron and others, to construct his platform, and, so long as he followed their advice, the platform was kept in good repair. But they were only employes, gradually they disappeared, and their places were filled with men not so familiar with the structure, and who could not be expected to appreciate its full value. Other departments of the business were found more directly profitable than the "scientific department;" the manager was ambitious for a big business, the stockholders were fond of large dividends, and the inevitable result soon came.

The old platform, which had given this house a reputation which any manufacturing pharmacist might well be proud of, was neglected; it was not enlarged to accommodate the increasing demands of the business; its periodical coats of white wash were forgotten; the decaying planks were not renewed, and some of its best supports were gone. How soon will the frame work fall?

POISON BOTTLES.

The question of using a certain kind of container for all poisonous or dangerous drugs is one which is now receiving a great deal of attention in England as a consequence of Mrs. Tyndall's sad mistake, which resulted in the death of her husband. The agitation is already so strong that it is thought that the matter will early receive the attention of legislators, and laws be passed which will require some additional safeguard in the employment of dangerous remedies besides the usual poison or caution label. Pharmacists have long recognized the desirability of a distinctive container for such medicines, and many plans have been put forth to overcome this apparent defect in pharmaceutical practice. The fact that there are already many plans and schemes in existence renders a choice difficult, and also renders their employment without legal authority unsafe, as it is strictly essential in matters of this kind that there be a uniformity of practice, so that the same container will always convey the same idea as to caution in all parts of the country.

This same question of the means for the preservation of human life comes to the attention of all who are engaged in vocations of a hazardous nature. The records of the patent office are burdened with specifications for patent car cauplers and fire escapes. Yet the newspapers daily record casualties which the adoption of some uniform system might prevent. Inventive genius usually responds to demands which are made upon it, and the time seems propitious for a determined agitation which will lead to legal enactments requiring the adoption of uniform methods along certain lines for the preservation of life and health. One of the arguments advanced in connection with medical and pharmaceutical practice is that the labeling or placing of medicines in containers which convey an idea of their dangerous nature to the patient, has a very disturbing effect, and on this account such a practice should not be adopted; but when the record of fatal errors due to said omission is consulted, the force of such an argument is quite doubtful. The best preliminary measure which will lead to improvement in this matter, is the inauguration of a movement to educate the public to the idea that all medicines are dangerous, and that extreme caution should attend the administration of the simplest medication.

SAFEGUARDS AGAINST PRESCRIPTION ERRORS.

In connection with the matter of a uniform style of container for potent and dangerous medicines, referred to in another column, it is pertinent to glance at the precautions observed to insure the proper medicine. These precautions must be taken by the physician and the pharmacist. There is little new on this subject to be said, but so long as man is fallible, so long must admonition be reiterated. The doctor has but his sense of responsibility to impress upon him the necessity of care and thoroughness in writing his prescription. The pharmacist has his poison closet, electric devices, sharp-cornered bottle stoppers, caution labels, etc., to draw his attention to the fact that dispensing a prescription is responsible business, where a mistake made

is liable to be followed by serious results. But any of these mechanical jogs to attention may, and often do, fail. There should be more than this. There should be a mind not easily diverted to error, a conscientiousness that will insure accuracy and safety. But these attributes are not to be found in every man and, as none may reach perfection, it is necessary to adopt any and all precautions which promise the greatest degree of safety.

We all remember the Harris murder case in New York, where the defense endeavored to involve one of that city's honored and prominent druggists. This druggist, happily, was not only able to preserve but to add to his reputation for professional attainments and accuracy by demonstrating that in his store a mistake was out of the question; that his work could be relied upon. Knowing that man may err, but knowing, too, that two men are not apt to err in the same particular, he had perfected a system of prescription checking, the work of one man being checked by another. This method, it seems, would promise greatest immunity from error, and in some form or another it is in force in many drug stores. A modification recently described by one of our exchanges consists in the use of a label upon the bottle of compounded medicine, on the back of which label is the information that it was dispensed by..... and checked by....., date..... This label may be read through the back of the bottle, or it may be soaked off and examined. We do not see any particular valuable feature in this new application of the principle, except that it supplies a record. This record, however, can be kept in a more satisfactory and easily accessible shape than to place it on the back of a label which passes out of the pharmacist's hands. If it is a duplicate of the record on the pharmacist's prescription file, it is unobjectionable. But the rule to have the dispenser's work checked by another should be insisted upon in every store. Most pharmacists appreciate the gravity and responsibility of their calling, but there are some careless ones against whose possible errors no precaution should be omitted.

THE DETROIT PLAN.

According to the reports of a Boston jobber, whose communication we publish in our Trade Department, fully 70 per cent of the druggists whom this firm approached made no reply when asked if they favored the Detroit Plan.

The time has certainly come when the retail trade should express themselves on the subject. That so large a per cent of the druggists made no response whatever shows that a large number of them are entirely indifferent to any movement that affects their interests, but it is hardly right to condemn the whole trade because of the lethargy of a large number of its more insignificant members.

It is more significant that of those who did reply only 40 per cent. were in favor of the plan.

According to press reports, President Faxon, of the N. W. D. A., and ex-President Davis have recently been east on a tour of inspection, or missionary trip, trying to persuade manufacturers to come into the fold. We treat the matter at length in our Trade Department.

ARE YOU PREPARED?

Following is a set of questions compiled by L. Sollmon, Canton, O., to test the knowledge of some of his clerks who propose to undergo the examination of the State Board of Pharmacy.

A few comments upon this most commendable example are presented editorially.—Ed.)

1. How many official preparations contain phosphorus? Name them.
2. How do you test pepsin?
3. What is lead plaster chemically? Give the outline of its manufacture.
4. What is tincture belladonna made of? Give dose.
5. Name the material differences in strength between articles of the U. S. P. '89 and '90.
6. Name the specific gravities of six official articles.
7. Give an outline of the method used to ascertain the percentage of: (A) morphine, (B) quinine. In the crude drugs.
8. How would you make Acid Hydrocyanic Dilute? Give its strength and its dose.
9. What is the percentage of absolute acid used in most of the dilute acids of the U. S. P. '90? Name the exceptions.
10. (a) What fatty acids are official? and (b) in what official preparations do they enter?
11. How are oleoresins made? Mention some.
12. What vegetable acids are official?
13. What official preparations are obtained from (a) Pisces, (b) Insecta, (c) Mammalia?
14. How many kinds of alcohol are official? and how do they differ?
15. Name the official ammonium salts.
16. Name the official strontium salts and give their doses.
17. If you have 10 grams of pepsin (1:2000), how much saccharum lactis do you add to make saccharated pepsin U. S. P. '90?
18. What official preparations contain C. N. and what are their doses?
19. Of what official substances is the maximum dose (a.) 0.006 gm. (b.) 0.016 gm?
20. In what forms is Argenti Nitras official?
21. Give the solubilities of Acidum Carbolicum.
22. Give the percentage and dose of the poisonous liquors of the U. S. P. '90.
23. What cryptogamous plants or their products are official?
24. Give the percentage of Hg. in Massa Hydrargyri, Unguentum Hydrargyri, Hydrargyri cum Creta.
25. What hems are official?
26. How many glycerites are official, and what glycerine percentage do they contain?
27. What preparations of Juniperus are official?
28. What official preparations do we obtain directly and indirectly from the Coniferae?
29. Name as many opium preparations and their morphine percentage as you know.
30. What is Lactucarium and in what official preparations does it enter?
31. How and where are Elastica obtained?
32. What substances are tested gasometrically?
33. Give melting point of Petrolatum Molle, Petrolatum Spissum.
34. Spiritus Glonoini, give percentage, dose and action.

35. How do you make Sulphur Lotum, Sulphur Precipitatum?

36. Give the official names and doses of the following: Magendie's Solution, Godfrey's Cordial, Yellow Wash, Viallet's Mass, Volatile Liniment, Liver of Sulphur, James' Powder, Bay Itum, Phenyl Salicylate, Turlington's Balsam, Brown Mixture, Black Draught, Labarraque's Solution, Glauber Salt, Lugol's Solution, Solum Thiosulphate, Lac Sulphur, Artificial Oil of Wintergreen.

37. What are the two main divisions of the vegetable kingdom?

38. Describe by words or drawings the meaning of the following botanical terms: Petiole, pinnate, bract, alternate, truncate, cordate, sagittate, lanceolate, ovate, striate, nectem, corymb, umbel, calyx, corolla, sepals, receptacle, style, tuber, rhizome, corn, bulb, radicle, stipes, medullary rays, endoderm, testa, funiculus, mericarp, cotyledon, embryo, pericarp, placenta, hilum, putamen, florets, pappus, diocleous.

39. From what plants are the balsams obtained?

40. Mention as many as possible officinal plants belonging to the following families: Leguminosae, Ranunculaceae, Liliaceae, Rosaceae, Gramineae, Umbelliferae, Compositae, Rutaceae, Solanaceae, Rubiaceae, Euphorbiaceae, Orchideae, Scrophulariaceae, Cucurbitaceae, Labiatae.

41. What drupes are officinal?

42. How and for what test do you use starch?

43. How do you test for lead, copper, iron and zinc?

44. How do you test for sulphuric acid?

45. How do you test for hydrochloric acid?

46. How do you test for oxidisable matter?

47. How do you test for calcium?

48. What atomic weights do you know by heart?

49. Describe Bettendorf's test.

50. What is the meaning of indicator in volumetric testing? Give examples.

51. What is meant by boiling point.

52. If a bottle weighing tare, 9.3 gm. contains 3.5 c.c. of liquid and weighs in all 1.42 decagrammes, what is the specific gravity of the liquid?

53. How much N-100 KOH (55.99) solution does it take to neutralize 100 c.c. dilute hydrochloric acid (36.37) U. S. P. '90?

54. If you add chlorine water to a solution of potassium iodide, and then excess of solution of sodium hyposulphite, what physical and chemical changes take place?

55. Give the chemical symbols of 20 official substances.

BAGDAD PHARMACY.

A correspondent of the Pacific Medical Journal says: "The practice of medicine is in a degraded state, and patients are constantly bargaining with the physician for a cure, and refuse to pay for advice or for an examination. When a wealthy person is taken ill all the doctors and magicians in the city are sent for and their advice is followed or not, as it suits the fancy of the women neighbors. If a prescription is sent to the drug store it will probably be put up in an old, unwashed cod-liver-oil bottle and then an old rag and some paper is made to do service as cork.

CERTAIN DISTINCT ADVANCES IN THE ANALYTICAL CHEMISTRY OF RECENT YEARS.

By Albert R. Procott.

Of the important gains made by the present generation of chemists let us acknowledge.

(1) The resolute attempt to find out the composition of matter as a whole in any and all of its mixtures of whatever source.

Analytical workers have undertaken to resolve the complex mass and account for all its contents. It has been their ambition to identify and determine existing molecules of every sort within a given mixture, while synthetical workers have sought to reach the constitution of the molecules themselves. The task of complete analysis has been entered upon, that called "proximate" as well as that called "ultimate." There have been good investigations that have taken "extractive matter" and "emphyreumatic matter," and "bituminous matter," and other undetermined residues as subjects for the beginning of chemical work rather than the end of it. The task of the complete analysis of matter in its every possible portion is a task that has been recognized and entered upon as a necessity of chemical advancement.

I do not by any means infer that the determination of distinct compounds is the result of analytical chemistry alone, as but one of the divisions of the science. On the contrary, I would emphasize the dependence of the analyst upon the entire body of chemical learning. He is limited by this dependence even for the identification and estimation of distinct bodies without going into the make-up of molecules. Analysis is or ought to be a certain function of the whole body of chemistry, not a part of the body which could live if separated. An analyst cannot well be less than a whole chemist, and though his ends be single in direction, they are not indifferent to the powers common to all chemical insight.

The analytic method began to yield large returns in the last century. When Black made more exact qualitative examination of fixed air he began to uncover the chain of underlying truth laid hold of by Priestley, and fairly dislodged by Lavoisier and other contemporaries. In the first half of this century the enormous analytical detail instituted by Berzelius extended the very foundations of physical science. And in the present generation the analyses of biological chemists and industrial chemists of many and various purposes have been very influential factors in the support of great principles of chemical truth.

Again, the courage of analytical effort in recent years has been seen especially.

(2) In the elaboration of methods for the isolation of carbon compounds, both natural and artificial. "Proximate organic analysis" is not so greatly at a discount as it was twenty years ago. Research has been devoted to the estimation of organic compounds, unbroken and unaltered. It has been a common necessity to effect determinations truly "proximate," in the definition of this inadequate word. There have been pointed inquiries from the biologist often, from the metallurgist at times, from the theoretical chemist not seldom, what is the chemical

*Read before the World's Congress of Chemists, August 22, 1893, and published in the Journal of the American Chemical Society.

character of this body as it exists just before its analysis? Since Dragendorff devised ways of plant analysis, and Hoppe-Seyler collected methods of physiological analysis, thousands of contributions have enriched the resources of the organic analyst, and thousands of workers are now in like endeavor. Chemical literature is thickly strewn with directions for analysis to the end of identification of the integral molecule, representing matter in its living state, if such a figure of speech may be used. This is, indeed, the special task of analytical research, although the terms of analysis are also given to operations that accompany synthetic work, to wit:

(3) In studies of the molecular structure of bodies produced by nature, bodies mineral, vegetable and animal, as well as those of artificial production. To classify analytical work strictly by definition, which, however, I have no desire to do, all the studies of molecular constitution come within the range of analytical inquiry. But even under customary classification of chemical labor, it will be observed that certain instruments of observation early used by analytical chemists have since been found most effective in studies of molecular structure, even for what is termed the configuration of the molecule. Especially, therefore,

(4) In the employment of physical methods of inspection, whereby molecular change is avoided, important advances have been made in the analyses of recent years.

First of all through the several responses of the molecule to light, under more exact observation, the clearest of identifications have been obtained. Optical methods have multiplied and become more exact. We are, however, only in the beginning of their adaptation to analysis. Studies of geometric isomerism have shown the analyst how rich in results the polarimeter may become. Next to this, probably, stands the refractometer in its value as a means of recognition in analysis. Then the use of the spectro-scope for studies of absorption by transparent bodies has already done admirable service to analysis, both organic and inorganic. New responses of matter to heat have been brought under observation. In qualitative determinations, as in the finding of the molecular mass, the freezing point and the effect on solidifying points of solvents are in question as well as the melting points and boiling points. The chemical world is alive with interest in the advances of the new physical chemistry. To these advances no one is and is to be more indebted than the analyst. Solubility itself, the great common factor of analytical operation, is under investigation, in which the analyst has the keenest interest. The feebleness of adhesion, too often overlooked, causing waste in quantitative separations, and putting limits upon the best of our results for analytical recovery, these, with the phenomena of capillarity, are well under investigation. The very checks of control analysis serve as data for studies in molecular physics.

It is not possible for me to group together in classes near all the ways of advance in recent analytical chemistry, and I will but specify once more how this advance appears.

(5) In the reciprocal benefits of scientific research and of technical skill. We see this in the work of experts, those in

EDUCATION OF INDUSTRIAL CHEMISTS. By Henry Pemberton, Jr.

Some years ago a chemical firm in one of our eastern cities was desirous of obtaining the services of a chemist, who should take charge of the factory. Accordingly, advertisements were inserted in the industrial journals for a man who should not only be familiar with the analytical work, but who could also assume the responsibility of overseeing the plant, checking the running of the various processes, and meeting the emergencies that are constantly arising in operations of this kind.

A large number of answers were received. Interviews were requested with those who, from their letters, appeared to be the most likely to suit. But as a result, it soon appeared that the securing of a competent man was by no means an easy matter. Some of the applicants, whose letters were most assuring, turned out to have been simply laboratory boys. Others, more prominent, were of foreign birth but unfamiliar with the language and customs of the country. Some were undesirable on account of their personal manner or character. But, by far the most general objection was that the knowledge and experience of these chemists were limited to the field of analytical chemistry, and to the work of the laboratory. They were entirely familiar with the handling of the beaker glasses and funnels, platinum crucibles, analytical balances, burettes and flasks. But in the matter of treating material in large quantities, and obtaining results in the factory, they came up, as it were, against a stone wall. Many of them, in fact, were literally as unfamiliar with the operations of a chemical plant as they were with the working of an astronomical observatory.

It should be observed that the case here described is by no means an isolated one. There is reason to believe that there is hardly a large chemical manufacturer in the country who, at one time or other in his life, has not had experiences of a nature similar to this one.

It will be admitted that the question of a technical education is a most important one. It deserves at least as much attention in the United States as it does elsewhere, on account of the remarkable progress and development of industrial activity here. It will be shown in the forthcoming report of the United States Census of Manufactures, that the chemical industry has experienced a more diversified and extended growth than is peculiar to any other branch of productive industry in this country. Owing to the richness of our resources (which we have always enjoyed), and owing especially to the beneficent effects of a high tariff (which we have enjoyed for three decades) the capital invested, the wages paid, and the value of the chemicals and allied products manufactured, represent in the aggregate a degree of prosperity that is most flattering.

It is for this most important field then, that the universities and technological schools of the country prepare their young men. And it is because the quality of this technical talent is so frequently below what is called for, that I venture to draw attention to certain considerations on the subject, that may be of interest.

The method of teaching applied chem-

istry as now generally practiced, consists in describing, in a series of lectures, the manufacture of so many of the various acids, bases and salts as the professor can find time to present. Sometimes certain industry groups are selected, such as soda chemicals, explosives, dye extracts, coal tar products, and so on. But it is evident, on account of the endless array of chemical products, that it is impossible to cover the ground in any but the most superficial manner. It is also an even chance whether the student will ever afterwards be engaged in any of the few industries thus outlined by him in his lecture note book.

It should again be stated that the usual method of instruction consists in describing the manufacture of certain products; the preparation of this salt, that acid, or of that dye. It is invariably upon a series of such products that the classification of the lectures is based, and it is because the name of these chemicals is legion that the instruction must necessarily be incomplete and the knowledge gained vague and indefinite. While such instruction is, of course, better than none, and indeed should be continued, it should be relegated to the position in the curriculum to which it properly belongs, as being a part of the course in general chemistry adapted to all chemical students, but should not be the only groundwork for the training of the future technologist.

What is it that such a young man sees on entering one of our large chemical factories? He observes, on all sides of him, apparatus and machinery for grinding material, for elevating and transporting it. He sees materials under treatment in various ways and at all stages. He notices that in one building or department such and such operations are performed—it may be the solution of some article here, the filtration and washing there. Here he sees the processes of evaporation, or it may be of crystallization or of distillation and condensation. Elsewhere he observes a series of calcining furnaces. In another part of the works are the drying rooms. Many other processes he notices in full operation, of the object of which, and perhaps the very name of which, he is ignorant. The thought that is likely to be deeply impressed upon his mind is: "Why was I taught nothing of this in college?" His mortification is apt to be all the greater when he perceives the number of workmen about him who understand it all. There are foremen, heads of departments, machinists, carpenters and others, no one of whom, perhaps, can write a letter correctly, and yet all experts in their several lines; while he, a university graduate, has not even been taught the use of the tools of his trade.

It is evident that some system of instruction is necessary that is essentially different from that now in vogue. And it is the object of this paper to outline such a plan, which, it may be stated at once, consists in the teaching, not of products, but of processes, and in directing the attention not so much to the chemical, as to the apparatus. The subject can be discussed most clearly by presenting it under three headings: The lectures, the practical work, and the text book.

The Lectures.—Prof. Tyndall once observed that a man who had thoroughly mastered a scientific principle was in

possession of a key that would open many locks. A somewhat similar idea is here applicable; the important point being to place the learner in possession of the knowledge of one particular class of operations at a time, and to make that knowledge comprehensible and thorough, so that its application to any variety of purposes may be possible.

For example, let a series of lectures be given upon the reduction of materials to a fine state of division. The many kinds of crushers, chasers, mills, disintegrators and beaters should be described, especial attention being given to explaining the peculiar adaptability of each kind of such machinery to the physical properties of the substances to be treated. A thorough description of the practical working points of each type of mill should be laid before the student. In the case of an ordinary pair of forty-eight inch hubstones, for example, he would be taught such facts as the average horse power required to drive them, the usual output of the mill per hour, the speed at which it runs, the dress of the stone, and the different qualities of the materials from which they are made. The use of screens and bolting cloth would be touched upon, as well as the methods of handling the tailings. Some mills he would observe are capable of yielding a product large in quantity, but coarse in quality, while others can be used only under conditions exactly the reverse. Some forms of apparatus, like the disintegrator, can treat a damp or plastic material such as a superphosphate or sulphate of alumina, while others will handle dry and brittle substances only, to advantage.

An understanding of the essential principle upon which each of these forms of apparatus works would thus be obtained by the student, who would be able to apply the information, it may be years afterwards, in some distant fertilizing factory in Georgia, or in some remote refining works in the far west.

Continuing in the same line of thought, another series of lectures would be given upon filtration, frequently one of the most difficult of chemical processes. It could be shown how a coarse open substance (like black ash, for instance) can be washed in masses of considerable depth, while others, of a closer or denser nature, like lime-mud or calcium sulphate, must be handled in what, to the tyro, would appear to be amazingly thin and extended surfaces. It would be pointed out how some substances, like gelatinous hydrate of alumina or precipitated ferric hydrate, cannot be filtered at all, practically, on a large scale, but must be washed by decantation. The construction of filters, the selection of proper materials for the filter bed, the application of a vacuum, the handling of the different wash waters, the use of filter presses, and of centrifugals, all of these matters would be discussed in sequence. This would form a scientific classification of the subject that would be valuable to the student, enabling him to apply the information to the preparation of any kind of chemicals, let them be fine pharmaceutical preparations or heavy bulk goods that are made in large quantities.

The method of evaporation of liquids could next be studied, describing the plant necessary for under-heating, for surface heating, and for coil evaporation. The treatment of solutions with gases,

*Read before the World's Congress of Chemists, August 26, 1883, Jour. Amer. Chem. Soc.

the methods of uniformly mixing solids with liquids, the erection and use of reverberatory furnaces, the transportation of solids by elevators, conveyors, belts or link chains, the lifting of liquids, acid or alkaline by pumps, injectors or compressed air; in a word, all the important processes in use in chemical engineering would each, in turn, form the subject of a series of lectures.

In teaching applied chemistry in this manner the important point gained is that the learner's mind is occupied by one class of subjects, or processes, at a time, thus giving him a practical knowledge of each important department of manufacturing chemistry, entirely irrespective of what kind of goods are produced. This is in sharp contrast to the present systems, in which his mind is bewildered by the numerous details involved in the description of the heterogeneous series of chemicals. He perceives that the forms of apparatus in use in the factory are simply so many tools, the construction and use of which he must learn in order to obtain the results, and that when equipped therewith he is "in possession of a key that will open many locks."

The Practical Work.—The study of analytical chemistry, although an excellent training for the mind, has one element of weakness; the learner is taught to depend entirely upon authority. He is obliged to follow out, to the very letter, the methods prescribed by the text book. As a result, he necessarily foregoes any attempt at original work, and as a specialist in analytical chemistry is frequently (in fact, almost always), incapable of supervising any other work than that of the laboratory.

The remedy for this is to catch the chemist when he is young, and introduce him to the methods used on the large scale. It is seldom possible to obtain for the student the entire to chemical works. Such a request is generally declined without thanks. And as the chemical works cannot be brought into the college, it remains that there be established there certain methods of work requiring the same processes of reasoning and the same methods of attacking the problems that are in use in the actual factory.

The important fact, so far as apparatus is concerned, can be obtained from the lectures, and still more fully from the text book. But in regard to the methods of working, valuable information can be had from synthetic experiments of the simplest nature. And it is in such investigations that the student should be well drilled. As an example of the points that can be illustrated in this manner, let a student be required to make, for instance, some copperas, for which purpose he may be furnished with a few ounces of iron nails, some oil of vitriol, a number of large dishes and a funnel. He determines the strength of the acid, using both Twaddle's and Beaume's hydrometers, thus learning the use of these instruments. Converting this into specific gravity he obtains from the tables the percentage of actual SO_3 in the acid, and from that the volume of vitriol required for the given weight of iron. He next calculates the quantity of water necessary to supply the water of crystallization of the salt, as well as that required to hold it in solution, and by this means becomes familiar with the use of tables of solubilities. After solution of

the iron and filtration, he measures the total bulk of the liquid, which is then evaporated to the crystallizing point, and again measured. The conditions most favorable to crystallization are now studied, the weight of crystals obtained and the percentage yield as compared with that of theory, computed. Analysis of the mother liquor will check this, and will familiarize him with the method of calculating milligram per cubic centimeter into pounds per cubic foot.

He is now in position to estimate the size of the vessels necessary to treat a batch of, say, 1,000 pounds of iron, and can, on paper, erect a dissolving tub, filter, evaporating tank, and crystallizer, all of the proper shape and proportion. The best thickness of lead for lining these tanks can be determined, its weight calculated and also its cost. Assuming a price for the iron and vitriol, the cost of these ingredients per ton of crystal can be easily figured out. And all of this from a bottle and a few ounces of iron nails.

This little example is given merely as an illustration of what kind of work can be done. It can, of course, be varied in many ways and with many materials. It matters not a particle upon what salt or preparation the student is put to work. As a matter of fact, the above example would never be put into practice on the large scale, since copperas is nearly always produced as a by-product from other operations, or is made by the weathering of marcasite.

But the training that he receives will teach him the importance of observing the physical properties of substances in the various stages of treatment. By discovering the difficulties to be met he acquires the art of making mistakes on the small scale. The lack of such experience has undoubtedly been the cause of the loss of immense sums of money in many instances.

The Text Book.—To this entire subject of industrial education, as herein described, there is one objection that may be made, namely: What is to prevent such a series of lectures becoming antiquated and out of date in the course of a few years? The answer is to be found in the literature of the subject. How many text books on qualitative analysis are there in existence? As every chemist knows, they are numbered by the score, if not by the hundred. In what important particular does any one of these text books differ from the others? What new fact does it contain? If, now, a subject so utterly thrashed out as qualitative chemical analysis can thus be again and again discussed, what is to prevent the establishment of a series of treatises on chemical technology, by which the whole subject can be brought under control and properly classified? It is important to note that such treatment of the subject would of necessity be cumulative. The experience of one writer would thus be collected and embodied in the treatise of another. The weak points of one text book would be made good in its successor, or in the second edition. The mere fact that no such treatises are in use to-day is precisely the most imperative reason why they should be introduced.

Such a manual would follow the methods indicated in the foregoing. Its object would be to describe, not products, but processes, and it would be to the apparatus and methods of treatment that attention would be given. It is needless

again to go over the ground previously covered, more than to say that each particular class of operations in use in a factory would be treated separately in the proper chapter. In other words, the book would supplement the lectures. The illustrations and plans to scale would describe actual working apparatus and the student would be taught how to handle precipitates and solutions by the ton, just as, in analytical work, he learns to manipulate them in quantities represented by the gram and cubic centimeter.

In addition to such a treatise, the student should be allowed the use of the various journals on chemical technology that are published in the German and English languages. To these should be added the trade journals, of which there are quite a number, and even such material as manufacturers' catalogues and illustrated price lists will be found to contain information of much value upon subjects relating to the supplies needed in all factories.

In conclusion it may be acknowledged that this plan of instruction is essentially a utilitarian one. This is in accordance with the general drift of the scientific education of to-day. To use Lord Bacon's expression, the aim is to gather fruit, not flowers. The training of the mind will incidentally be one of the results of such a system. But the main object will be the imparting of actual knowledge and the teaching of specific facts. The manufacturing chemist who has to meet the difficulties that constantly arise in the practice of his profession is like a man who is lost in the Alps. What he wants is not to improve his mind, but to find the way. The present system of instruction does not meet the requirements made upon it. It teaches the principles of the science, but does not go far enough. As Macaulay said of the ancient philosophers, every trace of intellectual cultivation is there, except a harvest. The subject of industrial chemistry evidently has not received the attention it deserves in our schools of science.

THE CROSS FERTILIZATION OF THE SCIENCES.*

By Robert B. Warder, Washington, D. C.

Science has been defined as knowledge classified; and there are philosophers whose special anxiety is to find pigeon holes duly arranged in rank and file, where the several classes of facts can be stowed away in order like the various genera and species of a fauna or flora. But the boundaries of a science, as of a biological species, can not always be defined. Hybridism in knowledge, as in husbandry, yields offspring of special value. The late Dr. Gray was wont to exhibit the wonderful natural contrivances of the orchids, by which each pistil should not be fertilized by its own pollen, but by that from some other flower. To this habit, no doubt, is largely due that wonderful development of form and color. The practical stock-raiser or horticulturist, with an ideal sheep, or cotton plant, or chrysanthemum, in his mind, proceeds to select and unite the parents, combining the several desirable characteristics, so that the product more and more closely approaches his ideal.

*Opening address, August 25, 1893, to the World's Congress of Chemists. Section of Physical Chemistry. Reprinted from Jour. Am. Chem. Soc.

So, also, in the evolution of science, the most striking developments appear in the judicious combination of distinct parents.

The laws of planetary motions lay hidden, until mathematical analysis under Kepler and Newton joined hands with the long record of nightly observations. In more recent times, a "new astronomy" has arisen, counting its parentage from the old astronomy on one side, and from physics on the other. The presidential address to the American Association on orology, sought to trace the history of the mountain range, by uniting the studies of mathematical physics with stratigraphical and dynamical geology.

It is especially true in the problems of daily life, that conclusions must be reached, not belonging to any one line of investigation, nor to two, but to nearly the whole range of science. A dairyman, for example, with one hundred acres of ground, wishes to produce as many pounds of butter as possible. Geology may contribute to the interpretation of his soil; biology is directly concerned with his pasture and his herd; chemistry and physics deal with the processes of feeding; and manufacture; while the best market for the butter and utilization of by-products must conform to the laws of political economy.

It is needless to multiply such illustrations. The manufacturer and the engineer, can never say of any kind of science, "That will be of no use to me." A life-time may be spent in luxuriating in the riches of any one science (if one has leisure for such luxury), but the most important and fruitful outcome in our day, is usually the product of different sciences.

The fertility of such union is especially noteworthy in chemistry and physics. Look at some examples from the papers just read in this congress. Prof. Prescott, in discussing advances in analysis reminds us of optical and thermal determinations, and of those based on solubility, capillarity, etc. The chemical world, he says, is alive to the new physical chemistry, and none are more indebted than analysts. The same fact is further illustrated in the distinguishing properties of olive oil as set forth by Prof. Risng. The proper adjustment of potential and current is required in electrolytic separations; and the speed of chemical action (varying with the temperature) must be responsible for many discrepancies in the estimation of citrate-soluble phosphates.

Passing to organic chemistry, the question introduced by Prof. Witt, "Why Make So Many Dye-Substances?" led us to the absorption (or subtraction) theory of the mixture of pigments, as distinguished from the addition theory, applicable to physical colors. Still more singular is the extension of the theory of solution to cover the nature of dyed wool, silk, or cotton, where the dye must be selected with due regard to its solubility in the fiber to be colored. In this industry, conditions of chemical equilibrium are especially important.

The scientific and statistical basis for the assessment of farms has been discussed by Professor Thoms. The principles of political economy involved may be referred to those officials who require the farmer to pay more than his share of tax, but the subject of values was seen to be closely linked to both the chemical composition and the physical properties of the soil.

To review the papers on technological chemistry and to point out all the fruits of cross-fertilization between chemistry and physics, would tax patience too far. Some of the more striking illustrations are found in the apparatus for rapid removal of latent heat from vapor or nitric acid as described by Dr. Hart; the judicious selection of a solvent for the electrolysis of alumina, and the economical preparation of a disinfecting fluid by electrolysis of sea water as discussed by Professor Langley.

In all operations and needs of daily life, we find chemical substances adapted to their several purposes in virtue of their physical properties. For many years the discussion of density, solubility, optical, thermal, and electrical properties, crystalline form, etc., were grouped under the name of chemical physics. A vast store of facts was accumulated, of somewhat empirical character, like a valley of dry bones. A new life has appeared with the recent developments of the doctrine of energy. The old name takes a new form. The old numerical data have been greatly extended with the addition of broad generalizations. Physical chemistry is the order of the day. But what is this physical chemistry? And what is it for?

Nearly twenty years ago, a chemical student in Berlin was using costly organic materials by the hectogram or kilogram to prepare some new compound in quantities barely sufficient for analysis. Looking forward he dreamed of some general laws yet to be discovered, by which it might be known whether a given blackboard equation would or would not find its counterpart in the laboratory without the necessity for such expenditure of time and material to prove each point. Are we not to-day somewhat nearer the realization of that dream?

We form a plan and want to know whether it will work. We put it into execution and find it works in part. There are losses, sources of waste that must be overcome before the process can fulfill our wishes. We now ask, not merely, will it work? but how far will it work? And this is the very question in its general form which occupied the mind of J. Willard Gibbs about the same time that the student was indulging in his reveries. The result was a paper, "On the Equilibrium of Heterogeneous Substances," a paper bristling with differentials and integrals, with the merit of applying equally to physical and to chemical operations. It presents the fundamental principles of change or non-change in general terms, requiring only the proper application of minor premises to yield the particular facts desired. Experiment is still made to find the minor premise, but rapid progress has been made.

This is abundantly shown by Professor Oswald's last volume on chemical energy, covering more than 1,100 pages. This distinguished author has very kindly sent us a brief review of the leading principles in the paper next on the programme.

Sooner or later this new heaven will doubtless be felt in agriculture, in technology and in biology. Already we find a special chair of physical chemistry in Cornell University, from which we shall hear further. Other universities may do well to recognize this middle field in fixing the limits of the several professorships. The time is at least ripe for a general acquaintance with the subject.

PHARMACY.

GODDARD'S GARGLE. In 6 ounces of boiling water digest 2 drams alcohol, 1-2 ounce pomegranate bark, 1 dram red rose petals, and 1 ounce honey, strain. Can be used without dilution or with an equal quantity of water.

CHILLBLAIN OINTMENT. For an application which is very serviceable in cases of chillblain where the skin is broken or badly abraded and very sensitive, there is recommended an ointment composed of 2 drams turpentine ointment, 11-2 drams elemi ointment, 11-2 ounces zinc ointment.

ADULTERATED TINCTURE OF RHUBARB. They are not so lenient in England as here with those who are found guilty of selling adulterated or even delicate strength drugs. In a recent instance a firm was convicted of selling tincture of rhubarb entirely destitute of saffron and containing over 65 per cent of water. The judge imposed but a nominal fine, but remarked that in future cases the full penalty of 20 pounds would be exacted, as the practice was a most dangerous one.

A NEW EXPLOSIVE. The Chemist and Druggist publishes a very brief statement concerning a new explosive upon which M. Raoul Metet has been working. This explosive is a liquid which is said to exceed all known explosives in power. It is said to be uncongealable and to burn smokelessly, while its preparation and transport are entirely free from danger. The Swiss military authorities have already made experiments with it and the prospect is that they will soon decide upon the purchase of the process of manufacture.

TRANSPARENT LEATHER. The Popular Science News translates from foreign source the following process for the manufacture of transparent leather: The hair is removed from the hide, which is then tightly stretched upon a frame and thoroughly rubbed with a mixture of glycerine 1,000 parts, salicylic acid, 2 parts, picric acid 2 parts, and boric acid 25 parts. Before the hide is thoroughly dry it is placed in a room which the sun does not penetrate and is then saturated with a solution of bichromate of potassium. After it is thoroughly dried, an alcoholic solution of tortoise shell is applied to its surface, giving a transparent aspect. The leather thus produced is very flexible and appropriate for the manufacture of toilet articles, etc.

MEAT EXTRACTS. The public analyst of Glasgow has been examining into the relative values of some of the leading brands of extract of beef and Public Health reprints his report, made to the chief sanitary inspector. The analyst entered upon his investigations with a view of ascertaining whether the following points were well carried out in the manufacture of the several extracts, viz.: 1. Freedom from water in excess; 2. freedom from fat; 3. palatability. He denies the prevalent belief that meat extract contains more nutriment than the same weight of meat, for no extract can contain more than the soluble parts of the beef, which are only one-fifteenth or less of the weight of the beef itself. The following table represents the results of his examinations:

	PER CENT.			
	Bovril Fluid Beef.	Liebig's Extract of Meat.	Valentine's Meat Juice.	Brand's Essence of Beef.
Water	29.42	10.75	51.40	50.48
Either Extract	0.56	0.08	0.64	TRICE.
Albumen, Peptones and Gelatin	14.67	17.91	7.66	4.88
Chlorides	37.01	42.20	18.56	2.48
Non-Nitrogenous Extractives	19.34	8.59	11.96	0.47
Mineral Matter	18.43	20.74	10.88	1.24
Protein solids	100.00	100.00	100.00	100.00
Yeast	79.68	80.21	48.60	9.62
Yeast from which the food sample is derived	2.028	2.028	2.93 0/28	2.93 0/28
Yeast of lean least beef required to make 1 lb. of extract	24.6	27.6	17.5	4.1
	12.3	13.8	7.5	1.6

Referring to the qualifications, stated above, which the beef extract should have the analyst says that: "In making a comparison of the relative values of these samples, it is only necessary to determine how far they comply with the above requirements. Bovril does this within 20 per cent, but it is but fair that allowance should be made to this extent for water necessarily present to keep the extract in a soft state. Liebig's also complies with these conditions, and even more closely, as this extract shows little over 10 per cent of water, but it is an extra dry one. Valentine's, containing as it does, over 50 per cent of water, does not fulfill these conditions, so that after allowing for 20 per cent water, it might well be 30 per cent stronger. Brand's extract is scarcely an extract at all in anything else than the name, as is obvious from the fact that it contains over 90 per cent of water, so that after allowing for 20 per cent water it might contain 70 per cent more dry extract of beef."

FLUORINE.

The "Demonstration of the Preparation and Properties of Fluorine by Moissan's Method," by M. Moissan's assistant, Dr. Meslans, was the popular event of the proceedings in the chemical section of the recent meeting of the British Association, and is described by Engineering (Sci. Amer.) as follows: Some years ago M. Moissan isolated fluorine, which so far had baffled all attempts at separation, and in a measure remained a hypothetical element.

M. Moissan, regretting his inability to come himself, sent over his assistant with a full plant, which was exhibited. M. Meslans contented himself with demonstrating, making brief remarks in French, and converted all doubters. If any were present, into enthusiastic believers. Fluorspar is decomposed in a platinum retort by means of sulphuric acid, and the anhydrous hydrofluoric acid, dried and purified, brought into a U-tube for electrolytic decomposition. The vessels and tubes are of platinum; the stoppers of fluorspar. The hydrofluoric acid is an insulator, and resisted all electrolytic attacks until Fremy

suggested the addition of a fifth fluoride of potassium. The U-tube stood in a cooling vessel of about a quart capacity, containing condensed methyl chloride, which reduces the temperature to negative 23 degrees Cent. As soon as the current of 70 volts and 25 amperes was turned on, minor explosions were heard and fumes began to issue from the platinum fine tube through which the fluorine was to escape into the air. It did so; and, although it did not appear so vicious as it has been described, soon set the crowded audience coughing and longing for fresh air. Nobody was any the worse for it, however. As the fluorine at once decomposes, with the moisture in the air, into hydrofluoric acid and ozone, these two substances were practically what was smelt and felt; ammonia was passed round instead of eau de cologne. The experiment had to be temporarily interrupted after some minutes, as the stock of methyl chloride gave out; M. Meslans had been experimenting the day previous. The low temperature is necessary on account of the high volatility of the hydrofluoric acid. As, however, some of the potassium salt, carried over by the violence of the reaction, stops up the discharge tube, which is the size of a clay pipe stem. Dr. Meslans was constantly applying his Bunsen to heat the tube. Iodine at once combined with fluorine under explosion; sulphur burned with its well-known blue flame; phosphorus as in oxygen; silicon and boron glowed like burning coal; carbon itself would not catch fire. It does so under proper conditions. On the motion of Sir Henry Roscoe, the thanks of the association were conveyed to M. Moissan by wire. Dr. Thorpe said that M. Moissan had been kind enough to examine his apparatus, which he had sent over to Paris; but that he, however, had not been able yet to repeat the experiment. On the request of the president, he gave a summary of the properties of the now fairly settled refractory element. It attacks everything—even the platinum-iridium electrodes. As to its appearance, even Moissan can hardly speak, as it cannot be brought into transparent vessels, and fumes so badly. It seems to be a greenish-yellowish gas, like chlorine. Its atomic weight Moissan has determined by filling two exactly equal platinum jars with nitrogen, and replacing in the one the nitrogen by fluorine; since the atomic weights of nitrogen (14) and fluorine (19) do not differ much, however, this determination is not very reliable. M. Meslans also exhibited one of Moissan's latest products, uranium carbide, obtained in his electrical furnace. This is a dull blackish mass, which, when shaken in the stoppered bottle, sparks most energetically; the carbide, or its combustion product, has a peculiar smell.

VINEGAR.

While vinegar is used in the daily meal, yet it passes as something never questioned and little known about. It is a condiment upon which much of the delicate flavoring of food depends. Its mere "acidity," however, is not the only requisite to a good quality. Originally vinegar, as its name implies, was made only from wine. It was the only acid known to the ancients. In 1648, Glauber, the celebrated chemist, speaks of a product obtained by the dry distillation of wood in a way which shows his appreciation of its identity with vinegar, and states

that by rectification it can be made as good as wine vinegar.

It is very difficult, in modern manufacture, says National Grocer, to give a precise definition of this product. The so-called vinegars of commerce may be chemically divided into two classes; those which are the consecutive alcoholic and acetous fermentations, and those which are not. Under the first-class come those made from first, wine; second, spirits; third, malt-wort or beer; fourth, fermented fruit juices other than wine; and fifth, sugar beets. Under the second class, vinegar manufactured from the destructive distillation of wood forms the chief variety.

The wines used are both red and white, of inferior quality, or considered unfit for drinking. New wines are not good for this purpose, as they are apt to undergo putrid or rosy fermentation. In addition to acetic acid, the wine vinegar contains various acids, but especially tartaric and succinic, the latter imparting the peculiarly agreeable flavor and odor. The spirits used are chiefly the potato brandy of Germany and whisky in this country. This makes really an artificial wine vinegar containing only water, acetic acid and a small quantity of acetic ether. Cider and perry are about the only fruit juices besides wine fermented for the production of vinegar. Malic acid is its characteristic flavoring element. Beer, grain, or malt-wort vinegar contains extractive matters, as dextrine, nitrogenous substances, and phosphoric acid. Sugar beets are used somewhat in France.

At the present time the Society of Public Analysts of London is investigating the manufacture of vinegar. They do not enter upon a hygienic examination, but urge the necessity of government inspection and proper labeling; the same point that has so frequently been urged in the bulletins of the United States Agricultural Department. The fictitious vinegars are mostly pyroligneous acid, with acetic ether added as a flavoring, fusel oil, oil of cloves and butyric ether added to give aroma. Sulphuric acid is sometimes found in cheap vinegars, its purpose being more to prevent putrefaction than an adulteration.

Briefly, the theory of the manufacture of vinegar is this: All oxidizing agents convert alcohol first into aldehyde and then into acetic acid. Fermented liquors, when exposed to the air, soon become sour. This depends upon the fact that they contain nitrogenous compounds which act as carriers of atmospheric oxygen. This, however, can only take place when the percentage of alcohol does not exceed a certain limit. It is for this reason that strong wine, such as port or sherry, does not become sour on exposure to air. This oxygen-carrying body is the acetic ferment. This ferment is always floating in the air, and when it falls into conditions suitable for its development it very rapidly multiplies. These ferments grow on the surface of the liquid where the oxygen is, forming a gelatinous skin, which by its increasing weight falls to the bottom. Another skin forms and this process goes on till the liquid is exhausted of its assimilable material. The skin, called the "mother of vinegar," consists of a multitude of the minute ferments. One hundred pounds of alcohol require three hundred pounds of air to convert it into active acid.

NEW REMEDIES.

HEININE is another of the many euphoniously named preparations, which, within the past two or three years, have come to attention. A physician contributes to the Homeopathic News a careful account of his experiences with this article, but neglects to state its particular character. He uses it by hypodermic injection for the treatment of hernia and claims to achieve excellent results. Without particular reference to this case, we would suggest that someone invent a Brainine, the injection of which might serve for the improvement of the brain power of some of our inventors of so-called medicinal preparations.

FERRATIN is a compound of iron which Smilesberg claims to have obtained from the liver of the hog and finds to contain 6 per cent of iron. It appears in commerce as a fine reddish-brown powder, of two varieties, one insoluble and the other a sodium combination, easily soluble in water, but to make this a soluble compound it is necessary that the water be free from lime to prevent precipitation of calcium ferratin. A solution of the sodium compound is recommended as an addition to infant's food, while either form is well administered in powder. From one and one-half grains to seven grains daily for children and from 15 to 22 grains for adults, given in one dose or divided into two or three. Acid foods should be avoided during administration of the remedy.

PHARMACY OF BROMOFORM. This drug has found more or less successful application in the treatment of whooping cough, and directions have generally been given for its dispensing in aqueous solution assisted by a little alcohol. W. Lyon, in a paper read before the Edinburgh Pharmacists, Assistants and Apprentices' Association recently, stated that a prescription of this character was handed to him for compounding. He found that the bromoform dissolved readily in the alcohol, but separated upon adding the requisite quantity of water and would not again dissolve on shaking. Upon the advice of the physician, sufficient alcohol was added to give a solution, but it proved unfortunate to the patient, a child, in that the toxicating effects of the alcohol were very noticeable. Therefore, the author experimented to arrive at some satisfactory pharmaceutical combination of bromoform for medicinal administration. He obtained fairly satisfactory results by the use of mucilage of acacia. Mucilage of Irish moss was similarly satisfactory, though with both of these a slight separation of the bromoform occurred, but was readily distributed through the water on being shaken. Tragacanth was a failure, and various other mixtures tried did not give fully satisfactory returns. The conclusion of his work was in favor of a mixture of which the following is a type: Bromoform, 16 minims, alcohol 2 drams, glycerine, 12 drams, compound tincture of cardamoms, 2 drams, mixed in the order named. This combination was that advised by the late P. W. Bedford, and proves to be the best yet presented for the administration of bromoform.

FORMULARY
AND
QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.
Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

QUESTIONS ANSWERED

Correction.

By a transcription in the "makeup" of page 552, December 15, 1893, Era, the four lines required to complete the query on "Insecticides for Agriculturists' Use" in the last column, were made to appear at the bottom of the first column. They should appear at the bottom of the third column.

5843. Puley's Cream.

(H & C.) See Era of December 15, 1893, page 549.

5840. Frostlin.

(H & C.) See formulas in the reply to query No. 5827, December 15, 1893, Era, page 549.

5841. Oklahoma Board of Pharmacy.

(L. A. H.) The secretary is C. P. Wickmiller, Kingsfisher. The board will hold its next meeting at El Reno on the first Tuesday in January, 1894. Full information may be obtained by writing the secretary at the above address.

5842. Hazeline Cream.

(P. M.) Try the following:

Lanoline 4 ounces.
Soft paraffin 4 ounces.
Witch hazel extract (N. F.) 2 ounces.

Incorporate thoroughly.

5843. Francoina.

(H & C.) The following was published in the Amer. Drug. for producing a similar article:

Prepare a thick, almost jellylike infusion of flaxseed, and add to it 20 per cent of its volume of glycerine, with which has been mixed sufficient salicylic acid to make the finished product contain 2 grains in each fluid ounce. Perfume according to taste.

5844. No-To-Ilac.

(A. F. R.) Most of the so-called tobacco cures, we believe, contain tonic and aromatic substances such as gentian, Canada snakeroot, etc., and some are said to include coca leaves. The principal aim of all of them is to divert the attention from the craving for tobacco and to satisfy this craving by substituting indifferent substances which are either nauseous or pleasing to the taste. Some experimenters work in one direction, and others in another. For more extended remarks on the subject, see Era, October 1, 1893, page 393.

5845. Lithiated Hydrangea.

(L. C. R.) The manufacturers state that each fluid dram "represents thirty grains fresh hydrangea and three grains pure benzo-salicylate of lithium." The following formula is suggested as making a similar preparation:

Lithium carbonate.... 120 grains.
Lithium benzoate 60 grains.
Fluid extract hy-
drangea 1½ fl. ounces.
Alcohol 2 fl. ounces.
Water 13 fl. ounces.
Mix, dissolve and filter.

5846. Solution Bromides Compound.

(C. G. & L. A. H.) Try the following:
Potassium bromide, 640 grains.
Sodium bromide, 512 grains.
Ammonium bromide, 128 grains.
Calcium bromide, 128 grains.
Water 4 ounces.
Alcohol 2 ounces.
Orange wine, a sufficient quantity to make..... 16 ounces.
Caramel to color.

See also Era of June 15, 1893, page 542.

5847. Sel de Gregory.

(B. T. S.) This is the name applied by the French Codex to a mixture of the hydrochlorates of morphine and codeine, as precipitated from an aqueous solution of opium by chloride of calcium. The process for the preparation of morphine hydrochlorate in the British Pharmacopoeia, employs chloride of lime to precipitate the morphine and codeine as hydrochlorates, the morphine hydrochlorate thus formed being afterward decomposed by ammonia, the morphine subsequently washed and treated with hydrochloric acid. This process was first presented by Dr. Gregory, of Edinburgh, and adopted by the Edinburgh College, hence the name. His process is substantially that employed by the British Pharmacopoeia at the present time.

5848. Syrup of Turpentine.

(T. B. T.) The following is taken from the Era Formulary:

White turpentine..... 1 ounce.
Tincture of tolu..... 4 fl. drams.
Magnesium carbonate... 4 drams.
Glycerine 2 fl. ounces.
Acacia 2 ounces.
Sugar 20 ounces.
Water sufficient to make 24 fl. ounces.
Triturate the turpentine, tincture of tolu and magnesium carbonate well together, gradually adding 6 fluid ounces of water, and filter. In the filtrate dissolve the sugar and acacia and add the glycerine and sufficient water to make 24 fluid ounces.

5849. Kennedy's Pinus Canadensis, White.

(F. & C.) The following formula was published in the Pharm. Rund. several years ago as making a very similar preparation:

1. Zinc sulphate..... 10 parts.
Glucose 20 parts.
Water 70 parts.
Oil of hemlock..... a few drops.

Here is another from the Times and Register:

2. Zinc sulphate..... 1 dram.
Glucose 1 ounce.
Water enough to make..... 16 ounces.
Flavor by adding oil pinus sylvestris.

5850. Detannating Substances Containing Tannin.

(L. F.) asks for a simple and practical process for depriving substances of their tannin. This may be accomplished by adding to the preparation to be detannated any substance which will combine with the astringent principles and form precipitates which may be removed by filtration. Freshly precipitated ferric hydrate, albumen and gelatine are all used for the purpose, as they readily form precipitates with vegetable astringents. Of the processes suggested that one using freshly precipitated ferric hydrate is, in our estimation, best adapted for the purpose. It may be a little tedious, but it is simple, practicable and thorough. A complete working process

The chemist wrote it "Inorganic analysis," but the printer set it "Ignoramus analysis."

may be found in the National Formulary under the formula for Detannated Tincture of Cinchona.

5851. Wheat Grain For Poisoning Mice.

(J. E. H.):

Wheat (whole).....	2 pounds.
Nitrate of strychnine....	45 grains.
Fuchsine	q. s.
Saccharin	15 grains.
Water	q. s.

Dissolve the nitrate (or any other salt) of strychnine in a pint of water, which has been colored with a sufficient quantity (about 4 grains) of fuchsine. Introduce the wheat into this liquid and macerate for one or two days, until the wheat has soaked up all the liquid. Then drain the wheat, dry it partly, and impregnate it with a solution of the saccharin in about 4 ounces of water, prepared with the aid of a little bicarbonate of sodium (or with a mixture of $\frac{1}{2}$ fluid ounce of solution of saccharin (Nat. Form.) and $\frac{3}{4}$ ounces of water.

5852. Extract of Cannabis Indica in Aqueous Mixture.

(J. F. A.) asks how to incorporate solid extract of cannabis indica in an aqueous mixture, as some manufacturers claim to do. We do not know. Extract of cannabis indica is a very resinous preparation and comparatively insoluble in aqueous solutions. The only way in which any extract might be dissolved in the mixture would be by making it alcoholic, or it might be suspended in an aqueous mixture by introducing some emulsifying agent, as is done in the National Formulary in the formula for compound extract of chloral and bromide of potassium. The presence of very much alcohol in a mixture like the formula cited, would be inadmissible, inasmuch as a reaction is likely to occur between the chloral and the alcohol, especially when the latter is present in more than very small quantities. See also note in the National Formulary under formula for Compound Mixture of Chloral and Potassium Bromide.

5853. Fluid Extract of Eucalyptus in a Prescription.

(O. A. R.) asks if the following prescription can be compounded without forming a precipitate or sediment:

Fluid extract eucalyptus.....	1 ounce.
Fluid extract glycyrrhiza.....	3 drams.
Ammonium muriate.....	2 drams.
Syrup of tolu sufficient	
to make.....	4 ounces.

The question as to turbidity involved in this prescription is similar to that asked in another query, the difficulty arising from the insolubility of the resin of the fluid extract of eucalyptus in the syrup of tolu. By substituting alcohol for part of the syrup of tolu a clear mixture may be obtained, taking care, however, to retain enough water in the mixture to dissolve the ammonium muriate. Such substitution should not be made without the consent of the prescriber.

5854. Sympathetic Ink.

(L. A. H.) Here are several formulas from the Era Formulary:

1. A weak solution of nitrate of copper gives an invisible writing, which becomes red through heat.

2. A very dilute solution of perchloride of copper gives invisible characters that become yellow through heat.

3. Solution of chloride or nitro-muriate of cobalt turns green when heated and

disappears again on cooling. If the salt is pure, the marks turn blue.

4. Onion juice; will become yellow when exposed to heat.

5. Oxide of cobalt..... $\frac{1}{2}$ ounce.
Muriatic acid, sufficient to dissolve it.
Water

4 ounces.
Mucilage of gum acacia..... 1 dram.
Characters written on paper with this solution are invisible, but on the application of heat they instantly appear in blue. On cooling they become invisible again.

5855. Acetanilid Compound.

(D. W. B. T.) Here are some formulas for acetanilid compound. You can take your choice.

- 1) Dr. Fitcher's formula—
Acetanilid

2½ grains.

Fluid extract gelsemium. 1 minim.

2) Dr. Gray's formula—
Acetanilid

2½ grains.

Caffeine citrate..... 1 grain.

Gelsemium

1-10 grain.

3) Acetanilid

2½ grains.

Tully's powder..... 3 grains.

4) Acetanilid Compound for Migraine—
Acetanilid

2 grains.

Camphor monobromated. $\frac{1}{2}$ grain.

Caffeine citrate..... $\frac{1}{2}$ grain.

See also Era of September 1, 1893, page 204.

5856. King's New Discovery.

(E. J. V. N.) This is a proprietary preparation, and, of course, its exact composition is unknown to us. The American Druggist, however, is the authority for the statement that the preparation is very similar in composition to one made according to the following formula:

Sulphate morphia..... 8 grains.

Fluid extract ipecac..... $\frac{1}{2}$ dram.

Chloroform

60 drops.

Tincture white pine..... 2 ounces.

Water

7 ounces.

Carbonate magnesia..... $\frac{1}{4}$ ounce.

Sugar

14 ounces.

Rub the magnesia with one ounce of the sugar in a mortar, and triturate with the tincture of white pine and the fluid extract of ipecac; gradually add the water and triturate with the mixture in the mortar. Filter, and dissolve the sulphate of morphia in the filtrate; mix the chloroform with the rest of the sugar in the bottle and add the liquid above.

5857. Iron Pyrophosphate and Phosphoric Acid.

(L. M.) Criticism is asked upon the following prescription:

Arsenous acid..... 0.016 grams.

Strychnine sulphate..... 0.016 grams.

Iron pyrophosphate..... 4.0 grams.

Phosphoric acid dilute..... 32.0 grams.

Syrup of ginger..... 32.0 grams.

The difficulty in this prescription arises from the fact that the Pharmacopoeial dilute phosphoric acid is incompatible with pyrophosphate of iron. When combined a gelatinous precipitate is produced. This precipitation can be obviated by using the same amount of dilute metaphosphoric acid of the National Formulary, which represents an equal acid strength to the dilute tribasic acid of the Pharmacopoeia. A clear mixture cannot be made from the prescription as it stands. Before any substitution be made, however, the prescriber should be informed of the reaction, so that it can be remedied. It remains for him to decide whether the therapeutic value of

the metaphosphoric acid is the same as that of the tribasic acid of the Pharmacopoeia.

5858. Sweetening the Feet.

(L. S. & B.) Here are a number of formulas taken from the Era Formulary: 1) Potassium permanganate. 20 grains.

Water

2 ounces.

Apply to the soles of the feet and between the toes on retiring.

2) Chloral hydrate..... 2 scruples.

Water

1 ounce.

Apply to the soles of the feet and between the toes on retiring.

3) A 5 per cent solution of chromic acid applied to the feet after bathing and thoroughly drying them. Apply with a brush. Two or three treatments are sufficient.

4) A powder composed of salicylic acid, soap, talc and starch. The powder renders the feet firm, induces an agreeable softness, and removes all unpleasant odor, its action being to prevent the formation of butyric, valeric and other acids of the same family, which injure the feet.

5859. Ingrowing Toe Nail.

(E. S. E.) is sometimes caused by wearing narrow-toed shoes, and neglecting to keep the nails properly trimmed and from accumulations of foreign material. In treating the affection, the parts should be relieved of all pressure, and only broad and roomy shoes should be worn. The nails should be trimmed square across; the corners allowed to extend beyond the flesh. Remove all foreign matter from the seat of inflammation, apply a coating of collodion and then gently insert absorbent cotton or lint between the nail and the sore parts. If necessary, the absorbent cotton may be held in place by a piece of adhesive plaster around the end of the toe; renew every day until a cure is effected. Another very rational method employs a 40 per cent solution of caustic potash, which is first applied to the nail, and after a short time it is scraped with glass. The application and scraping are alternately repeated, until the nail is reduced to the thickness of writing paper, when it is raised out of the groove and the incurved portion excised. One advantage of this practice is, that the patient is generally able to follow his usual avocation without the loss of any time. For another method see Era of December 1, 1893, page 499.

5860 Mounting Photographs on Glass; Ivory Type.

(B. C. W.) Make a good print on plain paper; if the portrait is that of a fair person let the tone of the print be warm, if a dark person let it be cold tone. The print has to be colored on the surface as an ordinary colored miniature, only coloring it stronger to allow for the toning down it will presently receive. In this stage it will look like an ordinary photograph over-colored. The next point is to communicate to it the softness, creamy delicacy and transparency of an ivory miniature. This is effected by attaching it to white plate glass by white wax and gum dammar. Melt in a jar by gentle heat 2 ounces of the best white wax, and add a piece of gum dammar about the size of a hazel nut. When these are thoroughly mixed place a little on the clean glass plate which is to receive the picture. Heat the plate gently, and when the gum and wax melt and flow over the

plate, the colored photograph must be carefully laid down on the melted wax, the greatest care being taken to avoid air-bubbles and to preserve an equal layer of wax all through. Should air-bubbles show when the plate is cold, or the wax appear unequally thick, the plate can be rewarmed, and with a warm palette knife remove the irregularities by a gentle pressure.

5861. Paste to Remove Grease Spots From Cloth.

(S. & J.) The following are taken from the Era Formulary:

Oleic acid..... 1 part.
 Borax..... 2 parts.
 Oxgall, fresh..... 5 parts.
 Tallow soap..... 20 parts.
 Triturate the borax with the oxgall, then thoroughly incorporate with it the soap, previously reduced to powder, and lastly incorporate the oleic acid.
 2.) Extract quillaya..... 1 ounce.
 Borax..... 1 ounce.
 Oxgall, fresh..... 4 ounces.
 Tallow soap..... 15 ounces.
 Triturate the borax with the extract of quillaya and afterwards with the oxgall, which will cause at least partial solution. Then thoroughly incorporate with it the soap so as to produce a plastic mass, which may be molded into sticks or put into boxes. If no extract of quillaya is at hand, soap bark in shreds may be exhausted with boiling water, and the liquid evaporated on a water bath. One hundred parts of bark yield about 20 parts of the extract.

In the authority quoted may be found a number of formulas of a similar nature.

5862. Face Bleach.

(J. A. M.) Many preparations of this nature contain corrosive sublimate, the indiscriminate use of which is questionable and should be discouraged. Some of these preparations are directed to be applied once or twice a day to the face, after first washing in hot water, and subsequently washing again a short time after the application has been made. Other preparations of a similar nature are sometimes applied to the face at night upon three or four thicknesses of linen, cut to fit, removing them when dry. A redness of the skin sometimes follows after a few applications, the epidermis then peeling off in fine scales. An ointment or cold cream should then be applied, the following having been very highly recommended for the purpose:

Spermaceti..... 7 grams.
 White wax..... 7 grams.
 Oil sweet almond..... 14 grams.
 White precipitate..... 14 grams.
 Salicylic acid..... 1 gram.
 Use night or morning, gently rubbed in with the finger.

The following solution has also been recommended as a face bleach and, as it contains no poisonous substances, seems to be a very desirable one.

Bismuth subnitrate... 4 to 6 drams.
 Glycerine..... 2 drams.
 Water..... 4 ounces.
 Perfume, a sufficiency.

5863. Syrup Iodide of Iron.

(A. F. M.) asks for further particulars regarding the preparation of syrup iodide of iron from the formula for a solution iodide of iron given in the December 1st Era, page 498: Iodine, 16.40 grams; iron filings, 8 grams; and distilled water, 20 grams, are heated together until the re-

action is complete, and the solution filtered whilst hot into a vessel containing pure glycerine, 220 grams. The filter is washed with a jet of boiling distilled water, and the mixed liquids are then warmed gently until the contents of the vessel weigh 240 grams. The solution is immediately poured into well-dried vials, containing when filled 18, 36 and 72 grams respectively; these are at once corked securely, and, when cool, the corks are well paraffined. When required for use the contents of the vials are mixed with sufficient syrup to make $\frac{1}{2}$, $\frac{1}{4}$ or 1 litre of syrup iodide of iron, according to size, and both the solution and syrup thus prepared are said to keep without change. The strength of syrup iodide of iron varies in the different pharmacopoeias, that of the French Codex being much weaker than the others; 1 part of iodine (1.2 part of ferrous iodide) is represented by about 12—(U. S.), 21.5 (Fr.), 24.4 (P. G.), and 24 (F. Codex), parts of syrup; or 1.00 parts of the syrup contain 83 (U. S.), 46.5 (Fr.), 41 (P. G.), and 41.0 (F. Codex) parts of iodine.

The solution of iodide of iron made by the above process contains about .068 grams iodine in each gram of syrup, equivalent to about .0816 grams of ferrous iodide in the same quantity, which makes it weaker than the U. S. P. syrup and, of course, the dilutions with syrup make it still weaker in iodine and ferrous iodide content.

5864. Polish for Patent Leather.

(R. O. M.) French Paste for Patent Leather.—To preserve the gloss of patent leather the following preparation is used: Melt pure wax over a water bath. Place it on a moderate coal fire, add first some olive oil and then some lard, and mix intimately by stirring. Then add some oil of turpentine, and finally some oil of lavender. The resulting paste is filled in boxes, where, on congealing, it will acquire the requisite consistency. Apply a little of it to the shoe or boot, and rub with a linen rag, which will restore the gloss to the leather and keep it soft and prevent cracking.

2.) Gum..... 8 ounces.
 Treacle..... 2 ounces.
 Ink..... 1 pint.
 Vinegar..... 1 ounce.
 Sweet oil..... 1 ounce.
 Alcohol..... 2 ounces.
 Lampblack..... $\frac{1}{4}$ ounce.

3.) Cracks in patent leather: Take $\frac{1}{2}$ pound molasses or sugar, 1 ounce gum arabic and 2 pounds ivory black; boil them well together, then let the vessel stand until quite cooled, after which bottle off. This is an excellent reviver and may be used as a blacking in the ordinary way, no brushes or polishing being required.

5865. Prescription Query.

(G. E.) asks if the following prescriptions can be compounded so as to make transparent mixtures. Would it be practicable to add glycerine to the first formula to clear the mixture, and should the last one be dispensed with a "shake" label upon the bottle:

1.) Fluid extract ipecac..... $\frac{1}{2}$ ounce.
 Fluid extract licorice... $\frac{1}{2}$ ounce.
 Paregoric..... $\frac{1}{2}$ ounce.
 Syrup enough to make 3 ounces.
 2.) Ammonium muriate..... 1 dram.
 Morphine acetate..... 1 grain.
 Syrup senega..... $\frac{1}{2}$ drams.
 Creosote..... 10 minims.

Fluid extract eucalyptus..... 3 fl. drams.
 Syrup wild cherry, enough to make..... 4 ounces.

Neither of these prescriptions can be dispensed as written to make transparent mixtures, owing to the different solvent properties of the menstrua employed. If the ingredients employed in the first prescription are made according to the Pharmacopoeia, there should be no necessity of adding glycerine to clear the mixture, which should be dispensed as written. In the second case, the turbidity of the mixture is caused by the insolubility of the resin of the fluid extract of eucalyptus in the solvents of the mixture. In dispensing this prescription, the salts should be first dissolved in the syrups, and the creosote dissolved in the fluid extract of eucalyptus, the two solutions then gradually mixed, shaking after each addition, and the mixture sent out under a "shake" label.

5866. Quinin's Ointment.

(P. D. S.) This is a proprietary preparation and its composition is unknown to us. Here are, however, several formulas for veterinary ointments taken from the Era Formulary, some one of which may prove satisfactory to you.

1.) Chalk..... 12 $\frac{1}{2}$ pounds.
 Soft soap..... 5 pounds.
 Water..... 5 quarts.
 Heat to the boiling point and add:
 Chlorinated lime..... 10 ounces.
 Water..... 2 $\frac{1}{2}$ ounces.
 Boil until pasty and add:
 Creolin..... 5 ounces.
 Friar's balsam..... 10 ounces.

The ointment may also be used, when mixed with water, for laundry purposes and as a garden insecticide.

2.) Resin ointment..... 5 ounces.
 Verdigris..... $\frac{1}{4}$ ounce.
 Turpentine..... 2 ounces.
 Mutton tallow..... 2 pounds.
 Oil of origanum..... $\frac{1}{2}$ ounce.
 Tincture of iodine..... $\frac{1}{2}$ ounce.

This is a good remedy for scratches, hoof-evils, cuts, etc.

3.) A very good stimulating liniment may be made as follows:

Castor oil..... 2 ounces.
 Rape oil..... 2 ounces.
 Turpentine..... 2 ounces.
 Shake them and then add:
 Strong solution of ammonia..... 3 ounces.
 Water..... 3 ounces.

5867. English Pain Cure.

(J. W. B.) We do not find it advisable to make a complete analysis of the preparation you sent. Here are, however, several formulas, some one of which may be of service to you:

1.) Oil sassafras..... 1 fl. ounce.
 Oil peppermint..... 1 fl. dram.
 Oil hemplock..... $\frac{1}{4}$ fl. ounce.
 Capsicum..... $\frac{1}{2}$ ounce.
 Camphor..... $\frac{1}{4}$ ounce.
 Hoffman's anodyne..... 2 ounces.
 Alcohol enough to make 1 pint.
 Macerate the mixed ingredients for a week or ten days, agitating frequently, and filter.

2.) Camphor..... $\frac{1}{4}$ ounce.
 Capsicum..... $\frac{1}{2}$ ounce.
 Oil turpentine..... $\frac{1}{2}$ fl. ounce.
 Oil sassafras..... $\frac{1}{2}$ fl. ounce.
 Ether..... $\frac{1}{2}$ fl. ounce.
 Alcohol, enough to make 1 pint.

3.) Oil sassafras.....	1 fl. ounce.
Oil cloves.....	¼ fl. ounce.
Oil turpentine.....	½ fl. ounce.
Ether.....	½ fl. ounce.
Capsicum.....	¼ ounce.

Alcohol enough to make 1 pint.
4.) Here is a formula for a pain cure taken from the New Idea:

Oil sassafras.....	10% fl. drams.
Aqua ammonia.....	5½ fl. drams.
Tincture capsicum.....	10% fl. drams.

Alcohol enough to make 1 pint.

Dose, one teaspoonful.

Formulas 2 and 3 are very close imitations of the sample supplied.

5868. Skin Food.

(A. F. M.) Many of these preparations are, in reality, cold creams or salves prepared with some suitable odor and colored as desired. Fat forms the basis of these mixtures, and gives them their hygienic effect, as it imparts fullness and softness to the skin. Try the following, the first of which quite closely resembles those on the market:

1.) Spermaceti.....	3 ounces.
White wax.....	3 ounces.
Nut oil.....	22 ounces.
Alcohol.....	1 ounce.
Water.....	4 ounces.
Chloroform.....	4 drops.
Oil rose geranium.....	30 drops.
Oil bergamot.....	6 drops.
Tincture alkanet, a sufficient quantity.	
2.) Oil sweet almond.....	8 fl. ounces.
White wax.....	1 ounce.
Spermaceti.....	1 ounce.
Rose water.....	5 ounces.
Borax, in fine powder.....	4 drams.

Melt the wax and spermaceti in the almond oil by the aid of heat, dissolve the borax in the rose water, and when the white wax, etc., is cooling, gradually add the solution of borax, beating or agitating with a wooden spatula until cold. This makes a cold cream base to which other ingredients may be added if desired. If other oils are required to perfume the mixture, mix them with the mass while agitating and nearly cool. If it is desired to add coloring, add it to the solution of borax in rose water. Tincture of benzoin added to the melted mass gives it an agreeable odor and helps materially to preserve it. This preparation may be colored by alkanet or carmine.

3.) Here is a formula in which lanolin is employed:

Soft paraffin.....	14 ounces.
Hard paraffin.....	1 ounce.
Lanolin.....	4 ounces.
Water.....	6 ounces.
Otto of rose.....	5 drops.
Vanillin.....	4 grains.
Alcohol.....	2 drams.

Melt the paraffins on a water bath, pour into a warm mortar, add the lanolin and with constant stirring, incorporate the water. When of the consistency of a thick cream, add the perfumes dissolved in the spirit. This preparation, like the preceding, may be tinted if desired.

5869. Lupulin.

(E. P. T.) The commercial value of lupulin, like every other commodity, depends upon the demand. In addition to its use in medicine, it is used in the fabrication of beer, though to what extent we are unable to learn, for when you ask its use, the brewer smiles and changes the subject. Lupulin is obtained by stripping off the bracts of hops, and shaking and

rubbing them; and then separating the powder by a sieve. The powder thus obtained ought to be washed by decantation in preparing it for the market, so as to remove from it the sand or earth with which it is always contaminated.

After washing, it should be dried and stored in well-closed bottles or containers. True lupulin thus prepared, appears as a bright yellow granular powder, having an agreeable odor of hops, and a bitter aromatic taste. It is gradually wetted by water, instantly in alcohol or ether, but not by potash or sulphuric acid. Ignited, it burns with a brilliant flame like lycopodium. When seen under the microscope, lupulin does not have the appearance of a powder, but is made up of little grains each having an oval or round form with an organized cellular body and a reticulated surface. In the fabrication of beer, hops not only give flavor and bitterness to it, but are beneficial, owing to their tannin, which acts directly as a clarifying agent by forming insoluble compounds with the albumenoids of the malt extract, and indirectly as a preservative, because these albumenoids, which the hop tannin in great part removes, are the most readily decomposable bodies existing in the wort, and, if left in solution, would render the beer liable to putrefactive fermentation.

The sample of lupulin which you send is of doubtful commercial value, as it is very dark colored and apparently contaminated with too much dirt and other foreign material. Lupulin is obtained on a commercial scale by placing a perforated floor or sieve near the floor of the kiln, and such portions of lupulin as are freed from the bracts by ordinary handling are preserved and treated in the manner above indicated, or sold in the state in which it is found in the receptacles at the bottom of the kilns. Pure lupulin ranges in value from \$3 to \$3.50 per pound, and dealers in brewers' supplies are the parties who handle it most extensively. If you can obtain lupulin in the manner indicated it might be well to submit samples to dealers, among whom we might mention P. Weidner, Gratiot and Rivard streets, Detroit, Mich.; P. Magnus & Son, Randolph street, Chicago, or Falk, Walmsler & Co., State street, of the same city.

5870. Colors for Confectionery.

(C. B. T.) asks about the toxicity of eosine and yellow aniline as used in coloring confectionery. Eosine, as usually prepared for the market, is obtained from the action of phthalic anhydride on phenol. When phthalic anhydride acts upon resorcin, in the presence of a dehydrating agent like sulphuric acid or stannic chloride, at a temperature of 120° C., there is formed a compound resorcinophthalin, best known as fluorescein. This fluorescein is the base for the manufacture of a series of permanent dyes which are obtained by substituting hydrogen by iodine, chlorine, bromine, etc., to a greater or less extent. By the action of bromine upon fluorescein, is formed tetrabrom-fluorescein, or eosine. The soluble eosine of commerce is the potassium salt of this compound. In a report upon dyes and coloring matters in food, some years ago in the *Pharm. Rund.*, Dr. Edemann gave expression to the following statements concerning the toxicity of aniline dyes, and eosine in particular. These colors produce pronounced poisonous effects only when they possess pro-

nounced acid properties. The acid properties become more pronounced the more bromine, chlorine and iodine and aniline they contain in place of hydrogen, and they are also dependent upon the nature of the substituting element. Fluorescein, when given internally, is absorbed by the blood and at once secreted in the urine. No change in temperature, nor any other symptoms, are developed. Eosine, however, when administered to rabbits, unites at once with the mucous lining of the stomach, the temperature is at first lowered, then, after the lapse of a few hours, it rises above the normal, while excretions by the bowels are suspended for several days. Normal temperature is not reached again until several days after the constipation has ceased. Repeated large doses, corresponding to about 6 grains for a grown person, produce death from inflammation of the stomach. The colors derived from anilines or from metallic sources employed in coloring confectionery, are open to suspicion and their use should be discouraged. Upon this subject the Candy Maker says: "For all purposes it is better for the candy maker to purchase his colors ready-made, as they cannot, on a small scale, be produced any cheaper than they can be bought of large makers. The colors should be vegetable, for it is no doubt true that mineral colors, merely from the fact of their being mineral, are harmful, though, in some cases not actually poisonous. Aniline colors, though very bright, should be carefully avoided. They are all dangerous, though their evil influences cannot be traced. The French government, which is careful of the health of its citizens and the reputation of its manufactured products, allows for the use of confectioners:

Blue—Prussian blue, ultramarine.

Red—Cochineal, carmine.

Yellow—Carmine lake, saffron, French berries, turmeric, fustic.

Green—A mixture of one of the yellows and one of the blues.

The ultramarine, we have no doubt, is hurtful, as it is an indigestible substance, lying inert in the stomach, but few French people indulge in prettily colored candies. These handsome goods are mainly intended for exportation. Of the vegetable colors in the market we believe those of the English makers to be quite innocent and brilliant enough for the candy maker's use. These colors can be purchased of most druggists and supply houses.

Formulas Wanted.

(C.G.) Magic Iron Tonic, a tonic beverage, nerve and brain food.

(W. H. B.) Landsfield, a face wash.

WINTER DRINKS.

5871. Beef Tea.	
New Eng. Dr.	
Cibil's extract of beef.....	8 ounces.
Water.....	8 ounces.
Fluid extract celery.....	1 ounce.
Use about a half ounce to a mug of hot water.	

5872. Beef Tea Extract.	
Extract beef.....	5 ounces.
Hot water.....	1 pint.
Tincture black pepper.....	1 ounce.
Mix beef in hot water, then add the tincture, use of this 2 drams or 2 teaspoonfuls to each cup, and fill with hot	

water. Salt to suit the taste. The tincture of black pepper is made as follows:

Whole black pepper,
crushed 3 ounces.
Alcohol 1 pint.

Strain and filter. The object of this method is to keep the tea clear of sediment.

5873. Beef and Celery.

Libbig's extract of beef, 8 ounces.
Hot water 1 pint.
Extract of celery 1 dram.
Caramel 1 dram.
Mix beef in hot water, add celery and color, use a shaker top in the bottle, as there is a sediment in the beef extract which necessitates shaking. In a six or seven ounce cup shake about 2 teaspoonfuls of the beef extract prepared as above, draw on this sufficient hot water, add salt to suit taste, stir with a spoon, shake a little white pepper on top.

5874. Flavoring Extract of Celery.

Celery seed 2 ounces.
Alcohol q. s.
Powder the celery seed in an iron mortar, and pack the mixture in a percolator prepared for percolation. Cover with alcohol (using about 20 fluid ounces), and when the percolate appears close the exit of the percolator and macerate for a period of twenty-four hours. Then percolate slowly until one pint of percolate is obtained. The strength may be increased or diminished to suit the taste of the operator, the quality desired governing in this direction.

5875. Chocolate.

Am. Dr.
Van Houten's soluble cocoa 3½ ounces.
Boiling water 2 pints.
Granulated sugar 40 ounces.
Extract vanilla 3 ounces.
Dissolve the cocoa in the boiling water, then add the sugar; when that is dissolved, strain and add the vanilla.

5876. Chocolate.

Confectioners' chocolate... ½ pound.
Hot water 2 quarts.
Condensed milk 1 can.
Granulated sugar 5 pounds.
Whites of two eggs.
Extract of vanilla 1 ounce.

Cut the chocolate finely into a porcelain-lined evaporating dish, and with the aid of heat and a pestle, reduce it to a smooth paste. Add the water (boiling hot), stirring constantly, then stir in the condensed milk and sugar. Allow to cool, skim off the cacao butter, particles of chocolate, etc., add the white of egg, previously beaten to a froth, and the vanilla, and strain through muslin.

5877. Chocolate.

New Eng. Dr.
Baker's fountain chocolate 1 pound.
Syrup 1 gallon.
Extract vanilla, enough.
Shave the chocolate into a gallon porcelain-lined evaporating dish and melt with a gentle heat, stirring with a thin-bladed spatula. When melted remove from the fire and add one ounce of cold water, mixing well. Add gradually one gallon of hot syrup and strain; flavor to suit. Use one ounce to a mug.

5878. Hot Egg Chocolate.

Break a fresh egg into a soda tumbler; add 1½ ounces chocolate syrup and 1

ounce cream; shake thoroughly, add hot soda slowly into the shaker, stirring meanwhile; strain carefully into mug, top off with whipped cream and serve.

5879. Hot Chocolate and Milk.

Chocolate syrup 1 ounce.
Hot milk 4 ounces.
Stir well, fill mug with hot soda and serve.

5880. Coffee.

Coffee, freshly ground
and roasted 8 ounces.
Sugar 24 ounces.
Best French brandy 1 ounce.
Boiling water 16 ounces.
Moisten the coffee with hot water and the brandy, pack firmly in a percolator, and pour on the boiling hot water, collect the first 16 ounces of the percolate and dissolve the sugar in the percolate.

5881. Coffee.

Mocha coffee (ground fine). 4 ounces.
Java coffee (ground fine). 4 ounces.
Granulated sugar 6 pounds.
Hot water q. s.
Percolate the coffee with hot water until the percolate measures 72 ounces. Dissolve the sugar in the percolate by agitation without heat and strain.

5882. Hot Egg Coffee.

Break a fresh egg into a soda tumbler; add 1 ounce coffee syrup; shake thoroughly, add hot milk slowly into the shaker, strain carefully into mug, top off with whipped cream and serve.

5883. Hot Clam Bouillon.

Clam juice 1 ounce.
Fill mug with hot soda, add pepper and salt, stir well and serve.

5884. Hot Clam Broth.

Clam juice 1½ ounces.
Hot milk 2 ounces.
Fill mug with hot soda, add a sprinkle of salt and white pepper, stir well and serve.

5885. Hot Clam Shnike.

Clam juice 2 ounces.
Hot milk 4 ounces.
Shake well, add pepper and salt, stir well and serve.

5886. Bouillon.

Extract beef 3 ounces.
Water 2 pints.
Corn starch 1½ ounces.
Salt 2 ounces.
Boil the cornstarch with the water until the starch is thoroughly cooked; then add the extract of beef dissolved in 8 ounces of hot water; add the salt, and when dissolved make the finished product measure 2½ pints. To draw this use about 1 ounce to a 6 ounce mug and flavor with a few drops of a flavoring essence composed of tincture of summer savory, 3 ounces, and tincture capsicum, 2 drams.

5887. Ginger.

Fluid extract of ginger... 2½ ounces.
Sugar 40 ounces.
Water to 2½ pints.
Take 10 ounces of the sugar and mix with the fluid extract of ginger; heat on the water bath until the alcohol is evaporated. Then mix with 20 ounces of water and shake till dissolved. Filter and add the balance of the water and the sugar. Dissolve by agitation.

5888. Hot Orange Phosphate.

Hot orange 1½ ounces.
Acid phosphates 3 dashes.
Fill mug with hot soda, stir well and serve.

5889. Thompson's Chloroform Lincture.

Chloroform 2 ounces.
Alcohol 2 ounces.
Ammonia water 2 ounces.
Spirit camphor 2 ounces.
Tincture of aconite 2 ounces.
Spirit nitrous ether, sufficient to make 16 ounces.

5890. Ewald's Antipyretic Mixture.

Salicylic acid 5.0 grams.
Sodium phosphate 13.0 grams.
Ammonia water 2.0 grams.
Distilled water 10.0 grams.
Glycerine 10.0 grams.

5891. Chronic Rheumatism.

Potassium iodide 2 drams.
Wine colchicum root 3 drams.
Fluid extract black cohosh ½ ounce.
Peppermint water enough to make 4 ounces.
Teaspoonful every 3 hours.

5892. Spiritus Antischladens.

Hager.
Morphine 0.5 grams.
Dissolve in:
Acetic acid 15 drops.
Alcohol 30 grams.
Then add:
Oil thyme 30.0 grams.
Chloroform 40.0 grams.
Cologne water 60.0 grams.
Use externally in neuralgia and rheumatism.

5893. Substitute for Garfield Tea.

Times and Register.
Senna leaves 25 parts.
Couch grass 25 parts.
Balmiony 1 part.

5894.

Dyspepsia.
Medical Record.
Tincture cascariella 2 drams.
Tincture cinnamon 2 drams.
Tincture gentian 2 drams.
Tincture colombo 2 drams.
Tincture rhubarb 2 drams.
Tincture nux vomica 1 dram.

5895. Syrup Partridge Berry Compound. (Mother's Cordia.)

Partridge-berry (herb)... 8 ounces.
Helonias 2 ounces.
Blue cohosh 2 ounces.
High cranberry bark... 2 ounces.
Water 6 pints.
Brandy 2 pints.
Sugar 16 ounces.

Macerate the herbs in the brandy for three days, express the tincture and reserve; place the herbs in the water and boil down to two and one-half pints. Strain, add the sugar, and when dissolved remove from the fire and after it has cooled add the reserved tincture.

SPONTANEOUS COMBUSTION OF

L'UPULIN. On a German steamer about to sail from Bremen a case of lupulin was discovered to be on fire, which was attributed to the fact that there was considerable moisture present, and this, in conjunction with the large quantity of material and length of storage, had generated heat through the slow oxidation of the oil until the ignition point was reached.

KINGS COUNTY BOARD OF PHARMACY.

1. W. M. DAVIS.
2. DONALD D. CAMERON.
3. E. H. BARTLEY.
4. W. M. HUTCHINSON.
5. L. T. PERKINS.

This board was organized in 1879, shortly after the passage of an act governing sales of drugs and poisons in Kings County, which includes, principally, the city of Brooklyn. The board consists of five members, two of whom are elected by the Kings County Pharmaceutical Society, two by the Kings County Medical Society, and the fifth by the other four members of the board, and he acts as the secretary. The length of service is three years, and three of the present members have served more than one term. The board meets for examinations the last Tuesday of each month at the Brooklyn College of Pharmacy. It aims to give a practical examination, and 91 per cent of the applicants are successful in passing. About 2,000 pharmacists have been registered and 800 assistant pharmacists. The board employs a qualified pharmacist to act as inspector, his duty being to discover violations of the law in the

employment of unlicensed clerks. The present membership of the board is:

1. W. M. Davis, president, has served five and a half years. He is a well known pharmacist of Brooklyn, conducting a prosperous business at Broadway and Halsey street. He has twice served as president of the Kings County Pharmaceutical Society, has been vice-president of the Brooklyn College of Pharmacy, and is at present one of the school trustees of Brooklyn.

2. Donald L. Cameron is a retail pharmacist at Reed avenue and Hancock street, and is now serving his second term on the board. He is an active member of the Kings County Pharmaceutical Society and the Brooklyn College of Pharmacy.

3. E. H. Bartley, M. D., is professor of chemistry at the Long Island Medical College, and occupies a similar chair and

acts as dean of the faculty in the Brooklyn College of Pharmacy. He was formerly president of the Brooklyn Board of Health. He is the author of several well known works on chemistry, is a thorough and experienced teacher and a liberal contributor to current professional literature. He enjoys a large and lucrative practice as a physician. He has served on the board of pharmacy about two and one-half years.

4. Wm. M. Hutchinson, M. D., has been a member of the board two and a half years. He is a practicing physician and is connected with the Long Island Medical College as instructor in chemistry.

5. L. T. Perkins, secretary, conducts a retail pharmacy, corner Greene avenue and Cumberland street, doing a large prescription business. He has served on the board about seven years, and one term as president of the Kings County Pharmaceutical Society.

NEWS COMMENT.

Commerford & Lipton have purchased the St. Clair drug store at MacMahon, W. Va.

Chas. E. Chagnon, Centerville, R. I., is the owner of a new store, the fixtures of which are now being put in by Chas. P. Whittle.

The drug store of J. W. McCoy, Wheeling, is closed. Mr. McCoy retires from the business.

The drug store of Hugh V. O'Donnell, Providence, R. I., is being fitted with new fixtures by Chas. P. Whittle.

Jas. A. Slattery will soon open a new store in Pawtucket, R. I. His fixtures will be of quartered sycamore and made from special design by Chas. P. Whittle.

The Atwood Cork Co. has been organized at Portland, Me., for the purpose of manufacturing corks and selling cork wood.

The drug house of Samuel S. Jones & Co., Wilkesbarre, Pa., has been closed by the sheriff. No statement of assets and liabilities has been made.

The California Botanical Medicine Co. is the name of a new corporation founded at Los Angeles, Cal., for the purpose of manufacturing medicines.

Sexauer Bros. have purchased the drug business of J. D. Van Law, Bellair, O. They were formerly engaged in the drug business at Sulphur Springs, O.

The Journal of the American Medical Association states that the first woman in the Republic to receive the degree of M. D. was Mrs. Elizabeth Blackwell.

Campbell & Sons, Fostoria, O., are successors to Campbell & Godfrey. B. B. Campbell, the junior member of the firm, is a graduate of the Illinois College of Pharmacy.

S. L. Brice, corner Jacob and 36th streets, Wheeling, W. Va., has disposed of his store to Harry C. Stewart. The store is being fitted with new fixtures of antique oak.

The factory of H. D. Thatcher Manufacturing Company, Potsdam, N. Y., suffered a loss of \$10,000 by fire December 5. The company manufactured butter coloring and certain druggists' sundries.

Fleishman & Co.'s department stores in Pittsburgh, Pa., were closed December 23, 1893, by the sheriff on executions aggregating \$100,000. They transacted a large cut rate patent medicine business.

Otto P. Kauffman has been appointed receiver for the Western Chemical Co., a corporation organized under the laws of New Jersey, and doing business in Cincinnati, O., for the manufacture of wood alcohol.

J. F. Marquardt & Son, Tiffin, O., are out with a very nicely worded address to their friends and customers, in which no commas, periods or other punctuation are to be found. This they do to show that there is no stop to the hard times with them.

A Vice-Suppressing Society has been organized in San Francisco, and it is making a determined effort to root out many evils. Druggists selling morphine and cocaine indiscriminately are among those against whom the efforts of the society are directed.

Chas. R. Goetze, Wheeling, Va., has sold his store at 117 Sixteenth street to W. H. Hague, and purchased the pharmacy of McLane Bros., corner Market and Twelfth streets. This store is one of the most modern in Wheeling. Mr. Hill,

who succeeds Mr. Goetze at the former place, has for a number of years been employed in the pharmacy of A. T. Young.

W. P. De Vries, Jr., secretary of the West Virginia Board of Pharmacy, is busy preparing the questions for the spring meeting of the board. He is also connected with the Wheeling Drug Co., which recently succeeded J. N. Smith & Co., wholesale druggists.

An Omaha doctor was recently fined \$10 for being absent from the court room when subpoenaed as a witness. The doctor pleaded in extenuation that he had been called to attend a patient who was very ill, and stated that under the same circumstances in the future he would pursue a similar course. The judge then raised the fine to \$25.

The Palace Pharmacy, one of the finest in the west, is the name of T. F. Blackmore's new store at Eddy, New Mexico. The fixtures are finished in Chinese glass enamel with gold trimmings. The Dawes Manufacturing Co. furnished the Paris Square recess shelware, the Meyer Bros. Drug Co. the stock, and the Dallas Show Case Co. the show cases. Mr. Blackmore will carry a full line of drugs and surgical supplies and transact a wholesale and retail business.

An International Congress of Industrial Chemists will be held in Brussels, August 4, 1894, under the patronage of the Belgian Government. The programme is divided into four sections; chemistry as applied to sugars, agriculture, foods and hygiene, and biology. The president of the committee on organization is Prof. E. Hanulise, Brussels, and the secretaries, F. Sachs, general secretary of the Belgian Association of Chemists, and Prof. H. Van Laer, of the Industrial School of Mines, Brussels.

Not long since, Lea & Perrin, the Worcestershire sauce concern, caused injunction proceedings to be issued against the Western Distilling Co., of St. Louis, for infringing upon its rights and counterfeiting its labels. John L. Venny, a grocer of St. Louis, after reading an account of these proceedings in the papers, thought it would be a good idea to counterfeite the cans and labels of a certain well-known baking powder. The scheme was, however, nipped in the bud, for when arrested Venny had just received his first consignment of labels, none of which he had been able to use.

The address of the president of the American Medical Association at its last meeting was received with particular favor. One pertinent portion of it was that relating to the manufacture and sale of secret and poisonous medicines. He believes the association owes to the people of this country that a strong effort be made to stop the sale of these goods. He instanced the fact that free trade in poisons is permitted only in this country, and that it is the only one in which are advertised in journals of all characters patent medicines of as varied characters. He believes that the sale of pharmaceutical preparations should be confined to the pharmaceutical fraternity, as it is all over Continental Europe, and that rigid laws and heavy penalties for violations of the laws should be enforced. Another suggestion was that each State should require the vendor of any secret remedy to submit his formula to a properly appointed board which should refuse or permit license to sell.

INTER-STATE RETAIL DRUGGISTS LEAGUE.

Boston, Mass., Dec. 26, 1893.

At the request of the New York City and other branches, a special convention of the Inter-State Retail Druggists' League, will be held on Tuesday, February 6, 1894, at Ionic Room, Terrace Garden, 147 East Fifty-eighth street, New York City, at 10 o'clock a. m., to devise measures for the advancement of the league and the cause for which it was instituted.

It is earnestly hoped that local organizations throughout the country which have not yet joined the league, will do so at once, so that the united wisdom assembled may tend to ameliorate existing conditions of trade among the retail fraternity. It costs but one dollar per year for each individual enrolled, and the possible and even probable results of such a pooling of interests may bring returns an hundred fold. Lack of complete organization has been the one cause of failure in past movements. With such organization we can accomplish all we desire—without it, absolutely nothing.

Hitherto it has been a difficult problem to solve the question of controlling the large army of retailers within one organization. The Inter-State League, being an aggregation of local associations or branches, sending delegates (one to a hundred) to a central or national body, seems to solve the difficulty and secure as perfect representation as though the local associations were assembled in full. Each delegation receives its instructions from its home association. Each local organization can, to a certain extent, take care of its own market, but the national feature is essential, so that one section may not pull down what another section has built up.

The "Detroit" plan adopted at the recent meeting of the N. W. D. A., had previously been recommended to manufacturers by the League, and it is the most easily carried out plan up to date. If followed out faithfully by all parties concerned, it must inevitably result advantageously to all. It is not necessary here to explain the plan in detail, as it has already been published in all the pharmaceutical journals. Suffice it here to say that the Detroit convention was noted as being the most harmonious ever held by the N. W. D. A., and the retailers present emphatically helped to make it so. The plan there adopted, to be a success, must have the active support of jobbers and retailers. The antagonism of either means failure.

I would advise that the retailers confer with their jobbers in friendly convention, each for the good of the other. The former can help the latter in organizing by instructing their traveling men to solicit petitions from the retail customers to the manufacturers, asking them to adopt their retail feature of the plan. These same commercial men can greatly aid us in forming local branches of the League. They make splendid canvassers, besides working in, the employers' interests by so doing. The "drummer" is commonly looked upon as a sound and level-headed adviser. The manufacturers, whose products are worth handling, are ready when the retailers say so. Judging from what has already been done in some sections, we can deluge them with petitions.

My dear retail friends, if it is worth while at all to regain some of our lost prestige in certain lines of goods, then it is worth some slight effort on your part. Come out of your shells! Put your shoulders to the wheel! If the measures suggested by earnest men who have given liberally of time, labor and money for years in your behalf are not to your liking, then by your united wisdom show them a better way. At all events sink individuality for the common good.

It is a good sign to note, where petitions are being extensively circulated in localities for the Detroit plan, that the daily papers, at the instigation of their best friends, the advertising cutters, have already begun to expose this imposition (?) on the "dear public." The advertising cutter is a keen business man. No one knows better than he what can be done by the united effort on the part of the legitimate trade. He feels that "there is something in the wind." He must "nlp it in the bud" by a liberal dose of "bluff." I often wonder if the aforesaid "dear public" ever stops to think how enormously it must pay for goods not on the advertised (full page) list, for certainly these sold-at-cost, draw-you-in "bait" cannot support the immense establishments.

Pay no attention to these assaults. Remember that "to the victor belong the spoils." Know your own strength, and knowing it, unite in any legitimate measure that promises success. Organize locally, and then—join the League.

Mr. Robert J. Frick, corner Sixth and Chestnut streets, Louisville, Ky., secretary of the League, will be glad to answer any questions you may be pleased to ask pertaining to his office, and it will make the treasurer, Mr. Frank H. Carter, Indianapolis, Ind., happy to receive your contributions. To those seeking information as to hotel accommodations or other matters relating to the meeting, our state executive, Mr. V. Kostka, 700 Ninth avenue, New York City, will be pleased to assist you, while the undersigned is ever at your service.

Respectfully yours,

HENRY CANNING,
President.

A statue to Chevreul, the great French chemist, has been inaugurated with ceremony at Angers.

Frank Tucker, of Roxbury, Mass., has put in some handsome new fixtures of quartered sycamore in colonial design and made by Whittle.

The Greenpoint Chemical Works has been incorporated at Brooklyn, and will manufacture iron mass for gas purification, and Prussian blue.

Geo. F. Tower, of the Goodwin Manufacturing Company, St. Louis, manufacturers of glycerine, etc., is dead. The business will be conducted as heretofore under the same firm name.

The recent death of Cooper Smith, of Cooper Smith & Co., manufacturers of chemicals, Philadelphia, Pa., does not affect the business arrangements of the firm, which will be conducted under the same name as heretofore.

A well, furnishing a pressure of 25 pounds dry carbonic acid, is a new industry at Saratoga Springs, N. Y. The Wilcox-Harvey Natural Carbonic Acid Company intend to compress this gas into liquid form and sell to the trade.

NEW YORK.

New York, December 23.—The approach of the new year has been anxiously awaited. A general improvement in business has already manifested itself, and the signs of the times point to greater activity than we have enjoyed in the past year. Most of the stores making a specialty of holiday goods fared unusually well, the depleted condition of their stocks bearing evidence to the heavy drain made upon them. An unusual amount of time and care seems to have been given to window displays, and some artistic results were obtained, which, no doubt, had considerable to do with the trade attracted. The continuance of the grip is also helping to increase business, especially in the prescription departments.

One of the saddest events of the year was the sudden and horrible death of Louis F. Hiltz, a retail pharmacist of Brooklyn. He was killed by a trolley car near the corner of Ralph avenue and Fulton street. Hiltz tried to jump on the front platform. One of his feet slipped, and before the motor man could put on the brakes, the man was pulled under the front wheels and crushed to death. As soon as the car could be stopped, the body was removed, it being literally cut to pieces. His death was a severe shock to his wife, who had just commenced to recover from a long run of sickness. The remains were interred at his former home, Norwalk, O. His store was located at Hopkins avenue, corner Herkimer street, where he had succeeded in building up a paying business. He was a graduate of the New York College of Pharmacy, '90, and valedictorian of his class. He was well known for his genial and affable manner, and had a host of friends, to whom his death was a great shock.

H. Fisher & Son have bought the store of James E. Wier at Bridgeport, Conn.

A. G. Hiller, 540 Tenth avenue, has sold out to M. Lehman, 35th street and Tenth avenue.

The store of James H. Jones, of Fordham, was slightly damaged by fire recently.

Mr. Pollock has bought the drug store located at Second avenue and Thirteenth street.

Chas. H. White, 511 Madison avenue, reports trade in his locality greatly improved.

O. F. Fuller, of the Fuller & Fuller Co., Chicago, has been paying a brief visit to this city.

Mr. Murray, of the Murray & Nickells Manufacturing Co., Chicago, was in town last week.

J. H. Feemster, manager of the glycerine department of Procter & Gamble, was in town recently.

Frank Gundlach, N. Y. C. P., '81, was married to Caroline Augusta Badeau, October 24th, 1893.

J. F. Brookfield and R. C. McCall, southern representatives of McKesson & Robbins, are in town.

J. F. Hartman has bought the store of L. Steinweldel, De Kalb avenue, near Stuyvesant, Brooklyn.

C. N. Crittenton, the founder of the C. N. Crittenton Co., has returned from an extended trip in Europe.

Adolph Ammon, class 1887, New York College of Pharmacy, was married November 22 to Miss M. Louise Fiegl.

The store of Hunter & Co., Tremont, has been sold to the former manager, and is now known as Crowell's pharmacy.

K. H. Westphal, formerly with M. H. Smith, 76th street and Lexington avenue, is enjoying a three months' vacation in Europe.

Richard D. Young has been appointed general manager of the New York branch of the Crown Perfumery Co., of London, England.

F. L. Feind, 115 Broome street, Newark, N. J., has sold his store to his son, John Feind, who has been managing it for some time.

Hazzard, Hazzard & Company have moved from their store on Fifth avenue to Broadway and 27th street, under the Victoria Hotel.

George Hecht, head clerk of Englehardt & Huber, Third avenue and Thirteenth street, is meeting with good success in the sale of his corn cure.

C. H. Duffy, N. Y. C. P., '79, has opened a new store at 1973 Second avenue. Mr. Duffy also received the degree of M. D. at the university last spring.

Otto Edler, formerly manager of the East New York Drug Company, Brooklyn, is now with Hardenberg & Angus, Columbus avenue and 75th street.

L. E. Findt, South Orange, N. J., is feeling jubilant over the completion of his new building, opposite his present location, which he will soon occupy.

Hugo Beckhs, formerly of Flushing and Bushwick avenue, Brooklyn, has bought the store of Richard Lucke, 81st street and Amsterdam avenue, New York.

C. F. Dyna, lately with J. Williams, corner Atlantic and New Jersey avenue, is now with John Sidley, Columbus avenue and 94th street, New York City.

W. J. Robinson, a graduate of the New York College of Pharmacy, has also graduated in medicine, and established himself in building up a lucrative practice.

Leonard J. Pastor, the young man recently arrested in Boston at the instigation of the Massachusetts Board of Pharmacy, was formerly a resident of Brooklyn.

Tomas & Co., former owners of the store at 94th street and Columbus avenue, now owned by John Sidley, will open a store at Fifth street and Columbus avenue.

J. L. Hopkins, of J. L. Hopkins & Co., has just returned from an extended western trip, and in spite of the dullness of the market has succeeded in doing a large business.

The owners of Paul Balluff's pharmacy will open a branch store at Columbus avenue and 84th street. It will be managed by Ernest F. Sickenberger, class 1882, N. Y. C. P.

Mr. Hammerschlag has sold his store, corner North Second street and Broadway, Brooklyn, and bought the store of Hugo Beckhs, corner Bushwick and Flushing avenues.

Henry Schimpf, professor of chemistry in the Brooklyn College of Pharmacy, having sold his drug store in New York City, has purchased a residence in Brooklyn near the college.

John Williams, formerly located on Ninth avenue, between 29th and 30th sts., New York City, has purchased the drug store corner of Atlantic and New Jersey avenues, Brooklyn, which Chas. F. Hanson had recently purchased for the East New York Drug Co.

Ed. F. Mallory, who for some time has represented Solon Palmer in the northwest, will, after January 1st, be the representative of Lazell, Dalley & Co., in Chicago.

J. K. Brater, proprietor of Brater's Asthma Cure, and formerly head clerk with C. F. Ford, 36th street and Seventh avenue, is now with Daggett & Hamdell, the Fifth avenue pharmacists.

Curt W. Knappe, '91 N. Y. C. P., and located at Carlsbad, N. J., has purchased another store at Iutherford, N. J., formerly owned by F. W. McGee & Co. Mr. Knappe will conduct both pharmacies.

A. J. Ituder, N. Y. C. P., '90, and Gilbert F. Ituder, '87, have purchased the store of Theodore Angelo, Fourth avenue and 31st street, and will conduct the same under the firm name of Ituder Bros.

Wm. M. Davis, Broadway and Halsey street, Brooklyn, president of the Kings County Board of Pharmacy, has entirely recovered from his recent illness and is attending to his numerous duties as usual.

Norbert Franck has been managing the retail department of E. Fougere & Co. during the illness of Leon Millie. Mr. Millie has completely recovered his health, and will soon be able to resume his old position.

The regular monthly meeting of the Kings County Pharmaceutical Society was held at the Brooklyn College of Pharmacy building, and some very interesting papers were read by Dr. E. H. Bartley and others.

W. C. Anderson, formerly professor of pharmacy at the Brooklyn College of Pharmacy, and now in the retail drug business at Binghamton, N. Y., paid a brief visit to Brooklyn and was royally welcomed by his many friends.

James Shillinglaw, N. Y. C. P., '87, and Henry McNulty, '91, have purchased one of the leading stores in Malone, New York, their former place of residence. Both were with P. B. Knappe & Sons, 362 Hudson street, New York City, for a number of years.

The store of H. M. Boardman, Fulton street, Brooklyn, has been entirely redecorated in bird's eye maple. The effect is novel as well as pleasing to the eye, and Manager N. Patterson is kept busy explaining that the knot holes which appear on the walls are the work of the grainers and the building is in no danger.

H. A. Bracklein, graduate N. Y. C. P., '90, and head clerk for M. Bretlenbach, Madison avenue and 57th street, has been visiting his old home in Kansas City, Mo. While there he was married to Miss Alma Hegg; he will be kept busy acknowledging congratulations from his many friends and classmates when he returns.

William H. Camp, a grandson of the late John McKesson, was instantly killed at the Morris Heights station of the New York Central R. R. He had alighted at the station and walked upon the south bound track just as an express train went thundering by. The engine struck him, crushing his skull, breaking his leg and killing him instantly. He was a student at Columbia College.

The meeting of the Alumni Association of the New York College of Pharmacy was held on Wednesday evening, December 13, at the college building. The report of the committee on final arrangements for the publication of the Alumni Journal was read and accepted. The editorial staff is as follows: Editor, A. G.

Harrison, M. D.; assistant editors, Frederick Hohenthal, Ph. G. and Henry Heller, Ph. G.; business managers, A. Henning and F. H. Caswell. The secretary was ordered to take action on the death of L. Hiltz, of Brooklyn.

The troubles in Brazil and the fitting out of the embryo Brazilian fleet here has not been without its benefits to the drug trade. Messrs. McKesson & Robbins received the contracts for fitting out the vessels with a complete floating drug store. Probably no regular man-of-war has so complete a stock as the Nichteroy and Republica. Messrs. Fraser & Co. have recently fitted out Vanderbilt's new yacht with a stock that contains a cure for every ill that human flesh is heir to. Medicines in tablet form are certainly a great boon to those aboard ship, as they are enabled to carry in a comparatively small space and with perfect safety a complete stock of the ordinary remedies.

The New York Society of Apothecaries on November 30th, Thanksgiving night, held its second annual complimentary reception at Fifth Avenue Hall. President Thos. E. Fraser presided with marked success. In a few well chosen words he welcomed all, and talking in a humorous vein said this was one of the first times a druggist gave everything away, and he presumed that, in consequence, the prices of drugs would be raised next day. Everything was free, plenty to eat and drink, and music and dancing. The committee of arrangements consisted of H. B. Myer, J. C. Bryant, J. A. Rosenheim. While the dancing was going on in the lower hall, a reception was held upstairs. Among the guests were T. Loud, of Merck & Co., Otway Latham and M. R. Mandelbaum, of Tilden & Co.

The police department is taking a census of the doctors practicing in New York City. This is at the request of the State Medical Society, as information has been received by that body that a large number of doctors who have no diplomas are practicing medicine here. In order to get a complete list, it was thought necessary to enlist the aid of the police department and they were instructed to copy the names and addresses from all the doctors' signs they came across. The work was completed in about two hours, and the list has been submitted to the State Medical Society, which will take steps to prosecute those who have been practicing illegally. It is estimated that there are between 3,500 and 4,000 physicians in the city.

L. Barker, a clerk formerly employed at Bongartz's Pharmacy, Ninth avenue and 55th street, was recently arrested for stealing from his employers. It seems he had been systematically robbing the store when employed there. He had slept in the store previous to his discharge and, after he left their employ, the loss of goods continued. A trap was laid for him, the night clerk remaining in the store secreted behind the counter, and when he unlocked the door and entered, and proceeded to help himself, he was caught by the clerk, but escaped down the back stairs. Being perfectly familiar with the place, he went through the celars of the block and succeeded in getting away, but was caught the next day at his own house. His confederate was also captured. His trial was to take place on Friday, December 8th, but the detective who arrested him was too ill to be present, so it was postponed.

BOSTON.

Boston, December 26.—Thanks to the vigilance of the State Board of Pharmacy, two important arrests have been made in this city. The prisoners are Eugene Levitan and Leonard J. Pastor. The charge against the men is forgery, but the crime of which they are guilty, by their own confession, is much worse. The men are Russians and have been in this country but a few years. Until the other day both were legally registered pharmacists in this city; but one of the men, Levitan, it is said, knows but little more about putting up prescriptions than a child. It appears that the certificate issued by the board in June last, and until recently in the possession of Levitan, was secured by means of a forgery. About last April Pastor came to this city from New York, and made the acquaintance of Levitan. As Pastor was badly off financially, and as Levitan was anxious to become a registered pharmacist, Pastor, who is an excellent mixer of drugs, offered to get a certificate for Levitan for the sum of fifty dollars. This was satisfactory, and on the 6th of last May Pastor filed an application to become a registered pharmacist and signed the name of Levitan to it. On June 1 he was ordered to appear before the board to be examined. When he was asked to sign his name to the papers he signed that of Levitan. During the examination Pastor showed himself extremely proficient in his knowledge of medicine, and passed a first-class examination. As a result the supposed Levitan was issued a certificate, which was forwarded to the real bearer of that name, who was then employed as a boy in the drug store of Mr. Kromberger, 100 Salem street. After getting his certificate he went to work as a registered pharmacist for a druggist at 29 Leverett street. He stayed there until a few days ago, when he purchased a store with another man at 83 Leverett street. Everything went smoothly until a few days ago, when the Board of Pharmacy received an anonymous letter saying that Eugene Levitan knew nothing at all about the business, and suggesting that the board must have been deceived in some way. An investigation disclosed that there was something wrong and a detective was called into the case. The latter found evidence that the certificate had been secured by Pastor, and then President Whitney remembered an incident which took place in last September. In that month a man who gave the name of Leonard J. Pastor, his right one, called at the office to be examined. At that time he did not have a mustache, but despite that fact the board thought that it had seen him before. He passed a good examination, and this time was granted a certificate in his own name. Having this in mind, it was thought to be advisable, the other day, to request Levitan to call at the office of the Pharmacy Board, and there he was totally unable to answer the questions which at one time it was thought he had passed. He was also unable to write his name the same as it was on the application blank of last May, and the detective then told him that there was reason to believe that he was an accessory to a forgery. Levitan admitted that he was, and told all. Pastor was also arrested, and admitted that he had secured the first certificate by means of forgery and misrepresentation. He

broke down shortly after his arrest and said that he was driven to do as he did, because he was unable to secure work. It appears that soon after he secured his own certificate Pastor joined hands with William E. Morgan, and the two started the Pharmaceutical Preparatory School at 157 Washington street, in room 4. It is said that the school has not been a success as yet, as but one of the pupils has applied for a certificate of the board, and failed to pass examination. Pastor is 24 years of age, and claims to have been in Boston since last April, when he came from Brooklyn, N. Y.

In the case of Robert H. Kimball vs. Harlow E. Woodward, the druggist, which was an action of tort to recover \$5,000, a verdict of \$913 was awarded. Mr. Kimball alleged that on May 5, 1890, he leased from George Johnson & Co. a part of the premises No. 100 Tremont street for two years and eleven months, for \$1,000 a year, and that in November, 1891, the lessors assigned their interest in the store to defendant, who, in February, 1892, evicted plaintiff, to the latter's great damage. This is the case where Mr. Woodward so placed a counter that it was practically impossible for anybody to deal at the counter where Mr. Kimball kept his goods, and finally the latter became tired of the battle and withdrew from the store.

James W. Tufts is building on Tufts street, near Chelsea and Bunker Hill streets, Charlestown, a model tenement house, patterned after the Peabody model dwellings in London. Special attention is to be paid to the sanitary arrangements; families will be supplied with food from a restaurant; there will be a club room for men, and a room where cooking and dressmaking will be taught to women; a day nursery for the use of tenants, bath rooms, baths and a laundry. Rents are to be low, the highest charge for a room to be but \$1.50 a week.

Since the mysterious death in a South Boston family, there have occurred in this city two cases of suicide wherein the same poison, cyanide of potassium, was employed; and yet the statute requires that whoever sells poisons, the cyanide of potassium being specifically named, without the written prescription of a physician, shall keep a record of such sale, with the name and residence of the person to whom it is delivered. This record is open to the inspection of the police authorities. The law imposes a penalty of not exceeding \$50 upon the purchaser who gives a false or fictitious name, but fear of this fine can have little weight with the person bent on suicide, and the record of sale which is open to police inspection, although it may assist in the detection of a murderer, is but a locking of the stable door after the horse is stolen, so far as suicides are concerned. It has been suggested that there should be adopted an amendment of the statute requiring proper identification of persons asking for poisonous drugs and preparations, with satisfactory reasons for purchasing. One thing is certain: It is practically impossible to buy the drug in any South Boston pharmacy.

A discharge in bankruptcy has been granted to the Balsam Fir Co.

Arthur Bowker, of Brookline, is going to move into a new drug store.

A new pharmacy has just been opened in Bath, Me., by J. E. Foster.

J. A. Slattery, of Milford, has gone to Pawtucket, R. I., to open a drug store.

G. E. Bonney & Co. have taken the drug store of Smith, who failed, in New Britain, Conn.

David F. Baxter, the Brookline druggist, has just bought of J. W. Tufts some apparatus for hot soda.

C. Arthur Peck, of Malden, and J. Fred Hood, of Turner's Falls, have filed a voluntary petition in insolvency.

A decision has just been given in favor of the Russia Cement Co. in a suit against the Le Page Co. for illegal use of a trademark.

Charles Knowles has been appointed assignee in the case of Harry G. Travis, druggist, 275 Hanover street, who has gone into insolvency.

A loss of more than \$3,000 was caused on the night of the 20th by a fire in the wholesale drug store of John W. Perkins & Co., Portland, Me.

In a list of subscribers to a fund for the unemployed of Boston there appears the name of John F. Low, of the Low Co., who has contributed \$50.

George H. Beckley, proprietor of the drug store in Putnam, Conn., formerly controlled by F. A. Libbey, has assigned to Judge Chesebrough, of Putnam.

The Maine Board of Pharmacy, which was to meet last week in Portland, did not come together, but will hold a session on the second Wednesday in February.

Gilman Bros., the druggists, are to have for neighbors the publishers and editors of the Traveler, who have for many years been located on State street.

E. I. Sawyer has just opened a prettily arranged drug store at 325 Washington street (Egleston Square), this city. It contains a fountain supplied by the Low Company.

General Appraiser Wilbur F. Lunt, of New York, has lately been at the Boston Custom House to settle some perplexing questions concerning the classification of drugs.

Bagley, the St. Johnsbury druggist, is proudly wearing an overcoat which he has had for a quarter of a century. It is still in good condition, the color being as fine as at the start.

A plumbago vein has been opened in the town of Hawley, on the land of Newell Dyer. A. C. Galbraith, a laborer, discovered the mineral. He secured the right to lease the land and work the mine.

The Boston Druggists' Association met and dined at Young's on the evening of the 19th. Frank A. Davidson presided, and Fred L. Carter, T. I. Delain, Jr., C. B. R. Hazeltine and G. W. Cheney were the special guests. After dinner Prof. J. A. Mortyney, humorist and mimic, furnished merriment for the gathering.

Dr. Lowe, a manufacturing druggist, who came east from California about three years ago to assist in managing the Arena magazine, has sold out his interest in the Traveler. He had bought stock in the magazine while on the Pacific coast, and came east to push his venture. He has done so to the financial advantage of the radical monthly. He sold his Traveler stock to one of his associates in the Arena office.

George T. Sears was injured in a peculiar way the other morning, in his drug store, corner of Hanover and Blackstone streets. The lid of the soda fountain fell

upon his left hand and several arteries were cut, the wound being so painful that he fainted. He was removed to the Emergency Hospital, had the hand dressed, and after a few hours was able to go home.

Alvin D. Puffer, the soda water apparatus manufacturer, the purchaser of Samuel M. Shapleigh's new brick and stone house, No. 94 Beacon street, near Audobon Circle, has bought the estate for his own occupancy and will move into his new home as soon as the interior decorators have finished their work. The price paid for the property is not made public, but it is understood that Mr. Shapleigh held the estate at \$35,000.

Woodward, the Horticultural Hall druggist, has had in his store what he calls a "Christmas scramble bag." There was everything in it from a pocket knife to a dictionary or a silver watch, and all one had to do was to buy a dollar's worth of holiday goods, when the privilege became his of thrusting a hand and arm into the bag and drawing therefrom a present. This came pretty near being a lottery, but the police appear to have known nothing about it.

One of the show windows of the Standard drug store, St. Johnsbury street, has lately presented a beautiful combination of colors. The background and draperies were a deep violet shade. The central figure was that of a flaxen-haired child dressed in material of the same color. All around and about this figure were fancy articles, perfumes, toilet waters, etc., in colors that harmonized with the violet draperies. The whole effect was very pleasing and the display attracted a great deal of attention.

Many of the hundreds of employees of James W. Tufts have voluntarily begun to contribute weekly sums ranging from five cents to twenty-five, to be put into a fund for the good of the unemployed. It is expected that this will enable a committee to support five families throughout the winter. The whole plan is simple, practical and highly commendable. But charity is not unexpected in such an establishment, where the men are treated so kindly. The firm is just now permitting its employees to buy for Christmas gifts silver-plated ware at enormous discounts. This is an annual privilege, of which the employees very generally avail themselves. They are allowed to bring their wives or other members of their families in to make selections, and the sales are said to be great.

Amos K. Tilden, the School street druggist, who was a Democratic candidate for the Common Council from ward 10 at the recent city election, is well known not only to the citizens of the ward, but of the entire city. He has been a member of the Democratic state central committee for many years, and a member of the ward 10 committee every year except three since 1875. He was one of the originators of the Young Men's Democratic Club in 1868, during the Seymour-Blair campaign. Mr. Tilden has nominated Hon. Hugh O'Brien for Mayor, seconded the nomination of Governor Russell at Worcester, has placed Sheriff O'Brien in nomination for years, nominated Hon. James Donovan for the Governor's Council, and seconded the nomination of the Hon. Patrick Maguire when he was placed in nomination for the same office.

PHILADELPHIA.

Philadelphia, Pa., December 23.—The retail druggists are doing a better prescription trade, owing to the prevalence of the grip, which has got a strong foothold here. While the disease itself is not necessarily fatal, it is responsible for a large number of deaths. Of the total deaths for the week of December 19, fourteen were from the grip, sixty-nine from inflammation of the lungs, and thirty-six from heart disease, believed to have been the result of the grip. The contagious diseases from which death resulted were diphtheria, twelve, scarlet fever, six and typhoid fever, ten.

The story published in the Era of the whisky trust and the means it employed to break contracts was commended by the leading druggists in this city. It is generally known that a number of them were tripped up, but they do not want their names known. A prominent wholesale druggist has, however, been made to suffer. He thought his six months were up, and when the whisky broker offered alcohol below the trust prices he ordered a lot. Previous to this he had forwarded his vouchers for rebates to the whisky trust, but, after waiting a month for his money, he was notified that he had broken the contract, as he had one more month to go before having his rebates forwarded. The article in the Era, however, has opened the eyes of the retail druggists, and the broker's offers are now being refused.

The Distillers' and Cattle Feeding Company has awakened to the fact that it has a big job on hand to fight the wholesale druggists. It has found that intimidation had no effect, and now it is going around with a bottle of soothing syrup administering homeopathic doses to its patrons. The prescription offered is in the shape of a circular presenting the advantages of patrons becoming stockholders.

A prominent druggist referred to the meagre numbers that are daily at the drug exchange and attributed it to the telephone. Years before this instrument was in use it was necessary for a drug man to go to the exchange during exchange hours to transact his business. Here all contracts were made and signed, and there were always representatives of the drug houses on hand. Now it is different. Ten members is a large number and often five is considered quite a gathering. The cause of this is the telephone, the druggist not leaving his store to order goods.

The manufacturers of perfumes are up in arms against the portion of the Wilson bill which affects their business. On Wednesday, December 20, a meeting of the manufacturers of perfumery was held in the office of Messrs. Colgate & Co., 55 John street, New York, at which representatives from all sections of the eastern states were present. Philadelphia was there and entered a protest to the change in the tariff.

The trade is interested in the proposed tax on proprietary medicines and has given careful attention to the letter from George A. Kelly, chairman of the committee on legislation of the N. W. D. A., regarding the matter. (See letter on another page.—Ed.) Prior to receiving this letter the matter had been brought to the attention of the committee on legislation of the Philadelphia

Drug Exchange. President Lapp took hold of the matter as soon as he heard of it, and he suggested a consultation; a number of the members of the Drug Exchange were gotten together and debated whether it would be advisable for the exchange as a body to protest against the bill. But there are only a few members who are manufacturers of proprietary goods, and, after a long discussion, it was deemed advisable to have nothing to do with the subject, as the matter was to be taken in hand by the N. W. D. A.

The druggists of this city are lying awake at night trying to devise plans to defeat any hostile legislation that may be brought up at Washington. There is considerable lobbying being done to keep the duty on quinine, but it is generally thought nothing will be accomplished, as an audience with the committee is very hard to obtain. A few days ago a committee, representing the manufacturers of powdered drugs, went to Washington to protest against the admission of powdered drugs free of duty. The committee, as a body, could not be seen, and only one or two of the members of the committee deigned to give the visitors a hearing. It was with great difficulty that any information could be secured. There is a representative of the drug business in Washington who is on the lookout for any measure that may prove detrimental to the interests of the trade, but it is almost impossible to get printed copies of the bills.

During the last week there has been quite a revival in the wholesale drug trade. Some of the principal houses are as busy as they were last year. Smith, Kline & French Company are doing the best and largest business in their experience. The revival was sudden and it is thought that it will die out as soon as the grip is mastered. Schandell & Lind report themselves very well pleased with their business for 1893, when everything is taken into consideration. French, Cave & Co. are another lucky house. They report an excellent fall trade. Their business in pharmaceutical specialties has increased in proportion with their other lines, and during the coming year they expect still more.

C. F. Cartwright has sold his drug store at Twelfth and Jefferson to Sydney L. Knissell. The latter was for many years in the employ of Bullock & Crenshaw.

Some sponges are coming to the Philadelphia market, but prices are getting higher with the demand on the increase. Other invoices are expected before the end of the year.

J. M. Maris & Co. are fitting up the drug store at Hazelton, Pa., for H. L. Smith. The new store is to be known and operated under the name of the Diamond Drug Company.

P. C. Brady, assistant bookkeeper in the city department of Smith, Kline & French Company, died on December 15 from heart disease. Mr. Brady was well known in the drug trade. He was with John M. Maris for over twenty-one years. He was well informed and had a host of acquaintances.

William R. Warner & Co. have felt the effect of the grip and their business is larger now than it has been for some time. This firm has one of the best localities in the city for its factory. It is unlike all others, as, in connection with the departments for the manufacture of

pharmaceuticals there is a large hall which can be used for concerts, church fairs and other entertainments. It has a seating capacity of 1,000 and is illuminated by electric light and gas.

About 150 members of the senior class, in charge of Prof. Remington and Assistant Prof. Ryan, on December 21 made the annual excursion to New York and Brooklyn for the purpose of inspecting chemical and pharmaceutical manufacturing plants. This is one of the big events of the senior year and those who enjoy it have a day replete with instruction and introduction to ways and means of doing things, getting information to be had in no other way. Dr. E. R. Squibb's laboratories, with their splendidly equipped appliances for all sorts of pharmaceutical work, were the center of interest, and there the most time was spent. The works of the Springer Torsion Balance Co. were also visited.

The results of the two preliminary junior class examinations, which took place during November and December, were announced on the evening of December 22, and were satisfactory to most of the 300 students who came up for the contest. Those who passed the examinations are now eligible for the final junior trial in March, and those who were not as successful can only take a modified examination, or none at all, and re-enter the junior class of next year. This plan of determining men's fitness for obtaining a scientific education has been found to be very satisfactory. Here a man shows in the first few months whether he is sufficiently advanced either in general education or absorptive faculty to proceed to more serious work.

The third social meeting of the Alumni Association of the College of Pharmacy was held on Tuesday afternoon, December 12, "Japan, France of the East" was the subject of a lecture by the Rev. John B. Gough Pidge, who recently made a seven months' tour around the world. The lecture was illustrated by a large number of beautiful pictures projected on a screen by an oxy-hydrogen light. The committee in charge of the meeting was composed of Dr. C. B. Lowe, Dr. A. W. Miller, William A. Bullock, Joseph W. England, and Dr. J. L. D. Morrison. The pharmaceutical meeting was held on the following Tuesday and a programme of much practical interest was presented. Henry Kraemer, Ph. G., read a paper entitled "The Columbian Exposition from a Botanical Standpoint." "Forestry at the Columbian Exposition" was a subject handled by Joseph Crawford, Ph. G., and a number of specimens of woods were shown. George M. Beringer, Ph. G., presented some "Notes on Resin Podo-phyllum" which were gathered in pharmaceutical manipulation. Alfred Leggos spoke of a new kind of tablet machine which he believed answered a good purpose. W. B. Thompson exhibited specimens of sugar of milk of unusually fine quality which he said had been made by the American Lactose Company, at Plainfield, N. J. The committee, who worked hard to secure the enjoyable programme, was formed of Prof. Henry Trimble, chairman; Messrs. Wallace Proctor, Dr. Clement E. Lowe, Joseph W. England and William L. Cliffe.

The drug clerks at Skowhegan, Me., have formed a society for study in matters pertaining to pharmacy.

DETROIT.

C. P. PARKILL.

Dr. C. P. Parkill, of Owosso, Mich., quietly sank to rest in his last, long sleep, on November 28. The drug trade of Michigan, in his death, loses one of its best representatives, and the community in which he lived an honored and respected citizen. He was a man whom it was an honor to know, and whose friendship was to be closely guarded, for he was loyal, true, and faithful, in principle and practice.

Dr. Parkill was born in Lewiston, N. Y., December 20, 1821, and thus was nearly 72 years of age at his death. At the age of 19, in 1840, he came to Michigan, settling at Owosso. Here, a varied experience in clerking, teaching school, and in the composing room of a country newspaper, culminated in a determination to study medicine. Preliminary study with Dr. J. B. Barnes was followed by attendance at Willoughby College, Ohio, from which he graduated in 1846. Then followed twenty years of experience as a country physician, at Bennington, a life than which there are few harder, combining heavy responsibility with arduous physical and mental exertion. In 1865 he returned to Owosso and established the drug business which has long been conducted under the firm name of Parkill & Son. In Owosso his character commanded respect, his scientific and literary attainments gave him power of thought and force of speech, and his geniality and large heartedness converted all acquaintances into friends. A leading attribute of his nature was a steadfastness, almost stubbornness, which he always exerted in support of the right. He was an ardent worker in the cause of temperance, and in politics he was the organizer of the Republican party in his district. In 1856 he served in the State Legislature, and took active part in the great conflict which resulted in emancipation of the slave.

In pharmaceutical affairs he always did all in his power to make and keep the profession what it should be. He was a charter member of the Michigan State Pharmaceutical Association, and was a regular attendant at its earlier

meetings; later his infirmities prevented his active participation. He was always a staunch supporter of the pharmacy law.

Dr. Parkill was a widely informed man, and possessed deep resources in an intellectual and literary sense. On all questions of current interest his extensive reading and careful habits of thought enabled him to arrive at an impartial, unbiased judgment, and his opinions were sought and valued. In religious matters he was always faithful, charitable, not bigoted, a consistent servant of his Master.

Dr. Parkill was married in 1848 to Miss Adelaide Howe, who joined her life with his in devotion to the higher interests and welfare of their fellows. She survives him, with her daughter and son. The latter, Stanley E. Parkill, has long been associated with his father in the drug business, which he will continue to conduct, together with his duties as secretary of the State Board of Pharmacy.

Christmas Day was one of considerable importance to some of Detroit's druggists, but perhaps none fared or were remembered better than was druggist F. W. R. Perry, who got up Christmas morning to find an appointment as a member of the Michigan Board of Pharmacy in his stocking. The vacancy which he was appointed to fill was caused by the retirement of Ald. James Vernor, whose term of office as a member of the board expired December 31. The appointment has been a question of considerable interest to the drug trade of Detroit, inasmuch as the precedent had been established that the appointee should be a resident of this section of the state. Mr. Vernor, the retiring member, has been a member of the board since its organization, and to his executive ability is due in no small sense its present high standing. Mr. Perry, the new member of the board, is comparatively young in years, but he is not young in the drug business. By education and experience he is well qualified for the position to which he has been appointed, and his many friends congratulate him upon his preferment.

A new drug store has been opened at Fennville by Clarence N. Memold.

Farrand, Williams & Clark presented \$5 to each of their employes as a Christmas present.

The drug store of J. J. Orr, Tecumseh, was damaged by fire December 12. Insurance, \$2,000.

Judge and Whitmarsh, druggists, 749 Grand River avenue, are succeeded by R. H. Whitmarsh.

The Chapotin and Gustin Drug Company is the name of a new drug firm doing business at 245 Woodward avenue.

S. P. Whitmarsh, a Palmyra druggist and well-known member of the Michigan Pharmaceutical Association, was a caller at the Era office a few days ago.

E. P. McCullough, representing Colgate & Co., New York, was a recent caller at the Era office. He was on his way to Washington, D. C., where he will spend the holidays.

J. O. Schlotterbeck, instructor in pharmacognosy and botany at the Michigan University, Ann Arbor, called on the Era December 23. He was on his way to Cincinnati, where he will spend the holidays.

Owen R. Ellis, superintendent of the Acme White Lead and Color Works, was given a handsome easy chair, as a Christmas present, by the workmen in his charge.

H. N. Paekert, a graduate of the Toronto College of Pharmacy, in the employ of P. F. Nasmyth, the Baker street pharmacist, was married recently to Miss Olga Niemler, of Neustadt, Ont.

S. W. King, a druggist of Muskegon, was arrested by United States authorities December 22. It is claimed that he misused the mails by sending a dunning letter on a postal card to a customer.

T. O. Lumsden, one of the Health Board inspectors of this city, has invented a pail for carrying sulphur and heating water at the same time, to be used under the new system of disinfection.

H. O. Fleming, brother of Mayor Fleming, Windsor, opened a new store in that city Christmas day. The fixtures are of the latest design and reflect great credit upon the exquisite taste displayed in their selection by the owner.

Walter Crawford, a former member of the firm of Johnson & Crawford, pharmacists, Milford, is now a successful real estate dealer in this city. Mr. Crawford is one of the best known business men in Oakland County.

J. E. Jessop has accepted a position as bookkeeper with Hazeltine & Perkins Drug Company, Grand Rapids. His former employers presented him with a check for \$250 in token of their appreciation of his faithful service to them.

The handsome fountain manufactured and exhibited by the Low Art Tile Company at the World's Fair, has recently been purchased and placed in Sanders' confectionery store, corner Michigan and Woodward avenues. It is a beauty and elicits many favorable comments.

The Grand Rapids Pharmaceutical Society, at its annual meeting, held December 12, elected the following officers for the ensuing year: President, W. K. Schmidt; vice-president, T. G. Aldworth; secretary and treasurer, B. Schrouder; trustees, F. J. Wurzburg, T. G. Aldworth, Henry Riechel and R. A. McWilliams.

A story is told on W. F. Griffith, a well-known traveler in the employ of Farrand, Williams & Clark. Some time ago, while at Clare, he ran up against a raffle in which a horse, buggy and harness was being raffled for the benefit of a sick man. He went on his way, thinking no more about the matter. While at Howell, some time later, he received a letter stating that the horse and outfit were his property by virtue of the drawing. He at once telegraphed to the parties to sell the rig and give one-half the proceeds to the sick man and send the balance to him.

Considerable interest has been exhibited in a controversy between Jacob Jesson, of Muskegon, and James Vernor, of this city, concerning the recent ruling made by the State Board of Pharmacy in requesting all candidates coming up for examination to supplement the statements made in their application for examination by an affidavit from some registered pharmacist in good standing, setting forth that the candidate has had three years' practical experience. Mr. Vernor, of course, defends the action of the board, while Mr. Jesson is very decidedly opposed to it.

CHICAGO.

Chicago, December 25. A few days previous to the recent municipal election held in this city, a manifesto signed by Albert E. Ebert was circulated among members of the drug trade, asking them to use their influence against the election of the candidate for mayor upon the Democratic ticket, John P. Hopkins, on the ground that he had been prominently connected with the "cut-rate department stores" at Pullman and Kensington. Mr. Hopkins was elected, however, by a small majority.

O. F. Fuller, of the Fuller & Fuller Co., made a business trip to New York last month.

The Japanese Remedy Co., 153 So. Western avenue, changes its name to the Jas. H. Johnson Co.

E. T. Richards, successor to the La Fayette pharmacy, No. 143 35th street, has removed to 111 West Madison street.

The regular meeting of the Section of Chemistry, Chicago Academy of Sciences, was held December 19 in room 48, Athenaeum building.

Pingree & Treakle, the patent medicine manufacturers, have dissolved partnership, and the business is now conducted by Dr. M. G. Pingree, Suite A, No. 241 Wabash avenue.

Giles Lewis, of the firm of Robert Stevenson & Co., was one of the witnesses in the Cronin murder case. Mr. Lewis had no direct connection with the case, but simply testified as to the death of his brother, who was Dr. Cronin's dentist.

The grip must have struck Chicago pretty hard, if one may thus conclude from the theft of two cases containing over 25,000 cough lozenges from a drug in front of the Tremont House drug store on December 13. George P. Martin, the owner, reported the loss to the police.

The condition of trade just at present was aptly described by a reporter on one of the daily papers. At the banks he found business apathetic, in the stores slack, and at the saloons "on the hog train;" druggists reported slow trade; when a customer came in with a prescription, he would ask "How much?" and, if the price were not low enough, he would walk out and the prescription with him.

Edward Haller, of the John Block Drug Co., suffered a very painful and serious accident a few days ago. Upon alighting from a street car, the muscles of the calf of the leg were torn apart, the smaller from the larger, and it is predicted this leg will always be stiff. Mr. Haller holds an accident policy, but naturally feels that \$5 or \$50 weekly indemnity is meager consolation for enforced neglect of business duties and the probability of a stiff limb.

Fred M. Schmidt, who may be said to be "high up" in pharmaceutical affairs, inasmuch as he owns the prescription drug store on the tenth floor of the Schiller building has, as the Era intimated, been appointed a member of the Illinois State Board of Pharmacy, a good appointment and one that gives very general satisfaction. He has some sound ideas on the professional aspect of pharmacy.

There were plenty of wholesale druggists in town a couple of weeks since. They came from all sections of the country between the Monongahela and the Mississippi to attend a meeting of job-

bers to discuss trade questions. The Detroit plan for regulating the patent medicine traffic was liberally discussed by the fifty or more present, and a strong sentiment in its favor was manifested. C. P. Walbridge, of the St. Louis firm, Merrill Drug Co., and mayor of that city, presided.

Jonas & Christensen, druggists at 84 West Madison street, have been treating their store to a new coat of paint, decorating the ceiling and furnishing up generally. F. E. Leake is a newly engaged assistant. All three gentlemen are graduates in the class of '93, Illinois College of Pharmacy. Mr. Christensen was married recently at Racine, Wis., and finding this example contagious, and evidently believing still another partner was needed, Mr. Jonas tied himself toledward just before Christmas, and on December 23 was married to Miss Maria Crawford, of that city. This firm is certainly enterprising in more ways than one.

PEORIA, ILL.

Holiday business has been very quiet this year. Merchants have been somewhat averse to making large displays of Christmas goods, and consequently their supply of stock for the holiday trade has been very limited. The druggist has had to content himself in expending his energies against the cut-rate business, which, with one exception, has been nearly annihilated in this city. That exception has been in the sale of hot water bottles and fountain syringes, and it has made the druggist feel very sore. Goods that once netted him a fair profit in winter, as these have done, are now cut so close that the best of stoppers will not stop them.

The results of treatment practiced by the numerous bichloride institutes in the country crop out occasionally in an unsatisfactory way. In this city a number of patients who had taken the treatment died and a number have been declared insane. The remedy used is not the harmless gold salt, but is rather a solution containing strong alkaloids, such as strychnine, atropine, apomorphine and other concoctions of a fanciful nature. The indiscriminate use of these remedies by broken-down physicians who have failed to make a success in their profession through an inexcusable amount of laziness and hatred of study, cannot be expected to terminate in any other way.

Druggists in the future will have to be more careful in the way they allow their clerks to handle cigars. The law requires the salesman to hand out the box whenever a sale is made, the customer choosing or making his own selection. The necessity of observing the law was illustrated in this city recently, where a certain firm had in stock a box which contained eight cigars of different brands. A deputy of the revenue department noticed and confiscated them. The members of the firm explained that in handing out the cigars and returning those not sold some of them had dropped into the wrong box. No arrests have yet been made.

Retail druggists in this city are very much interested in a suit to test the validity of a city ordinance which requires every druggist doing business to pay a fee of \$25. In refusing to pay this fee the city officials have selected Mr. Sam Coffinberry as the target of their malice, and the rest of the druggists await the outcome of the trial.

ST. LOUIS.

St. Louis December 23.—The holiday trade in this city was all that could be expected, and more if anything. Both wholesale and retail houses have held their own remarkably well, and future prospects are refreshing. A marked improvement in the drug trade could be noticed during the holidays and a spirit of jollity has pervaded pharmaceutical circles. The proposed tariff revision, which includes many important staples in the drug line, has attracted considerable interest, and much speculation is being indulged in relative to the effect the passage of the Wilson bill will have on the drug trade.

A large audience attended the third monthly scientific meeting of the Alumni Association of the St. Louis College of Pharmacy, Tuesday evening, December 19, at the college building. The eloquent lecture on "World's Formation," delivered by Otto A. Wall, professor of materia medica and pharmacognosy, was listened to with a polite attentiveness. The lecture was something of an oratorical treat, and the audience showed its appreciation of the many novel ideas presented by applauding generously. Other lectures will follow in the near future.

At a caucus held by the members of the Western Commercial Travelers' Association at the Lindell Hotel a few days since, John S. Moffitt, of the Moffitt-Weat Drug Company, was selected as the first vice-president on the caucus ticket for officers. Mr. Moffitt seemed to be the strongest candidate for president, and might have secured the nomination but for the fact that a previous caucus had been held by "a select few," who fixed upon George S. McGrew for the position and carried him through successfully. An opposition ticket has also been placed in the field, and the race for offices promises to be interesting as well as spirited. The annual meeting of the association will be held December 26 at the Lindell Hotel.

The regular monthly meeting of the St. Louis Paint, Oil and Drug Club was held at the Mercantile Club house December 14, a week ahead of the usual time, owing to the fact that the New England Society had previously engaged the club house for December 21. After a bountiful supper, President D. P. Daugherty, of the Daugherty-Crouch Drug Company, called the meeting to order. In behalf of the delegates to the recent convention of the National Association at Pittsburg, Mr. Walker Evans submitted an interesting statement of the important improvements that the association is trying to accomplish in government and business affairs. A communication was read by Secretary Melvin H. Stearns suggesting that paint and oil clubs of the United States employ chemists for the purpose of detecting adulterations in linseed oil. Mr. N. O. Nelson followed with an eloquent address to the club on the co-operative and profit-sharing plan. The club will hold its next meeting on the third Thursday in January.

Sol. G. Boehm, the well known druggist of No. 800 Morgan street, was tendered a very pleasant serenade by several hundred friends a few nights since in honor of his appointment as Justice of the Peace of the Sixth District. He led the party to Wenzell's hall, not far distant, where a lunch was served.

Speeches were made by Judge Boehm, Recorder Wm. Hobbs, ex-Councilman Benstick, Dr. G. J. Hermann, J. J. Curley, David Stahl and others. Mr. Boehm is making an enviable record as Justice of the Peace.

Thos. Knoebel, the well known pharmacist of East St. Louis, has been selected as a candidate for the Illinois Board of Pharmacy from the Twenty-sixth District.

The suit for divorce filed by Mrs. Mae Schaefer against her husband, Henry J. Schaefer, druggist, No. 1703 Chouteau avenue, has been thrown out of court and the couple will try it again.

Hon. Cyrus P. Walbridge, Mayor of the City of St. Louis, and president of the Merrell Drug Company, recently visited Chicago to preside at a meeting of the Western Wholesale Associated Druggists.

The talk by the retail druggists of establishing a co-operative jobbing house in this city, as a result of the action of the wholesalers a short time ago, has subsided and the pipe of peace is being smoked by all.

The Lambert Pharmaceutical, of this city, are being kept busy prosecuting imitators of their product, Listerine.

Emil Whitney, formerly connected with Fernow's establishment, has opened an office in the new Union Trust building, Seventh and Olive streets, where prescriptions only will be dispensed.

Several simple-minded persons have recently asserted that the drug stores which have been made branch offices of the Laclede Gas Light Company, have been charging a commission on bills paid. In this way, it was said, the people were being swindled out of about \$30,000 annually. The charge is indignantly denied.

PITTSBURGH.

Pittsburg, December 26.—Pittsburg and Allegheny druggists, notwithstanding the panic, made several efforts to prepare holiday displays, and their windows show the effect of careful work. Particular pains are shown in the arrangement of lines of soaps, perfumes, cigars and various toilet preparations. The windows of Louis Emanuel, Eggers & Son, Greenfield's Duquesne Pharmacy, Pittsburg, were specially worthy of mention. Kaercher, Federal street, Allegheny, presents to view a revolving Christmas tree five feet in height. Trade continues dull, and collections are extremely difficult.

The Pittsburg free dispensary is playing an important part in the relief of suffering which exists this year to an extent never before known in this vicinity. At least 6,000 families are destitute and require assistance to keep off absolute starvation. Patients are prescribed for by the board of charities physician and medicine is then furnished at the dispensary.

The Homeopathic hospital has just gone through a dire affliction in the shape of a small-pox quarantine. The disease developed into serious proportions and seventy-five patients, under treatment for various ailments were penned up by the state and city boards of health. Policeman Thomas, of Jeannette, a flourishing town near Pittsburg, was released from the hospital, but soon was stricken with small-pox and died. Simultaneously with his illness several cases were discovered in Pittsburg. This state of affairs resulted in the instant closing of the hos-

pital, and the patients have just been released after more than a month's imprisonment.

Dr. D. R. Brent, in discussing the evolution of the drug store and the preparation of triturates, declares that, in his opinion, it is a question whether this latest development has come to stay.

A child of Chas. Beck, a Sharpsburg druggist, accidentally took poison a week ago, and its life was saved only by hard work on the part of the physician. The child was playing in the store, and, it is supposed, got hold of some drug, just what is not known.

The monks of St. Vincent's abbey, near Latrobe, are anxious to get a change, or at least a special rendering of the internal revenue laws to cover their case. They brew beer for their own consumption, but are placed liable to tax owing to the fact that the building in which the brewing is done is separate from that containing their dining and living rooms. They have appealed to congress for relief.

Considerable discussion among local physicians has been aroused on the subject of the science of being left-handed, and the phenomenon of mirror-writing. Dr. Winslow, who is ambidextrous, declares that mirror-writing is simply a symptom of the cerebral talent, and indicates that the person possessing it has double the cerebral functions of an ordinary man.

INDIANAPOLIS.

Indianapolis, December 23.—Councilman Colter says he will reintroduce the city ordinance requiring drug stores that retail liquor to pay equal license with the saloons, \$250 a year. He says that leading druggists who do not retail liquor went to the Saloonkeepers' League when the latter were endeavoring to get the Grossert bill through the legislature, and said that the sale of liquor was demoralizing the drug business. They also appeared before the legislative committee on temperance and urged it to report favorably on the bill, which is identical with the Colter ordinance defeated in the city council two or three weeks ago. The druggists referred to acknowledge the corn, but say that the one was a state law and the other is a city law, unfair and not able to stand the tests of courts. Paying a city license also means the paying of government and county licenses and the total would be \$375 a year. Druggists now pay a tax for the privilege of selling, but cannot sell more than four and one-half gallons of alcohol at one time without taking out also a wholesaler's license. It is said that, if the city should pass the ordinance and assess the druggists \$250 the state law would not then permit the druggists to retail liquor to be drunk upon the premises, but would even revoke the licenses. Under the state law the city may prosecute for violation, or assess a tax, but cannot issue licenses of its own authority. Controller Trusler, the financial head of the city, wants the ordinance passed, and says, "Men who want to drink whiskey should get it at saloons, and drug stores should not be made tippie shops."

There have been only four attempts at morphine suicide during the past two weeks in this city.

A. C. Koehne, formerly of the Stewart drug house, now market-master, is favor-

ably mentioned as a candidate for county recorder on the Republican ticket.

George D. Price, a young druggist of Seymour, has received the appointment of postmaster of that town.

Thieves made a raid on L. V. Conwell's and Canady's drug stores at Van Buren on the night of the 18th inst., getting goods to the amount of about \$50.

The commercial travelers have organized a relief association, and the drug men are represented by M. P. Lynch, T. J. Cook, H. D. Porterfield and S. A. Fisher.

An employe of the Schmidt brewery in this city was seriously injured on the 8th inst. by a terrific explosion of gas which followed the lighting of a match in one of the dark beer cellars. He was inspecting an empty cask at the time.

Chemist Eisenbeiss asks the county for \$1,250 for five analyses of the stomach contents of the members of the Koerster family, for whose murder by poison Anna Wagner was tried and acquitted. Drs. Latz and Geis also ask \$50 for analyzing "Rough on Rats."

Druggist Geo. W. Sloan, whose interest in the public affairs of this city has been previously noted in these columns, has a new scheme—to have electricity and trolley-wire excursion boats on the canal next summer to convey Indianapolis to the summer resort of Broad Ripple.

Hiram Lindley, a lifetime druggist, died at Bloomington on the 9th inst. He had been in the business there nineteen years. He was seventy years of age and left a widow and four children. He was one of the pioneer settlers, was prominent in the Friends' Church and in social and public life, and was of kindly impulses and sterling character—an honor to his profession.

John W. Stokes is a clerk in Sloan's drug store. Joseph Deitch, an old man, with whom Mrs. Stokes had formerly lived, died two weeks ago, and in an old safe in his bedroom was found \$134,000 in gold and notes. In the will \$5,000 was bequeathed to Mrs. Stokes, but the codicil cut her off. Supposed that the old man was hurt at his favorite's leaving him and marrying.

Councilman A. G. Eilar, formerly a prominent druggist of New Castle, was arrested on the 12th inst. on the charge of getting money under false pretenses, preferred by Dr. Luther Oylar, of Kokomo. Eilar is said to be a high-roller and spent money lavishly when on visits to Kokomo. He borrowed \$100 from the doctor, giving him a worthless check on a New Castle bank. Eilar is out on bond to await the convening of court.

Lewis Stockman, druggist at Illinois and Michigan streets, is a hero in the estimation of his fellow-members of the profession here. He captured a live burglar early on the morning of the 8th inst. He was awakened about 1 o'clock while in his couch in the rear part of the store, and he saw a dark form moving about. He saw the stranger help himself to cigarettes and then advance on the cash drawer. He arose, lifted up his revolver and called out, "Hold on, there." The next minute a hatchet came crashing through the prescription case in the direction of his head. The revolver went "bang, bang," and the robber threw up his hands. Stockman kept him covered while he telephoned for the patrol wagon, which arrived in a remarkably short space of time.

CLEVELAND.

Cleveland, December 23.—It is quite probable that the Legislature may reframe the poison law in order that it may more adequately meet the requirements and admit of uniform observance. The present law is virtually a dead letter, due to its looseness of construction and the neglect of the proper authorities in the matter of its enforcement. The poison law of Ohio requires that arsenic must be mixed with soot or indigo before it is sold, and that with all poisons the name, residence, age, sex and color of the buyer must be registered by the druggist, together with the date and the purpose for which the article is to be used. Farther, no poison can be sold without the prescription of a physician. In the case of morphine, neither it nor any of its salts can be sold in greater quantities than one dram, and it must be wrapped in scarlet paper and both wrapper and bottle bear scarlet label lettered in white. Penalties for violation of the law range from \$10 to \$200. Druggists would observe the law if it were so constituted that violation of it would be too dangerous, but, as it is, anyone can get a prescription for any article, and the druggists know this, and, if one refuses, his competitor on the next corner is willing to sell the article.

The \$500 state liquor bill is to have a competitor in a bill which will provide for a reduction of the present tax on beer-sellers from \$250 to \$100 per year, and making an assessment of fifty cents per barrel. The father of the bill is now endeavoring to find a way of reaching the whisky distillers on a similar basis. It is said that several local manufacturers are keeping their representatives busy framing measures against the drug trade. This is one phase of the proposed legislation.

The cut-rate schedule in force here some believe will result in wholesalers dropping some of the proprietary medicines from their stocks because the reductions now asked by the retailers will not leave the required margin. To avert this action, one druggist expressed the belief that patent medicine manufacturers will refuse supplies to all of the cutters, but a majority of the trade are a little skeptical on this point.

The druggists who paid the first installment of the cigarette tax, now that the second is due, are, many of them, dropping this line of goods. They claim that the sale of cigarettes has proved to be an unattractive feature of the business, and the few who continue the line do it merely for the accommodation of patrons.

A bill which has been framed by Dr. H. C. Scott, and which was to form the subject of consideration by the members of the medical profession of the state, at a meeting on December 1 at the Nell House in Columbus, places the medical fraternity on a basis similar to that of the registered pharmacist so far as regards legal qualification.

Dr. Martin L. Brooks, who has been practicing medicine in this city for over fifty years, celebrated his eightieth birthday December 8. His reminiscences of the early days of the medical and pharmaceutical professions are very interesting and demonstrate the highly satisfactory growth Cleveland has enjoyed within the last one-half century.

The holiday business has been very satisfactory.

The Cleveland Store Fixture Company is turning out some fine drug store outfits.

Strong, Cobb & Co. report a steadily increasing business in paints, oils and varnishes.

Cleveland druggists pay about \$13,000 annually into the treasury of the telephone company.

Stechor Bros. are the busiest retail druggists in town since they entered the barbers' supply business.

Physicians' registration laws, similar to that proposed for Ohio, are now in force in about thirty-five states.

J. L. Johnson's drug store at Parkman was burglarized on the night of December 10. Loss, one dozen gold chains and some money.

Louis Smithnight, of the Erie street firm of L. Smithnight & Son, was one of the organizers of the Cleveland Light Artillery in 1873.

Wm. G. Marshall, Public Square druggist, says the hard times have cured more drunkenness than all other known remedies put together.

Ed. Wolf, salesman for Strong, Cobb & Co., while on a visit to Orrville, slipped and fell on the icy sidewalk and received several injuries of the head.

There are about twenty paint manufacturers in Cleveland, and more than fifty distributors and wholesale and retail dealers in oils, paints and varnishes.

The Ohio Chemical Company, of Lima, which has been selling so-called bichloride of gold tablets, and the Keeley institute at Cuyahoga Falls, are in the hands of receivers.

Whiskey has been moving very freely of late, stimulated by the new revenue policy. The wholesale druggists do not find it hard to purchase supplies if they express a wish to do so.

The agent of the "Star" cut-rate drug store, in his newspaper advertisements is boldly defying what he terms a druggists' combine, and quotes prices below the cut-rate schedule adopted by the C. P. A.

The salesmen of the Sherwin-Williams Co. came in from every corner of the country to attend the annual love feast of this firm and its employes which this year took place December 11 at the Hollenden.

In 1829 Cleveland had but four drug stores, which depended for support upon the occupants of 168 dwellings. In 1835 there were 30 oil refineries, now there are some 30 concerns represented. In 1856 the Board of Health was organized, consequent upon the cholera scare.

Dr. William Bushnell, of Mansfield, who died a short time since, aged 93 years, was long a member of the legislature, served as a delegate to the International Prison Congress at Stockholm in 1873, was a member of the Ohio and American Medical Associations, and an authority on medical questions.

A number of Cleveland druggists are holding commissions as stamp agents and they are wondering whether the system will be extended by the future incumbent of the postmaster's position. Many think there should be considerable increase in the number of these agencies, so that the drug trade may get an adequate compensation for accommodating the public with postal material.

KANSAS CITY.

Kansas City, Mo., December 26, 1893.

There has been a marked improvement in the general condition of the drug market in this city and the southwest during the month of December, which need not all be laid to the season. The financial stringency, which was so general, has in a great measure been abated and the world seems back to its normal condition again. The wholesale druggists say that they expect an unusually heavy business this winter, because the retail dealers, who have been forced to cut their orders and keep their stocks down to the lowest living point will recognize the return of better times and take an early opportunity to buy again. The druggist's business is, per force, a business of necessity, and "hard times" are not so readily felt by him as by men who deal in the luxuries of life, but the books will show a great decrease in the volume of business for the last half of the past year. Nevertheless, there have been fewer failures in the drug business throughout the southwest during the past year than in almost any other branch of business. The western druggist is at all times a careful business man.

Kansas City has a very unobtrusive, but a very lively organization known as the Kansas City Paint, Oil and Varnish Club, which has a happy habit of meeting around the banquet table at the Coates Hotel once every two months, and after the candle has been passed and the air is blue with smoke, of dropping many bits of wisdom, sometimes highly colored, oiled and varnished. Such a gathering was held there on the night of December 14, when President Frederick N. Sewall reported the proceedings of the National convention at Pittsburg, to which he was a delegate, and the club congratulated H. D. Cutler on his election as vice-president of the National Association. Eighteen members of the club were present.

The great necessity of reform in the style of "containers" for poisons was again illustrated a few days ago, when, at Olache, Kas., Gertrude Canutt, 14 years of age, was poisoned to death by a dose of carbolic acid, administered to her by a nurse, who mistook it for medicine. A few days ago a Kansas City druggist sold a man a dime's worth of arsenic, wrapping it in a piece of brown paper, on which he wrote with a faintly colored pencil the words: "Arsenic, poison." The man tried to commit suicide with the poison, but his life was saved.

Burglars broke into John R. Conley's drug store in the First National Bank building, Kansas City, Kas., and stole \$100 worth of goods a few nights ago.

G. Howard Willett fell from a step ladder a few days ago and severely sprained his ankle. He will be forced to use crutches for some time.

Hugh Arnold, son of H. C. Arnold, is now a clerk in his father's drug store, where he is learning the mysteries of the prescription case.

A safe brawler under arrest at Whitesboro, near Dallas, Tex., has been identified as H. A. McMillen, who conducted a drug store at the corner of Eleventh and Walnut streets, in this city, four years ago.

Randall & Whitney, who have long had a drug store at the corner of Fifth and

Central streets, have bought Miss C. Farabee's drug store at the corner of Twelfth and Locust streets, and will hereafter run both stores.

S. Hirsch & Co. filed a motion in Judge Henry's court that J. V. Ellard, receiver for the Palmer & Keith Manufacturing Company, a drug concern at the corner of Twelfth street and Broadway, be ordered to pay them a claim of \$63.06 for goods sold and delivered.

Dr. S. H. Wainwright, for eight years a medical missionary stationed at Kobe, Japan, and a brother of Dr. Charles F. Wainwright, of Kansas City, read an interesting paper on the medical practice of Japan and the Chinese theory of disease and medicine before the Kansas City Academy of Medicine a few nights ago.

E. W. Adams, formerly proprietor of the Pendleton Heights Pharmacy, has bought the Schoen drug store at the corner of Fifth and Wyandotte streets. Mr. Schoen is preparing, as mentioned in a recent issue of the Era, to open a prescription pharmacy in the Riakto building. After completing the purchase of the store Mr. Adams sold a half interest to Mrs. Catherine E. Rose for \$1,250.

Horace S. Lynn, president of the Mineral Milling Company, and vice-president and treasurer of the suspended Continental Trust Company, of Kansas City, was arrested a few days ago charged with grand larceny by receiving deposits into the trust and banking company, knowing it to be in a failing condition. Frank A. Faxon and J. C. Horten, of the firm of Woodward, Faxon & Co., became his bondsmen for appearance in court.

F. R. Rice & Co., cigarmakers, of St. Louis, have secured a temporary injunction against the James O'Brien Cigar Manufacturing Company, of Kansas City, preventing the latter from manufacturing the "Americantle" cigar, which they claim is an infringement of their trade mark, "Mercantile." The case will be heard in January in the Circuit Court. Both cigars are handled almost exclusively by drug stores.

The Kansas City College of Pharmacy has established a pharmacological laboratory in the building of the Kansas City Book and News Company on Main street, north of Eighth street. Lectures are still given in the rooms of the University Medical College and the students use the chemical laboratory of the medical college. The College of Pharmacy has outgrown its accommodations there and this fall has established the branch laboratory, as a matter of necessity.

A fire of incendiary origin broke out in Druggist R. J. Holmes' carbonating works, No. 2404 East Fifteenth street, a few nights ago. It was put out by the firemen before more than \$100 damage was done. Assistant Chief Trickett made an investigation and found a pail of coal oil and a cup in the building, and traces of oil on the woodwork. A man was seen in the building a few minutes before the fire broke out, but when the firemen arrived the place was locked up. The building was insured. Mr. Holmes' drug store at the corner of Ninth street and Prospect avenue was destroyed by fire a year ago.

R. J. Holmes has begun suit for \$1,500 damages against Louis W. Craig for an alleged breach of contract for the sale of his store, which was mentioned in a recent issue of the Era. Mr. Holmes says in his petition that on December 1, 1883, he sold his drug store, at the northwest

corner of Eleventh and Walnut streets, to the defendant, with stock, fixtures, lease on building, good will, etc., and agreed to take notes secured by real estate for payment, the whole consideration being \$6,000. The contract was made out and signed, it is alleged, and placed in escrow with the drug store in the hands of J. C. Neal. But before the plaintiff had examined the real estate he alleges that the defendant notified him that he had backed out. The plaintiff says he was damaged, and wants a judgment of \$1,500.

THE SOUTHWEST.

Andrew J. Arnold, a prominent druggist in Topeka, Kas., has been appointed postmaster of that city by President Cleveland.

A burglar broke into the house of Richard Platt, of the Platt & Thornborough Paint Company, St. Louis, and stole \$300 worth of jewelry and clothing.

O. D. Harris, a druggist and grocer at Whitney, Tex., failed a few days ago. He made a deed of trust securing local creditors to the extent of \$10,000.

L. W. Robinson's drug store at Durant, I. T., was destroyed by a fire which wiped out half a dozen stores in that town, not long ago. His loss was about \$1,500.

The Thurmond Chemical Company, of Dallas, Tex., has been incorporated with a capital stock of \$25,000. The directors are W. J. Thurmond, W. A. Shaw and W. Kirby.

The Burnett Paint Company, of Wichita, Kas., has been incorporated with a capital stock of \$50,000. The directors are Hiram Burnett, James Burnett, O. H. Bentley, C. R. Burnett and Rudolph Hatfield, all residents of Wichita.

The American Antiseptic Company, of East St. Louis, has filed articles of incorporation with a capital stock of half a million dollars. The organizers of the company are Louis Wheelock, Isaac D. Stone and John C. Mussick.

The Kansas State Board of Charities met at Topeka a few days ago and awarded contracts for supplies for the various state institutions. The contracts for drugs were let to Andrew J. Arnold, Swift & Holliday and J. K. Jones, druggists, of Topeka.

A certificate of incorporation has been issued to the Lankford Chemical Company, recently organized at Galveston, Tex. It has a capital stock of \$10,000. The incorporators are: E. E. Lankford, George A. Lankford, A. Robertson, W. Hall and H. J. Labatt.

The A. B. Whiting Paint and Glass Company, of Topeka, Kas., has filed articles of incorporation with a capital stock of \$10,000. The directors are A. E. Whiting, A. L. Whiting, E. E. Merriam, J. K. Jones and E. H. Jones. They all live in Topeka and J. K. Jones is a druggist there.

A window in John C. Philbrick's drug store at Oregon, Mo., was being decorated for the holidays by R. Hinnen, the manager, when he dropped a match on the cotton trimmings and soon the contents of the window were ruined, making considerable loss. The fire was kept from reaching the contents of the store.

A disastrous fire broke out at Waxahachie, Ellis county, Tex., December 19, and destroyed the business part of the town. W. G. Lamar's drug store was destroyed, making a loss of \$8,000 on stock and \$5,000 on the building, and Lancaster

& Mathews' stock of drugs and books was burned with a loss of \$15,000 on stock and \$5,000 on building. The losses are about covered by insurance.

In the big fire at Hannibal, Mo., W. W. White's drug store was destroyed. His loss was \$500, covered by insurance. A. A. Allhouse was compelled to hastily move his stock to a place of safety, and he lost considerable by theft and breakage. Robinson Eros', stores, stocked with paints, oils and varnishes, were destroyed. Their loss, including their two buildings, was about \$30,500, with \$20,000 insurance.

ATLANTA.

Atlanta, Ga., December 23.—The drug trade of this city has suffered greatly from the hard times which it seems will never abate. Physicians are doing very little, and, while the grip is raging here, people prefer to dose themselves rather than to pay a physician. Collections are very poor indeed. The streets are crowded with people who, however, do very little trading, and especially a few druggists have laid in an extra supply of fancy goods, etc.

The Adams Paint, Oil and Drug Co., Savannah, Ga., has been incorporated with a capital stock of \$10,000.

R. R. Evans, manager of the Lamar & Rankin Drug Co., has gone to Knoxville, Tenn., to spend the holidays.

The firm of O'Keefe & Fleming, of the Aragon pharmacy, has been dissolved, and is succeeded by Fleming & Co.

D. R. Stauffacher, who has been representing the Wm. S. Merrell Chemical Co. in this territory, has connected himself with another house as traveling salesman.

The selling fever seems to have struck the druggists of Atlanta, as two druggists have advertised their business for sale, one being C. E. Sewell, 178 Whitehall street.

The King's Royal Germeteur Company has filed a petition with the clerk of the Superior Court to reduce their capital stock from \$350,000 to \$140,000, and to change the par value of shares from \$100 to \$10 each.

Smith & Dozier, corner Whitehall and Mitchell streets, have sold their fount and all appurtenances to Willis Venable, who will, it is said, conduct the business at the old stand.

It is rumored that a new firm will commence business in Atlanta, about January 1st, to manufacture elder, vinegar, and flavoring extracts, and will cater mostly to the country trade.

Strong efforts were made at the meeting of the Legislature, which recently adjourned, to create a state board of health, the need of which was clearly pointed out during the recent epidemic of yellow fever at Brunswick. Gov. Northen advocated it in his message, but it seems that the Legislature has not done its duty and created such a board. It is hoped that this question will again be brought up and passed at the next meeting of the Legislature.

An act has passed the House in the Georgia Legislature to put druggists' bills against an estate on the same footing with physicians' claims. The Georgia druggist is in a fair way to be recognized as a preferred creditor.

BOARDS OF PHARMACY.

The Georgia Board of Pharmacy met at Atlanta November 27 and examined a class of fifteen. The following persons were granted licenses as pharmacists: J. O. Baker, Savannah; J. W. Hildout, Macon. Apothecaries were Reuben Kelly, Atlanta, Martin Meadows, N. J. Gillespie, Macon. The druggists were E. S. Britton, A. G. Scriven, W. W. McAfee, Atlanta; A. B. Greene, Manlita, and B. F. Herring, Cordelle. Mr. S. C. Durban was sworn in by Gov. Northen for a five years' term. The old officers, John W. Goodwyn, chairman, and H. I. Slack, secretary, were re-elected. Mr. J. C. Baker passed the best examination and was awarded the complimentary Interstate certificate. The board determined to offer, as a special prize, a membership in the American Pharmaceutical Association to the candidate who should pass the best examination during the year. Any pharmacist can try for the prize, even though he be already licensed, provided he has not been before the board more than twice. The object of the prize is to encourage further study among the licentiates. After January 1, 1894, the candidate will be required to pass sixty-five per cent of the questions asked by the board instead of sixty per cent, as heretofore.

The Illinois State Board of Pharmacy, at the practical examination held at Chicago November 21, 22, 1893, granted certificates as registered pharmacists, by examination, to the following persons: A. A. Andres, A. C. Cole, F. B. Hildebrandt, E. A. H. Laddish, C. E. Perkins, A. Rosenwald, J. B. Sutton, of Chicago; and D. W. Rockwell, Jerseyville. Assistant pharmacists: H. W. Brown, L. A. Busse, R. H. Butler, F. W. Dudley, J. T. Edward, J. H. Greves, C. J. Habegger, J. Hooper, F. W. Keuper, W. T. Liddell, A. A. Moskiewicz, A. J. Seyster, R. J. Thretheway, E. J. Weeks, C. F. Worm, of Chicago; W. A. Dixon, Decatur; O. P. Morse, Rogers Park; H. H. Vanatter, Joliet; G. W. Wagner, Oak Park. Twelve failed to pass a satisfactory examination. The next meeting of the board for examination will be held at Springfield, January 9, 1894, in Room 3, State House. The second meeting of the board for examination and other business will be held February 13, 1894, at 9 o'clock a. m., No. 175 Thirty-ninth street, Chicago.

Louisiana Board of Pharmacy, at its November meeting, granted certificates as registered pharmacists to D. F. Goldsby, Amite City; Gustave Katz, New Orleans; F. C. Latolais, Broussard; A. L. Martin, New Orleans; C. H. Germain, Lake Arthur. At the examination the following were successful in securing A. P. certificates: A. Broussard, Rayne; A. K. Grace, Plaquemine; Jos. A. Lang, New Orleans; Geo. E. LeRay, Crosby Landing; J. E. Mickelson, New Orleans; J. M. Oliver, New Iberia. Qualified assistants certificates: E. J. Bastian, New Orleans; A. E. Blanchard, Plaquemine. Successful candidates will hereafter be required to answer 70 per cent of the questions asked by the board in an examination. A committee was appointed by the board to draw up amendments to the pharmacy law. The board holds its next meeting February 10, 1894.

The Kansas Board of Pharmacy held its fourth quarterly meeting at Concordia

December 6th, 1893. Twenty-seven applicants for registration appeared for examination. Certificates as registered pharmacists were issued to the following: A. H. Hodley, Minneapolis; W. W. Griswell, Clatfin; J. G. Campbell, Oberlin; J. T. Clements, Neosho Falls; J. H. Dykes, Lebanon; Fr. A. Eckdall, Emporia; H. O. Hardesty, Beamsville; A. N. Miller, Junction City; J. A. Miesel, Kansas City; C. V. McCaughan, Olathe; J. N. Nelson, Concordia; E. H. Thompson, Ottawa. Assistant: O. A. Keene, Topeka. Ft. Scott, March 7th, 1894, was selected as the time and place of the next meeting. Examinations begin at 9 a. m. and are for one day only.

Massachusetts' Board of Pharmacy recently examined a class of forty-three applicants. As a result of the examination certificates were issued to the following: Edward B. Moulton, of Cohasset; Carlton W. Crocker, Jr., East Boston; Austin C. Dinsmore, Fitchburg; Harry D. Wheeler, South Boston; Wm. H. Bodroo, South Boston; Rollin A. Munroe, Malden; James H. Hayes, East Boston; Frank W. Dickinson, Boston.

Connecticut Board of Pharmacy has arranged to supplement its oral and written examinations by one of a practical nature. A well equipped dispensary has been arranged for this purpose in one of the capitol rooms at Hartford, where the applicant will be put through a series of practical tests in dispensing and compounding.

Missouri Board of Pharmacy will hold its next meeting at Liederkranz Hall, St. Louis, January 8 to examine candidates for registration. Candidates will be examined individually by the board, and not by a schedule of questions to be answered and subscribed to by the candidate under oath, as heretofore.

Washington Board of Pharmacy meets at Spokane January 8th for the purpose of examining applicants for registration.

Missouri Pharmaceutical Association will hold its next regular meeting at Excelsior Springs, June 12 to 15 inclusive. The association has received thirteen applications for membership.

PROCEEDINGS N. W. D. A.

Secretary Merriam has been very prompt in getting out the report of the Detroit meeting, held last October. The pamphlet contains 240 pages, and is embellished by an excellent portrait of President Frank A. Faxon. Its contained committee reports are valuable for information and reference.

Sibley, Lindsay & Curr, Rochester, N. Y., have placed their drug department in charge of Ross L. Rainsford, a licentiate of the New York State Board of Pharmacy by examination.

From figures compiled by the Army and Navy Journal it is learned that of the 10,000 men enlisted in the army during the past year, 39 were druggists, 2 were chemists and 2 were dentists.

Thirty drug stores at Topeka, Kas., have license to sell liquor for medicinal, mechanical and scientific purposes, and during the month of November last they made 6,246 such sales, or an average of over 206 for each. The highest and lowest number of sales reported to the Probate Judge are 500 and 86 respectively.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

AN ODDIOUS TRAFFIC.

To the Editor of The Pharmaceutical Era:

Under the above heading, Messrs. Parke, Davis & Co., of this city, have an article in their organ, "The Bulletin of Pharmacy," which is published by their general manager, Mr. Geo. S. Davis. They quote from the preface of one of our catalogues, our statement regarding our make of non-secret medicines, as follows: "Non-secret medicines are simply ready-made prescriptions prepared without secrecy or fraud. * * * Non-secret medicines do not in any way imitate or simulate patent medicines." They must be given credit in this instance for quoting us fairly, as the quotation is correct, and is the platform upon which we based our business when we originated and first offered non-secret medicines to the drug trade, and we are satisfied to have our preparations of this kind stand or fall on that platform, as our non-secrets are pharmaceutically prepared, without secrecy or fraud, and do not in any way imitate or simulate patent medicines.

So much for our side of the case. Now as to theirs. It is a well-known fact that they manufacture quite as full a line of non-secrets as we do; that they have pushed their sale wherever they have had an opportunity, and have sold their "scientific substitutes" for our original non-secret medicines wherever they could get a chance to put them in; therefore, the remainder of the article would simply be a reflex of the experience of those who have handled their goods. They further state, and they must be speaking from their own experience, that the non-secret traffic (which in this instance must be taken as their non-secret traffic) is "sustained by appropriating the advertising of the leading patent-medicine makers; by devising formulae which replace well-known patent nostrums ("scientific substitutes," undoubtedly,) by simulating labels, wrappers and packages as closely as the law and the patience of the victim will permit." We believe this last quotation to be strictly in accordance with their platform and their experience, for, as we have stated in the November number of the "New Idea," we have in our possession a line of such products as are put up by them, and we particularly referred to a comp. syrup of sarsaparilla, made by them in the style of Hood's, which as closely resembled Hood's as it was possible to make it without absolute infringement, which point was got around by twisting the large "Z" on the front panel so that the line "Sarsaparilla" runs downward from left to right, instead of upward from right to left, as it does on Hood's. There is no non-secret house in America, to our knowledge, which puts up an imitation of Hood's Sarsaparilla except Parke, Davis & Co.; therefore, the following quotation taken from their organ, "The Bulletin of Pharmacy," must refer to their own imitation: "An actual incident in the recent experi-

once of a correspondent furnishes forcible proof of the injury a druggist is most apt to inflict upon himself by an active interest in some non-secret substitute. Our correspondent, receiving a call for Hood's Sarsaparilla, handed out a bottle of the genuine preparation. The purchaser, after examining it very intently, with manifest surprise, paid the price, and handed the druggist a parcel which proved to contain a close non-secret imitation of Hood's article. "They tried to make me believe at a store up the street," he added, "that what I really wanted was no better than this, and I allowed myself to be persuaded by the man's assurance and paid for the bottle. After coming away, I felt utterly disgusted at having something forced on me in this way. I now have what I want. You can keep that stuff."

It seems rather curious that a house of any cleverness whatsoever would play with fire, or would make use of that favorite weapon of the Bushmen of Australia, known as the boomerang, which in the hands of those unskilled in its use, is likely to come back at the person who throws it with terrible force. That this article on "An Odious Traffic" will prove a boomerang for Parke, Davis & Co. is a certainty, as we have in our possession lines of their non-secret preparations, which are clearly imitations of patent medicines. They may have in their possession full lines of our products, which "do not in any way imitate or simulate patent medicines." The question then is, who is carrying on the "Odious Traffic." F. Stearns & Co., whose wrappers are original, and "do not imitate," or Parke, Davis & Co., whose wrappers are copied after patent nostrums, and do imitate them? There is no need of this would-be high and mighty self-appointed "ethical" concern, contending any longer that non-secret medicines are imitations, and that the manufacturers thereof are pirates and brigands, unless they take pleasure in calling themselves names, and their own products imitations, as the truth must prevail, and the facts are known and the proofs before us that they do manufacture non-secrets as largely as any house in existence, and furthermore their preparations are, we believe, the only real imitations of patent medicines offered by any non-secret manufacturing house. Therefore, if the non-secret traffic "works in the dark, uses the druggist as its cat-paw, appropriates, imitates, and filches from every quarter"—as they state it in their organ—they must assume their share of such wrong doing, as they are largely responsible for this outcome, and they still continue to "appropriate, imitate, and filch" by extending this line of their business.

We have been reliably informed that since it has been proven what hypocrites they are in condemning in others what they daily practice themselves, their general manager has issued letters of instruction to their traveling representatives not to offer or show any more "package goods," as they term their non-secrets. This, however, will not help their case in the least. Their former instructions were definite and full; their salesmen were posted, and their customers supplied with their non-secrets, all of which are in existence, and furnish sufficient proof to condemn them. The trouble has been that they blow hot and cold

with the same breath and have tried to ride too many horses at one time. They worked the "ethical" dodge with physicians about not trade marking preparations, to its fullest extent, at the same time on the quiet took out trade marks. They condemn patent medicines and nostrums as "the bane of the medical profession," and as "an injury to the public health," yet they devote a large portion of their laboratory to the manufacture of such, and use every effort in their correspondence department to the securing of orders for such. They state that they "hold strong convictions concerning the character of the non-secret business," yet have done everything in their power to increase their own business in this direction. In all three lines of work, the so-called "ethical," the nostrum, and the non-secret business they have practiced exactly opposite to what they preached. They have been found out, exposed, and published. This galls them, and for the reason of our having been the ones to expose their double dealings, they attempt to attack us on our non-secret business, overlooking the fact—if it is an odious traffic—that they are deeper in the mire themselves than could possibly be any house which avowedly makes non-secret medicines, for, even allowing for the sake of argument that the whole system is wrong (which it certainly is not if carried on according to our platform), still those who state in their catalogues that they do make these products are certainly at least honest and sincere, while those, such as Parke, Davis & Co., who state that they do not make such goods, but continue to do so, cannot but be considered as hypocrites.

A few words more. In the same number of their organ, "The Bulletin of Pharmacy," they attempt to ridicule our Wine of Cod Liver Oil. This might be expected of such a house, which had a special man engaged for three or four months trying to devise a "Scientific Substitute" for this very preparation, which is truly a fact. After having had a year's time to get out their "Scientific Substitute" for it, they give it up in despair. Had they been successful, the drug trade would have seen another instance of their "teaching these brigands a lesson," as they expressed it when they offered their half-strength Fluid Cascara Aromatic, as a "Scientific Substitute" for our original full-strength preparation. But as they were unable to duplicate our product, they are obliged to take another tack, and now come out with the statement that we "see in the conclusions of two speculative Frenchmen a chance to foist upon a suffering public a compound whose promises are so bright and whose taste is so pleasant." The "two speculative Frenchmen" referred to are Messrs. Gautier and Mourgues, who are universally known as two of the most advanced investigators in the field of organic chemistry in the world. Their work for the past five years has been mainly devoted to the study of the alkaloids and active principles of Cod Liver Oil, and for the last two years they have confined themselves exclusively to this subject. In addition to the above chemists M. J. Bouillon, one of the most prominent physicians of France; Lafage and Germain-See, two of the best practitioners, and most widely known writers on therapeutics in Paris, as well as many other eminent authorities have proved conclusively that Cod

Liver Oil does contain alkaloids and active principles, and that it is due to those alone that Cod Liver Oil is valuable. We would further state that we did not accept their statements without proving them, and months before our Wine of Cod Liver Oil was put upon the market, we placed it in the hands of the most eminent practitioners of Detroit, and furthermore had it tested clinically in all our large hospitals, such as Harper, St. Mary's and Grace. It was upon the flattering clinical reports that we received from Dr. E. L. Shurly, chief of staff of Harper Hospital, who is regarded by the medical profession of this country as a standard authority on laryngotomy and phthisis pulmonalis; David E. Inglis, recognized as one of our most noted neurologists; Oscar Le Seure, attending surgeon and gynaecologist of Grace Hospital, and many others, that we placed it in the hands of the profession generally. We did not jump at conclusions as did Parke, Davis & Co. in their appropriating the work of Dr. Hammond on Cerebrin without verifying his statements by clinical work of their own and therefore we have had no occasion to offer the medical profession so abject "An Apology" as they did, but we did have original clinical work done for us by the most eminent practitioners in noted hospitals; therefore, any attack upon our preparation by P. D. & Co. can only show their jealousy at our success and expose their own weakness. Had they brought out a preparation of such merit, and had they the result of such clinical experiments to back them up, the shoe would have been on the other foot. Where they cannot originate, they imitate; where they cannot imitate, they abuse.

Yours very truly,
FREDERICK STEARNS & CO.,
By F. K. STEARNS, President,
December 22, 1893.

UNIFORM PRICES FOR PHARMACEUTICALS.

At its recent meeting the N. W. D. A. passed a resolution and appointed a committee to consider the advisability of some action which would bring about a uniformity of prices on pharmaceutical products. The views of a few leading manufacturers are given below:

To the Editor;

We believe that the lists of the leading manufacturers of pharmaceutical products are practically uniform, differing chiefly in the matter of special products of their own individual manufacture.

We believe, also, that the discounts to the wholesale and retail trade from the list prices of the leading manufacturers are practically identical.

We appreciate the desirability, from the wholesalers' standpoint especially, of an even greater uniformity, both in list prices and discounts, than at present is in force. This could not be accomplished without the hearty co-operation of all manufacturers.

SHARP & DOHME,
New York.

To the Editor:

We desire to acknowledge the receipt of your letter extending to us the use of your columns in setting forth our views as to the feasibility of bringing manufacturing pharmacists together under a single standard as regards prices and relations of these manufacturers to

the jobbing and retail trade. We believe on account of the diversity of opinions among manufacturing pharmacists concerning the various policies that may be pursued in conducting their business, that it would be impossible for us to even faintly outline a plan that would be acceptable to all, or perhaps even to a few. We believe that the suggestion of the committee appointed by the N. W. D. A. to consider this subject, namely, that a meeting of all the manufacturers should be called with the committee at some time in the future, is the only one that will be productive of any positive results.

Judging from the unfriendly attitude that many manufacturing pharmacists evince toward each other, we fear that it is almost a hopeless task to look toward any co-operation. We believe, however, that the attempt should be made, and shall most assuredly strive to aid the committee to secure some favorable action.

THE SEARLE & HERETH CO.

Per F. S. Hereth, Vice-President,
Chicago.

To the Editor:

The following is a copy of a letter to the chairman of the committee, to whose charge this matter was confided:

We recognize the inconvenience to which the trade is put by the variations in prices and discounts of the different manufacturers of pharmaceutical products.

Whether a uniformity will benefit the different manufacturers is a mooted question.

Convenience in business is an object that should not be disregarded; and our house would probably agree to join all the others in the uniformity of catalogue prices.

These, however, would likely not remain uniform; for fluctuations in market prices would necessitate changes; and these changes might not easily or promptly be agreed upon.

As to entangling ourselves with any contracts or agreements: such an idea is entirely distasteful to us. Our observation of these in other business relations has too clearly demonstrated to our minds their folly. Such seem to benefit only the designing and unprincipled at the expense of the honest and conscientious.

Those agreements can be honestly maintained among a few houses who have absolute confidence in each other; but when a large number is involved the scheme, to our mind, is impracticable.

The disposition—which you deplore—on the part of manufacturers of pharmaceutical preparations to sell to whoever will buy, is one of the results of active competition. We cannot agree with you that such action induced or induces jobbers to manufacture their own line of pharmaceutical preparations; we think the motive altogether mercenary. Whether they have been disappointed in results, we cannot say; but we are persuaded that the manufacturers have studiously endeavored to protect the jobbing interests by not selling at the same prices to others who do not buy in equal quantities.

While we will be glad to assist your committee in smoothing the rough places; in making intercourse more

pleasant and easy to all concerned, we must decidedly decline to entangle ourselves with any alliance that might either violate our business morality or handicap us by the shortcomings of others.

Yours very respectfully,
HANCE BROTHERS & WHITE,
Philadelphia.

ALMOND OIL.

To the Editor:

I notice in the December 15 issue of your paper, page 543, an article similar to that which appeared in the December edition of the American Soap Journal, of Chicago, entitled "Almond Oil." I presume this article originally comes from a paper called "Oils, Colors and Dry Sulfurites," which, however, is unknown to me. As you doubtless know, I am probably the largest importer of this special article in this country, and I took exception to the article in the Soap Journal in a letter written the publisher, the substance of which is as follows:

Anybody who has had the least experience will see that it is written by somebody who has absolutely no knowledge at all of the article, and as it seems, also a very limited idea of chemistry. I will only mention a few points, as it would take too long to correct every mistake in it. In the first place, the fatty oil is pressed first, and the essential oil distilled afterwards. Furthermore the sweet almonds are always pressed peeled, while the bitter almonds are pressed unpeeled, for the simple reason that the bitter almonds are distilled after the expression, and the peel, therefore, does not change the essential oil, while the sweet almonds are powdered after the expression, for high grade face powders, and therefore must be white. I have not found sweet almond oil to be soluble in alcohol. I suppose you refer to the essential oil, which, however, you should state, as you speak of the sweet almond oil before. The most amusing, however, is that the writer mentions as adulterants, poppy oil, rape oil, sesame oil, peach oil, and apricot oil. The real adulterant, which is peanut oil, he does not mention at all, and what he means by keeping peach oil and apricot oil apart I do not understand. I believe he does not even know what these oils are. He means under both, peach kernel oil, or the expression in the trade is, almond oil persic. He gives seven tests for almond oil, and I may tell you I can give you a simple test for the genuine almond oil, in a few words, which will cover all and everything, and does not require such experimenting as he calls for.

Yours truly,
GEO. L'UEDERS.

New York, December 20.

WINDOW DRESSING.

To the Editor:

It is not through a matter of envy, jealousy or deception that I write to you these few lines, but when a brother druggist, as Mr. A. J. Embree, of Belton, Texas, discovers something new and runs four columns write-up in the Era to inform the world of this fact, as being his invention, I have a right to howl. I don't claim to be brighter or more of a genius than any one else, but assure you that his description is almost identically the same as if he had taken a photograph of my window during Easter

week for the last three years. The only difference that exists in the whole four columns write-up is that he has a fish pond and I have used a chicken yard. I will not accuse Mr. Embree of not having invented this new, attractive window, but I do accuse him of having exactly my ideas, except he is greater on getting diploma and write-ups and being three years behind the times. I refer for the truthfulness of the statement that my window was just exactly the same as he described, last spring, in the spring of 1892, and also in the spring of 1891, to the First National Bank, Oklahoma National Bank, Oklahoma City Bank, Daily Journal, and Preachers' Nicos, Cross or Francis.

Yours truly,

J. WAND.
Oklahoma City, Ok.

WHAT THE DRUGGIST DOES NOT KNOW.

Here is a little contribution which emphasizes the fact that there are some druggists who are not thoroughly posted in the proper use of the English language. It is presented to serve as a terrible warning to the careless. It might be said in explanation that this plaint comes from a druggist in Indiana, a state which is not favored with a pharmacy law.

"I wish the medicine traid to take steps to prohibit other merschants from selling drugs as they are inguring the Drug traid bu Cutting on drugs we have dry goods merschants in our town that are gust Comensed that game so you will please notify other whole sal houses that the drugist must be in a uniom or the traid will perish I have handjed medicines for thirty years and do not want to see our traid fall I am a frm man in my ways if a man should rather die than to pay the price of medicine when he is able I just have the snap to let him die for such men are a neunance to Comunity
this from your friend"

U. T. A. LABEL.

To the Editor:

In your issue of November 1st you call attention to a plan to prevent cutting, managed by a corporation in Detroit, called the Universal Trade Association. Since reading your article, I have closely examined the plan or system of the association, and I think it thorough, effective and businesslike. It is manifest that the complete success of the plan in eradicating the great evil of cutting lies with the retail druggists themselves. If they all, or even a majority of them, join the association, they will effectually combine for mutual protection. The association provides the means and it is for the retail trade to adopt them, and cutting will be relegated to the things of the past. Let retailers show a bold and solid front to protect their business interests from the Inroads of the rapacious and nefarious cutter. The plan of the U. T. A. has my unqualified and cordial support and approval. It seems curious that so simple and efficacious a method of putting an end to cutting was not thought of before this. I wish the U. T. A. the enduring success its methods deserve.

Yours truly,
N. A. GOODWIN, M. D.
Detroit.

PERCENTAGE SOLUTIONS.

I send you here with a simple rule formulated into words for making the lately much used percentage solutions. It will stand the test of exact mathematical examination, and has been very much used by druggists in this city for years. It runs thus: Multiply the weight (in grains) of a dram of water, by the number of drams desired, multiply this product by the percentage desired. Dividing all this by 100 gives the percentage. The result will be the number of grains to be added to the quantity of solution desired. For easy memorizing, the rule may be run off thus: Multiply the weight of a dram by the number of drams and this by the percentage. Divide by 100 for percentage. Every one who uses this rule is struck by its simplicity, facility, compactness, and exactness. It will be useful, I am confident, to doctors, druggists, and students alike.

pleas to Send me Sanethug to kept these worms fonne camng oup in My Mouth I never was truble with theame be for in my lift.

Please send me one vile Paregoric for my baby he is sick charge to me

hastely
Sept 2.

Please send me 5 cts worth of phnas-teen.

10 grains of zlnk.
10 grains sugar lead.
In 2 ounces of werter.

I send 5cts. by the Girl Please send me worth in Epsom Saults And oblige

Please sir send me something to take I have a verry bad pain in my stomic the pain is from my nable and every time I make water it all most cut me in two I saw a little blood in the water and the small part of my back hurt me two Pleas let me know what my bill is

please fill this perscription from Dr. Smith that you did Last for the irry-riplus for my mother and oblige

Please send me 20 grains of powderd quinlne.

Please send me 10 cts of Parregoric.

Please send me a Bottle of Mrs Winsloes soothing syrup.

You will send me
25 grains of sugur lead
25 grains of white viturl
1 oz of rose water
& 5 cits worth of ladnum diox mix It
25 Cts is what I hav ben baying for It yours truly

Please let Jacob Brown have what mederson prescribe for his wife.

Please send me one vile of castroil and 5 cts. worth of ammonia charge to me and oblige

One vile balsam of copabia 10
" " parigoric 10
" sweet spirits nitre 10

Dear Mrs. Pergerson

I intended to come over to night to see how the baby is but the weather is

so threatening I will write if the baby is no better give 1/4gr of Calomel and 1/2 gr of dover Powder give ever four hours untill you give four Powders I hope the baby is better your friend

M. C. G.

Mr. Koelnig I send this note to you Mrs Gilliland wrote to me night befor last about my baby she has been to see him. he has been sick ever since I was up there and does not seem to get much better his passages are green this A. M. and so much water in them but he has not had as many yesterday and last night as he did before you can send if you think he needs it will not do him any harm if it does not any good they have been very bad ever since I was there I send my calamon vile take yours out of it he is lively but has fallen off so much I think it is his teeth if you dont think he needs it send me word but I guess Mr. G— knows best he is sick at the stomach and heaves often does not heave anything charge to me and oblige

send me 5 cts worth of blue mass for my liver is all out of order, the baby is 6 1/2 months old—

F. W. KOENIG.

The British Columbia Pharmaceutical Association, at a meeting held in Nanaimo, decided to join with the eastern associations in forming a Dominion Pharmaceutical Society, and to have a Canadian Pharmacopoeia. The association also resolved that the provisions of the pharmacy act should be strictly enforced throughout the province.

John Martin and attorney J. D. Laws have gotten into trouble in Des Moines for attempted blackmail upon druggists. Their methods were to begin injunction proceedings against druggists who were suspected of selling liquor illegally, and later to make arrangements with the individuals whereby proceedings would be dropped. Their methods did not meet with the approval of the grand jury.

Four sisters in New South Wales, aged respectively 18, 9, 5 and 3 years, are reported by the Chemist and Druggist to have been seriously poisoned through inadvertently swallowing some antiseptic tablets of perchloride of mercury, prepared by Parke, Davis & Co., of Detroit. The tablets were packed in a colored bottle and had apparently been mistaken for sweets by the girls. The directions on the bottle were that for a solution of 1-1000, one tablet was sufficient for five ounces of water, it being seen that each tablet contains about 2 1/2 grains of corrosive sublimate. The younger children took twenty times, and the eldest sixty times the maximum adult dose. None of the sufferers were seen until several hours after taking the poison, but through the very energetic work of the physicians the lives of all were saved. (This incident only serves to emphasize the necessity for manufacturers, and druggists as well, labeling articles of a poisonous nature sold or passed out to the public by them, in a distinctive and specific manner. In view of the general lax observance of poison laws, and the indiscriminate sale of poisons to the public, the deadly nature of poisonous substances like this one should be made so plain and emphatic that "he who runs may read."—Ed.).

LONDON LETTER.

The present year has now not very much longer to run, and all are doing their best to swell the receipts for the remaining period so as to make the year's sales as heavy as possible, before a new folio is commenced under the yet unfamiliar heading of "1884." It seems almost incredible that we are on the verge of another year, as on looking back over the matters which have been accomplished during 1883, there does not appear to be an adequate amount of results, for the corresponding trouble which has been taken by many to better their positions. However, there is some, although not much, consolation in the saying that things might have been much worse.

At this time of writing there is a considerable amount of commerce going on, and the hope is that the briskness will run on into the coming year, and thus inaugurate the new year with some encouragement to those who engage in commerce.

In addition to better trade during the past four weeks, there has been much outside talk which has been of great interest to the drug fraternity, and if things turn out as they appear to be tending, the atmosphere will be greatly purified, and some of those disgusting nostrums removed from the face, not of the earth, but from the druggists' counters, where they have found room, much against the proprietors' desires; but one cannot get one's own way even in these things, where fraud is stamped on the article itself.

The government has been aroused to the fact that the public are being victimized by the unscrupulous dealers in patent medicines who pain off the so-called remedies for certain diseases knowing that nothing but disappointment can ensue, and it is earnestly to be hoped that there will be a stampede of those abominations, which serve to destroy the druggist's trade in legitimate articles of his own manufacture.

The electric belt business alluded to last month has been placed in the hands of the public receiver, and the manager has appeared before the metropolitan magistrates several times on adjournments for his making and vending goods which are alleged to be worthless for the purposes for which they are recommended. The commendable action of the public prosecutor has been followed in an unexpected manner by many who trade on the credulity of the masses shutting up their places of deception and decamping, although the smallness of their operations would have kept them clear of the minions of the law. In the shape of gentlemen clad in the orthodox blue habiliments, armed with a warrant for the arrest of the delinquents. Some of the proprietary medicine people have had a consultation as to what should be done, as there can be no doubt that the result of the electric belt trial will have some effect on this department of money-making—it cannot be called business. The opinion of an eminent Q. C. (queen's counsel a legal dignitary high up in the legal profession) who has been consulted from time to time in causes involving proprietary rights as to trade-marks in connection with those remedies alluded to, states that the lot, in the future, of those engaged in this traffic is by no means an enviable one. The subject has been dis-

cussed from time to time by many uninterested people, and as a neutral opinion in this kind of matter is of great value, it would seem that the vast majority of the educated classes are looking for some legislation that will successfully cope with the very shocking results which in many cases follow the regular use of the remedies which are supposed to be a panacea for all the ills of this mortal life. The actions of the powers that be have been tardy, but there may be the excuse of ignorance on the subject, for even reputable medical men have been hoodwinked into bestowing testimonials on the same goods which are now being run down. How the medical men in question could have become a party to influencing the sale of any article which is built up on the methods of degrading the ability of the medical profession, is, to say the least of it, inexplicable; but there can be little doubt that some sort of underhand ruse must have been brought into requisition to effect the purpose of the advertisers.

As indicated at the commencement of this letter, business is, all round, in a better condition than it has been for several weeks, and after all the holiday season will not be without its stress of patrons. Better late than never is a time-honored adage, and while modern merchant adventurers prefer to have the good times forever with them, they have sufficient good sense to admit that it is as well to submit to the inevitable. This season the people have been longer than usual in making their Christmas purchases, but so far the amount the respective persons are spending seems to be not less than previous years, and of one thing there is no doubt, they will get better value for their money this season than ever they got before. The choice of goods at small prices is exceptionally large and unique, and there can be no excuse for any one refraining from giving a present on account of expense or want of articles to select from, as there are articles which cannot but please every variety of taste.

The large stores in the great towns bring to bear at this time of the year a system of advertising in the papers of the small towns, with the object of getting hold of the mail order trade, but this year they do not seem to be in any better position to do this advantageously than the local druggists themselves. This shows that the local men, having foreseen the tactics of the large people, they framed their prices to compete, and it also shows that they must have bought on a larger scale than hitherto to enable them to get the bottom prices; it is highly improbable that they would sell at a loss, even for the sake of gaining publicity, as the drug trade is not one in which you can throw away very much in the hope of bringing in greater returns. This certainly has the desired effect in many classes of business, but then these cannot be regarded as depending on their merits; the drug trade can be truthfully said to be the most steady-going business there is in existence.

The local advertising by the local druggists is, this year, deserving of praise, and the wish is that it will bring in what is most desired—a godly share of the currency, which at this season of the year does not usually belle its name by remaining in one person's hands, but which, as a rule, circulates pretty freely,

and thereby gives most people a chance to get hold of a little of the very useful commodity.

The happy hunting ground of the servants of the Pharmaceutical Society during the last few weeks has been the rural districts of Scotland, where many convictions have been obtained. It is to be feared that the society are not discriminating freely enough as to cases to take up, but as a matter of fact, they are doing only what is right in bringing every contravention of the various acts before the proper authorities. But the odium of a prosecution very often attaches to the local druggist, and accordingly he suffers, as the public sympathy goes with the person who seems to be injured. The following cutting from a Scottish paper will show how these matters are taken:

"Four cases under the pharmacy acts of 1852 and 1868 were disposed of in the sheriff court, Linnthgow, to-day. Fines of one shilling, with one pound expenses were imposed on a grocer and an ironmonger for selling sheep-dip containing arsenic. It seemed a pity, said the sheriff, that prosecutions of this kind were intrusted to a society which did not do its duty, because it was a notorious fact that these poisons had been sold openly by grocers, and no action taken until suddenly the society made a jump upon them."

At the same court a druggist's unqualified assistant was fined £2s for selling two quantities of poison to the secretary of the North British branch of the Pharmaceutical Society. A grocer was charged with selling a bottle of chlorodyne, but was discharged. From these four cases it would appear to all sensible people that the society in question made no distinction between any trade so long as they were found to be infringing the laws governing the respective sales.

A spirit has taken place in both the wholesale and manufacturing departments of the drug business, and orders are coming in pretty freely from all sources. The staple goods are, of course, occupying the greater part of attention, as the weather, as usual, is rendering it necessary for large numbers of the populace to have recourse to the many cough preparations, according to their choice, and these are productive of much profit to the retailer. The latter, as a rule, finds it more beneficial to buy these remedies ready made from the manufacturing druggists, as the demand is large, and the latter having all the proper facilities for their speedy and effectual manufacture, a better article is obtained, and the price is not out of the way.

The sales at auction are beginning to be less frequented, and the reasons are the same as in former times, the principal one being, the principals are occupied the most of the time at their respective offices in superintending their Christmas trade, which requires a good deal of looking after, so as to give satisfaction to their patrons, who are inclined to be fastidious at this particular season of the year.

The Governor of Georgia has signed an amendment to the pharmacy law which restores the old fee and does away with the annual renewal fees. Renewal fees were burdensome, and fully 85 per cent of the druggists in that state favored the amendment.

WILLIAM R. WARNER & COMPANY

The founder and present head of this pharmaceutical manufacturing house of Philadelphia, is William R. Warner, and it is to his efforts in raising the manufacture of medicines to the highest degree of mechanical and scientific perfection, coupled with peculiar executive talent, that its great success has been due. Mr. Warner was born in Maryland in 1836, of parents of notable ancestry, through both his father and mother tracing relationship from well known English families, and close connection with prominent figures in the early history of this country. He received his education at a country school, later attending the Easton Academy, Maryland, but he soon found it necessary to labor for his support and entered on the duties of drug store apprentice in Easton. His spare time was devoted to study, particularly natural history and science, and studies of this character have been his pleasure through-

out his life. He graduated from the Philadelphia College of Pharmacy in 1856, and then followed the retail drug business in Philadelphia for some years, keeping up active connection with the college and local professional associations. In 1866 he engaged in the wholesale drug business at 154 North Third street, ten years later removing to 1228 Market street. These premises still serve for offices and sales-rooms, but the manufacturing branch had grown to such proportions that, a few years ago, a handsome seven story building was erected on Wallace street for its accommodation.

Mr. Warner has had as his associate for a number of years, his eldest son, William R. Warner, Jr., whose experience and training in his father's business have been of a character to make him an efficient and valuable aide.

The house of William R. Warner & Co.

started from small beginnings, but is now one of the most enterprising and largest manufacturers of pharmaceutical products in America. It was a pioneer in the manufacture of sugar-coated pills and various other standard preparations, and has won a leading position through the skill and care exerted in its manufacturing processes, the reliability of its products and successful management.

The house manufactures all the standard lines of pharmaceuticals and a number of well known specialties. Agencies are maintained in London and Australia, and its manufactures are to be found throughout the world. Its exhibits at various world's fairs have secured many awards for excellence, and the beauty of its products invariably elicits attention and admiration. It enjoys to a marked degree the confidence of physicians and the drug trade.

TRADE COMMENT.

W. C. Bell, for the past year manager of the Era's New York office, will hereafter represent Solon Palmer as traveling salesman in Michigan, Wisconsin and Minnesota. Mr. Bell carries with him the best wishes of the Era for success in his new position.

Asbestos soap is one of the latest candidates for the favor of the unwashed.

The greatest events of an age are its best thought. It is the nature of thought to find its way into action.

Ten thousand pounds of ginseng were recently lost by the wreck of a vessel bound from the United States to China.

There are over 60,000 coconut trees in Florida and their fruit is nearly all sent to the New York market.

The town of Kuttawa, Kentucky, as might be expected, boasts of an advertising cut-rate drug firm.

Formerly, when great fortunes were only made in war, war was a business; but now, when great fortunes are only made by business, business is war.

A recent shipment of crude camphor received at the refinery at Rumney, N. H., was found to be largely adulterated with common salt.

The stock of gum tragacanth held in warehouse in London on December 1st, was nearly twice as large as at the same time last year.

During the year ending June 30, 1893, the imports of cocoa were 24,460,330 pounds, the exports were 1,483,167 pounds, showing a home consumption of 22,972,158 pounds.

The average value of imported cork wood for the five years preceding 1893 was \$991,745. During nine months of 1893 the valuation reached \$1,360,250, a decided increase over any previous year.

Recent experiments by navigators have demonstrated that soap suds is just as effectual in calming violent waves during a storm as oil and its cheapness is quite an argument in favor of its use.

The Hot Springs city council has adopted an ordinance that drummers who solicit patronage for local physicians must hereafter wear a numbered tag in accordance with the law.

It is reported that a lot of 7,500 pounds of Angostura Tonka beans which have been in the hands of a New York importer for several months are to be shipped to Hamburg.

California has entered the China trade with quicksilver. A shipment of 1,000 flasks worth \$40 per flask was made from San Francisco to Hong Kong recently. This territory has heretofore been supplied by English dealers.

The shipments of castle soap (Conti's) from Leghorn to the United States during November last were 3,300 boxes, the shipments for the same month last year being 6,120 boxes. The total shipments for 11 months of 1893 amounted to 33,035 boxes, against 48,635 boxes during same period of 1892.

Customs duties for the five months ending November 30 show a decrease of \$25,000,000 as compared with a corresponding period of 1892. During the month of November, 1893, the collections amounted to a little over \$10,000,000 compared with \$17,000,000 for November, 1892.

The coin controlled or nickel-in-the-shot machine for the distribution of perfumes is, according to La Nature, receiving considerable attention in Paris, and the municipal council is studying the propriety of employing these machines for the distribution of disinfectants and antiseptics.

"A pharmaceutical chemist with excellent testimonials, will give his services for board, residence and clothes," is the way an advertisement reads in a recent issue of a Sydney, Australia, paper. The reports which have reached us as to depression in trade during the last year in Australia must be authentic.

Of the many things which are included among the accoutrements of the bicycle rider the latest is the "Kl-y-l," an apparatus somewhat similar to a bulb syringe, which is filled with dilute aqua ammonia. It is used as a means of teaching the bicycle chasing dog to remain in his kennel while there are any wheelmen in his neighborhood.

The west coast of Africa produces an enormous crop of peanuts, Marcellites alone using 10,000,000 bushels a year, while many other millions of bushels go to London, Berlin and other markets. This product is largely used in the manufacture of chocolate (?) and of peanut oil. Very large quantities are grown in India and Brazil, but find principally a home market.

The sympathy of the people of the United States can now be extended to the unfortunate people of West Australia who are now experiencing trouble with their tariff. A bill is under consideration which raises the duty on nearly all goods handled by druggists. Even scientific instruments which are now free will have to pay 10 per cent under the new bill.

An indorser of a note should remember that he is held for the payment of the amount in full, principal and interest. If the maker of the note, through misfortune, mismanagement, or rascality, fails to pay it. The indorser assumes all this responsibility, with no voice in the management in the business and no share in the profits of the maker's transactions, if they prove profitable.

An advertiser must be a student of human nature and human needs, says Chas. Austin Bates in Printers' Ink. He must think out all the things which make his goods desirable, and then use one point at a time and shoot straight at the mark. If he uses all his points in one shot they will scatter too much. You can hit more birds with a shotgun than with a rifle, but may be not hard enough to hurt. Those you hit with a rifle ball you carry home in your bag.

"A full line of dry goods" appeals to the needs of a great many people; "12½c gingham at 8c" strikes comparatively few, but it is more effective. If a medicine will cure corns and headache and consumption, better give it to people in three doses.

CHEMICAL INDUSTRY OF THE UNITED STATES.

As our present social and financial conditions furnish strong incentives for the study of political economy and questions affecting our prosperity, we publish below some statistics obtained from the Bureau having in charge the work of the eleventh census. These figures are of a character which justifies a certain amount of national self-gratulation and they furnish much food for reflection, and may incidentally furnish ammunition to those who feel combative whenever the subjects of labor and capital are mentioned.

Number of establishments (a).....	1,656
Capital.....	\$168,462,914
Average number of employes (b).....	43,701
Total wages.....	\$ 25,321,077
Total officers and clerks.....	5,353
Total officers and clerks' wages.....	7,464,390
All other employes.....	37,348
All other employes' wages.....	17,856,811
Cost of materials used.....	106,522,980
Total value of products.....	\$177,811,822
(a.) This statement includes in addition to the manufacture of chemicals proper, the manufacture of paints, varnish, fertilizers, dye stuffs and extracts; celluloid; high explosives; gun powder; honp, ivory and lamp black; oil, resin; and oil, essential.	
(b.) This is a general average for all classes of employes, including officers, firm members and clerks.	

THE UNITED STATES CAPSULE COMPANY.

For the past two or three months the trade has been full of rumors in regard to a combination of manufacturers of empty capsules, and on December 1, 1893, there were filed at Trenton, N. J., articles of incorporation of the United States Capsule Co. The incorporators are Lincoln B. Palmer, of Newark, N. J., Robert H. McCutcheon, of New York City, and Walter Barnes, of Brooklyn, N. Y. Total capital stock \$70,000, in 700 shares of \$100 each. Capital paid in to commence \$1,000, subscribed equally by the incorporators. The corporation to continue for fifty years, to manufacture and deal in capsules, pills and patent medicines.

As is often the case, the figures and names of incorporators above are evidently intended for preliminary purposes only, as reports which have been filed now show that the Merz Capsule Company, the Warren Capsule Company, and the Michigan Capsule Company, of Detroit, and the National Capsule Co., of Indianapolis, have all assigned their business to the United States Capsule Co. We are advised that the headquarters of the company will be in Detroit, and that the permanent organization and election of officers will take place early in January.

These manufacturers claim that this combination was necessary to prevent ruinous competition. Prices had been reduced to \$5.00, and in some cases to \$4.50 per gross, which they state is below the actual cost of production. Prices have now been advanced by these manufacturers to \$8.00 and upwards per gross, according to the quantity and brand. As will be noticed from the above, H. Planter & Son and Dundas Dick & Co., of New York; the Hall Capsule Co., of Cincinnati, and F. A. Hubel, of Detroit (the latter makes the "F. D. & Co." brand of capsules), are not members of this new organization.

Among the articles sought to be taxed through amended tariff laws in New Zealand, is saccharine, which is to bear a duty of "1-2d per pound as sugar." Experts claim that this rate of duty will probably yield the colony a revenue of one or two shillings per year.

WORKS OF THE HERF & FRERICHS CHEMICAL CO., ST. LOUIS, MO., 1887 and 1903.

The above cut illustrates the remarkable growth of the works of the Herf & Frerichs Chemical Co., St. Louis, Mo., who, in the short space of seven years, have succeeded in building up from a modest beginning a manufacturing establishment which now ranks among the foremost of its kind in the United States. In the early part of 1887 they commenced building on a piece of property of 12 acres, situated in the southern part of the city on the Iron Mountain Railroad and fronting the Mississippi River. The place appeared eminently adapted for the location of chemical works, a side track connecting them with the railroad, and the river giving them facilities for unloading, right at the factory, barges with raw materials from abroad and affording at the same time an abundant and cheap supply of water for the works. The original two-story factory building had a frontage of 100 feet and a depth of 80 feet, and one boiler of 80-horse power supplied the steam; in the fall of 1887 the plant was in operation and at the beginning of 1888 it had produced a sufficient stock of goods to permit the firm entering the market. Since that time the works have been steadily increased and now, six years later, they have grown to the dimensions shown in the cut.

From a small two-story building the works have developed into a manufacturing establishment of 800 feet in length and an average depth of 200 feet, covering, on both sides of the railroad and along the river bank, an area equivalent

to two large city blocks. Six boilers, of an aggregate capacity of 500 horse-power, supply the steam; electric light and gas are produced on the premises, their water works furnish 16,000 gallons river water per hour, and a further supply is derived from the city mains. An engine of 50 horse-power provides the power and transmits it by one continuous line shaft of 400 feet throughout the entire works and from this main line other shafts branch off, making the total length of the shaftings used in the establishment nearly 1,000 feet. A system of steam pipes leads steam from the boilers to all parts of the works, and a system of pipes for river, city and distilled water gives an ample supply of water wherever it is required. The firm have their own machine and carpenter shops and employ permanently a staff of machinists, blacksmiths, pipe fitters, copper-smiths, carpenters, lead burners and other mechanics, with whose assistance they build or finish most of their apparatus and keep the entire plant in the best state of repair. By endeavoring to have the largest part of their manufacturing work done by the most complete machinery which can be devised, the seventy skilled men who are now employed in their establishment are enabled to produce a more uniformly excellent quality and a far larger quantity of chemicals than would be possible without the help of such perfect apparatus. Their facilities for the manufacture of salicylic acid and acetanilid are unsurpassed, and their ammonia works

are among the largest in the country. Their arrangements for the manufacture of sulphuric ethers of a uniformly high standard have been so successful that it would be difficult to improve on them. Experienced chemists and engineers are in charge of the various departments of the works, and in view of the progressive spirit which has characterized everything this firm have done, it is safe to say that they are now better than ever prepared to supply their friends to the best advantage and will continue to develop their business as energetically as they evidently have done hitherto.

One of the points to which small dealers in wallpaper pay too little attention, remarks Interior Decorator, is the art of making the interiors of their stores something more than a mere convenient means for selling goods. Some of the most successful handlers of wallpaper, who are brought into direct touch with the public, have attributed no small part of their increased sales to attention to the wall hangings and decorations of their own stores. This gives the purchaser a feeling of respect for the class of goods he is about to examine, and conveys as well some idea of how those materials appear in use which he will otherwise see only in the sample. If good taste and judgment have been displayed in carrying out the decoration, they will afford a capital advertisement of the capacity of the establishment to repeat the success elsewhere.

ADVERTISING CUTTERS.

The Committee on Proprietary Goods of the N. W. D. A. has issued the list given below during the interval which must elapse before completion of the list of dealers from whom proprietors can accept orders at a discount (as provided in the Detroit Plan), this list of cutters will serve for guidance.

Albany, N. Y.—Brad's Drug Store (S. C. Bradt & Son), L. H. Gann, John G. Myers, Wm. Sautter, Wm. M. Whitney & Co., Charles H. Wiberley.

Allentown, Pa.—American Medicine Co. (Edwold T. Pragle, manager).

Altoona, Pa.—Baltzell Bros.

Amazonia, Mo.—M. Scudder & Co.

Angel's Camp, Cal.—J. H. Condy, Mrs. J. S. Crawford.

Asbury Park, N. J.—Williams' Pharmacy, 159-161 Main Street.

Astoria, Ore.—Parker & Hanson.

Atlanta, Ga.—D. S. Goldsmith & Co., Jacobs' Pharmacy (Jos. Jacobs). This concern has recently ordered under name of D. S. Goldsmith & Co.

Atlantic City, N. J.—C. D. Johnson & Co. (The People's Drug Store).

Attala, Ala.—P. L. Walker.

Aubrey, Tex.—Dr. E. M. Bates.

Augusta, Ga.—Stothart, McMillan & Co.

Aurora, Ind.—W. B. McCreary (or George McCreary).

Baltimore, Md.—Herb Medical Co. (J. S. Hopkins), J. S. Hopkins (Herb Med. Co.), Geo. Johnson & Co., 430 S. Broadway, F. C. Jones, 100 N. Gilmore, J. F. Nydegger (supplies Wm. H. Read), Bertier McClure, F. J. Grote, Posner Bros., 215-219 W. Lexington Street, Wm. H. Read.

Beaver Crossing, Neb.—DeWitt Enger.

Big Rapids, Mich.—F. Fairman.

Bonnleville, Ky.—Stamp & Co.

Boston, Mass.—Houghton & Dutton (see Colorado Springs, Col., Dutton & Co.), C. P. Jaynes & Co., E. F. Jaynes & Co., H. A. Jaynes & Co., J. W. F. Wilson, Jr., C. E. Woodward, H. E. Woodward, W. H. Zinn.

Bozeman, Mont.—R. F. May.

Broadheadsville, Pa.—Steward Lawfer.

Brooklyn, N. Y.—Bolton Drug Co., Brooklyn Drug Co., C. J. Hazzard, Myrtle Ave., Cor. Classon Ave., B. H. Livingston (Livingston's Drug Store), 231 Grand Street; Maas's Pharmacy.

Brownville, Neb.—A. A. McIninch & Son.

Burlington (West), Ia.—Wm. H. Gahegan & Son.

Buffalo, N. Y.—Faxon, Williams & Faxon (see Lockport, N. Y.).

Calais, Me.—C. E. McIninch.

Camden, Tenn.—McDaniel & Hall.

Carrollton, Ga.—M. P. Watkins.

Centerville, Cal.—J. Magnin (grocer).

Charleston, S. C.—E. A. Hall, Palmetto Pharmacy Co.

Chester, Pa.—J. E. Smith, manager Dr. J. P. Miller's Store.

Chicago, Ill.—A. A. Arend, Bee Hive, Boston Store, Partridge & Netcher (see Kansas City, Mo.), Geo. Catlin (purchases for "The Fair"), Chicago Drug Exchange, H. R. Eagle & Co., Economical Drug Co., C. H. McConnell, President, Oscar M. Zesch, Secretary, James M. Stimpson, Treasurer, Flsh, Joseph & Co., M. D. Madigan & Co., 470-472 Ordan Avenue; C. H. McConnell (President Economical Drug Co.), Paris Store, P. T. Ryan & Co., Schlesinger & Mayer, Siegel, Cooper & Co., Jas. M. Stimpson (Treasurer Economical Drug Co.), The Fair (buy goods also in name of Geo. Catlin), The Lead-

er, J. H. Walker & Co., Oscar M. Zesch (Secretary Economical Drug Co.).

Cincinnati, O.—Allen & Co., A. L. Hochmer, City Hall Pharmacy (A. L. Hochmer), Jno. Darragh, Jr., Richmond St. and Central Ave.; W. J. Dawe, M. C. Dow, (said to purchase for Jno. D. Park & Sons Co.), Miss M. C. Dow, 552 W. 5th St.; 282 Race St.; H. Gradel, Hemphill Bros., of Hising Sun, Ind. (Said to purchase goods for A. O. Zwick), E. A. Keeshan, John Keeshan, Koch & Co., Koehler, Allen & Co. (Also Allen & Co.), Jno. C. McCullough, of Lawrenceburgh, Ind. (Said to purchase goods for Jno. D. Park & Sons Co.), John D. Park & Sons Co., A. O. Zwick.

Clarksville, Tenn.—Clarksville Drug Co. (T. A. Thomas, Manager), T. A. Thomas Drug Co.

Clearfield, Pa.—Dr. D. H. Sweeney.

Cleveland, O.—The H. M. Brown Co., Crow & Whitmarsh.

Clinton, Wis.—Church's One-Price Cash Store (H. G. Church).

Cohoes, N. Y.—J. S. Calkins.

Colorado Springs, Col.—Frank Dutton & Co. (See Houghton & Dutton, Boston), Coldwater, Ks.—J. E. Sombart.

Conneaut, O.—E. A. Black (Grocer).

Concordia, Ks.—B. H. McCleekron & Son.

Cynthiana, Ind.—J. L. Blase.

Dayton, O.—James Abbey (Said to supply Jno. D. Park & Sons Co.).

Decatur, Ill.—Harry K. Midkiff (Assignee Ralph Templeton).

Danville, Ill.—New York Store, 23 W. Main Street.

Denison, Tex.—T. Liebrecht, 312 Main Street.

Denver, Col.—The Fair (C. Monash).

Derby Line, Vt.—Flint's New Drug Store (J. T. Flint).

Des Arc, Ark.—J. A. Pettey.

Detroit, Mich.—Brown's Pharmacy Co. (W. J. Brown, Manager), Cut-Rate Patent Medicine Store, 16 Park Place (Dr. H. H. Carnes or Mrs. Carnes, Prop.), C. H. Michell (Grocer), Chas. Moorland & Son.

Diamondale, Mich.—F. A. Merritt.

East Greenwich, R. I.—Green's Prescription Drug Store (also Providence, R. I.).

East Los Angeles, Cal.—J. R. Brossart's Cash Store.

East Worcester, N. Y.—W. Sautter, 8 N. Pearl St., Twiddle Building.

Easton, Pa.—W. T. Wiley, Manager Dr. J. P. Miller's Store.

Eau Claire, Wis.—Cass Drug Co.

Elgin, Ill.—Theo. F. Swan (Springer).

Elkhart, Ind.—Beckley's Pharmacy.

Erie, Pa.—Trask, Prescott & Richardson.

Esparito, Cal.—Levy & Schwab.

Eureka, Cal.—Geo. R. Knott.

Fall River, Mass.—Jno. M. Deane.

Flint, Mich.—C. B. Flanders & Son.

Florence, Tex.—Hobbs & Miller.

Fremont, Neb.—W. J. Davies.

Fresno, Cal.—Dr. J. H. Bassin, Elinsteln & Co., Kutner, Goldstein & Co.

Galesburg, Ill.—Dr. John Kemper.

Gaylord, Minn.—Boreen Swan.

Geneva, N. Y.—Barkman & Meyers, Corner Drug Store.

Girard, Ks.—L. H. Cushmanberry & Co.

Goldsboro, N. C.—W. H. Finlayson, J. H. Powell, Spicer's Drug Store (J. D. Spicer).

Gonzales, Tex.—Harnden Bros.

Grand Rapids, Mich.—Morse's Department Store.

Greenfield, Mass.—Geo. Hunter, School Street.

Grover, Pa.—S. S. Vermilya.

Hallowell, Me.—C. H. Brann, Henry D. Clearwater.

Hampton C. H., S. C.—J. S. Dewitt.

Harrisburg, Pa.—M. J. Eckard (buys for Kennedy), F. K. Hensel (purchases goods for W. H. Kennedy), W. H. Kennedy (purchases goods in name of F. K. Hensel), J. D. Shields & Co. (buy for Kennedy).

Hartford, Conn.—Brown, Thompson & Co. (see "Scotch Syndicate," N. Y.), Hartford Drug Co.

Hudson, Mich.—H. C. Hall.

Hyannis, Neb.—John P. Sibbitt (Hotel and Saloon).

Iilon, N. Y.—Seward Merry, Agent, Otsego Street.

Indianapolis, Ind.—Julius D. Pearson.

Jacksonville, Fla.—W. A. Dell.

Kansas City, Mo.—Bullene, Moore, Emery & Co., Partridge & Netcher, 1109-1111 Main Street (see "Isoton Store," Chicago).

Kuttawa, Ky.—Hargan & Son.

Lancaster, Pa.—Jno. Black (said to purchase for cutters), J. C. Houghton & Co., 20 and 22 West King St.; Samuel E. Grabbill, Duke and Vine Streets.

Lawrence, Mass.—W. Oswald & Co.

Lawrenceburgh, Ind.—Jno. C. McCullough (said to purchase goods for Jno. D. Park & Sons Co., Cincinnati).

Lockport, N. Y.—Yerxa's (Faxon, Williams & Faxon) (see Buffalo).

Los Angeles, Cal.—J. R. Brossart's Cash Store, East Los Angeles; W. E. Chamberlain, The Angel City Chemical Co., The Hamburger Co.

Mt. Vernon, Ill.—C. D. Cook.

Madison, Cal.—A. Harris.

Marion, Ind.—L. J. Sterrett & Co.

Manistee, Mich.—H. B. Larsen (Department Store).

Mason City, Ill.—Porter & Porter.

Millville, N. J.—J. Kirkle.

Millwaukee, Wis.—Frank A. Lappen & Co.

Minneapolis, Minn.—Dickinson's Bazaar, Donaldson's Glass Block (Wm. Donaldson & Co.), Minneapolis Dry Goods Co., S. E. Olson & Co.

Madison, Cal.—A. Harris.

Madison, Wis.—The People's Bread Co. (Alex. Findlay, Manager), 201-203 King Street.

Memphis, Tenn.—A. G. Brown, Jas. S. Robinson, Masonic Temple; J. C. Stevenson, Titcomb & McCain (J. E. Stevenson, successor).

Meriden, Conn.—M. W. Sherwood & Co.

Montello, Wis.—A. Kehlet.

Moran, Ks.—Dr. D. Gwin (or Dr. D. Givin).

Morris, Ill.—J. E. Dawson.

Nashua, N. H.—G. W. Shaw.

Newark, N. J.—R. P. Bradner, Crescent Court, 629 and 631 Broad Street; P. J. Garrigan, Lewis Bros. & Culler, 238 Market Street; Chas. W. Menk, 106 Market Street; E. R. Petty, Seidler Drug Co., 21 Ferry Street; W. H. Stanford, 256 Mulberry Street.

New Haven, Conn.—Wm. Neely & Co.

Newpoint, Ind.—Metz & Putman (Grocers).

New Orleans, La.—Bogel Drug Co. (said to purchase for Dr. R. Sauvage, American Drug Store), H. Homberg, F. W. Kinberger (Grocer), Dr. Laplace (buys for American Drug Store), Dr. R. Sauvage (American Drug Store), Vermont Chemical Co. (purchases for Dr. R. Sauvage, American Drug Store), has no legitimate use for patents.

New York, N. Y.—Adams & Co., Bloom-
ingdale Bros., Brown, Thomson & Co., I.
C. Bryant, 51 Bank Street; Ehrick Bros.,
L. A. Frasier, Otto Frohwin, J. A.
Hearn & Son, Hegeman Corporation, 196
and 218 Broadway; J. Jungmann, George
Kneuper (City Hall Pharmacy), 263
Broadway; Lord & Taylor, R. H. Macy
& Co., W. G. Moffit, 60 Fulton Street;
Ridley & Sons, Grand, Orchard and Allen
Sts.; W. S. Rockey, 8th Ave. and 35th St.
Wm. B. Riker & Son, 353 Sixth Avenue,
Scotch Syndicate, Jno. Simpson, Simpson,
Crawford & Simpson, Stein Bros., Syndi-
cate Trading Co., 129 Franklin Street;
Terhune's, Eighth Ave., cor. 126th Street;
The New York German Apothecaries' Asso-
ciation, Wm. Wilson.

Norristown, Pa.—Chas. A. Fageley.
Norfolk, Va.—E. F. Weisel.
North Plainfield, N. J.—L. A. Frasier.
Oakdale, Cal.—Geo. Grierson, Rodden
Bros.

Oakland, Cal.—F. C. Churchill, D. W.
Kirkland, M. Trowbridge.
Omaha, Neb.—Bell Department Store,
W. R. Bennett Co., Boston Department
Store, Hayden Bros (Department Store).
Oneida, N. Y.—Hernan & Campbell.
Paterson, N. J.—Kent's Drug Store
(Benj. Kent), 236 Main St., 159 Main St.
Pawtucket, R. I.—Capwell's Pharmacy,
43 Broad Street; Wood's Popular Drug
Store, 285 Main Street.

Philadelphia, Pa.—Geo. D. Blomer, 6th
and Dickinson Streets; Geo. B. Evans, C.
G. A. Loder, 1539 Chestnut Street; Jos.
McKee, 402 Lancaster Ave.; Dr. J. P.
Miller, Miller Drug Co., having branch
stores as follows: Baltimore, Md., man-
aged by J. S. Hopkins and Herb Med.
Co.; Chester, Pa., managed by J. B.
Smith; Easton, Pa., managed by W. T.
Wiley; Harrisburg, Pa., managed by W.
H. Kennedy; Reading, Pa., managed by
Rankin Grissinger; Trenton, N. J., man-
aged by J. K. Wiley; Wilmington, Del.,
managed by J. Fletcher McLaughlin;
D. F. Schull & Co., 328 Market Street;
William T. Totten, 672 North Tenth Street
C. H. Wagener, 4th and Berks Streets;
H. K. Wampler & Co. (supplies cutters).

Pittsburgh, Pa.—Fleishman & Co. (De-
partment Stores), Markell Bros., Branch
Stores; Connellsville, Pa., New Haven,
Pa., Monongahela City, Pa.; Martsoft's
Pharmacy.

Pittsfield, Mass.—Wm. H. Currier &
Co., 8 North Street.
Portland, Ore.—F. A. Jones.
Potsdam, N. Y.—C. M. Peck & Sons.
Providence, R. I.—S. J. Briggs & Co.,
209-211 Atwell's Ave.; Green's Prescrip-
tion Drug Store, No. 1 Westminster St.
(also East Greenwich, R. I.), Hall &
Lyon (succeeding Howe & Carr), Leith
& Danforth, 163 Westminster Street; F.
L. Lathrop, 73 Vestminster St., 555 Eddy
St.; H. J. Watson, Cor. Aborn and Foun-
tain Streets.

Quincy, Mich.—C. W. Bennett.
Rock Island, Ill.—Marshall & Fisher, 2d
Ave. and 19th St.
Reading, Pa.—Rankin Grissinger.
Rising Sun, Ind.—Hemphill Bros. (sinc-
ed to purchase for A. O. Zwick, of Chain-
natl), George McAroy (or W. B. McAroy).
Rochester, N. Y.—Sibley, Lindsey &
Curr (Dry Goods).
Sacramento, Cal.—American Cash Store,
Capitol Store, Jost & Weber, Weinstock
& Lubin (Mechanic's Store).
Selma, Ala.—Day & Slack.
St. Louis, Mo.—E. B. Bribach, 4th and
Stein Streets; T. & E. Catlin, A. H. Cou-

sens, 600 Market Street; H. L. Doering,
10th and Cass Ave.; H. Fuller, 2247 Clark
Ave.; Jas. Gibson, Hall Medicine Co. (J.
F. Hall), Jos. Hilby, Judge & Dolph
Pharm. Co., Koch & Kempff, J. A. Land,
B. J. Ludwig, Raboteau & Co. (also buy
in the name of Jas. Gibson), Rice, Stix
& Co., M. Schulz (Millinery), 2050 S. Broad-
way, M. Shepard, Wm. H. Shepard, 320
N. Second Street; H. H. Vogt, Blair and
Cass Avenues; Geo. Wagner, Wolf-Wil-
son Drug Co.

St. Paul, Minn.—Samuel G. Dickinson,
(Glass Block), W. H. Elsinger & Co. (The
People's Golden Rule Store), Schuneman
& Evans.

San Bernardino, Cal.—Ham Bros.
San Francisco, Cal.—Cerr, Schloss &
Co., C. Cline, Jno. Doe, Eureka Bazaar
(F. D. Bradley), Hamburger Co., D. W.
Kirkland R. E. Miller, John Otten (Grocer-
er), 1534 Golden Gate Ave.; Owl Drug Co.,
Radovich Bros (Liquors), 29 Geary St.;
Rutledge & Nixon (Grocers), 206 Sixth St.;
Smith's Cash Store (the Smith Bros.,
Grocers), J. D. P. Teller (Broker), 24 Cal-
ifornia St.; "The Maze" (Department
Store), F. J. Tormey, M. Trowbridge.

Severy, Kas.—Simon Lybarger.
South Haven, Mich.—J. W. Kenney.
Springfield, Ill.—Geo. S. Connelly & Co.
Springfield, Mass.—Forbes & Wallace.
Taunton, Mass.—Cobb, Bates & Yerxa.
Taylor, Tex.—Cook Drug & Jewelry Co.
Tehachapi, Cal.—I. Asher (General
Store).

Trenton, N. J.—Geo. N. Thomas, J. K.
Wiley, Manager Dr. J. P. Miller's Store.
Troy, N. Y.—Drake & Moffitt, 3 Second
St., Mansion House Block, Chas. H. Wiber-
lerly.

Ukiah, Cal.—W. A. Hoffman.
Utica, N. Y.—Caroline P. Hackett (Mrs.
W. H.), J. M. & C. B. Crouse, Jno. O.
Jones & Sons.

Vallejo, Cal.—S. Dannenbaum.
Waltham, Mass.—Hall & Lyon.
Washington, D. C.—James O'Donnell.
West Burlington, Ia.—M. H. Gahegan
& Son.

Williamsport, Pa.—M. A. Laverty, Peo-
ple's Medicine Co. (J. M. Hadley).
Wilmington, Del.—J. Fletcher McLaugh-
lin, Manager Dr. J. P. Miller's Store.

Wilson, N. C.—Doane Herring, Nash
Street.

Winston, Mo.—J. M. Friede & Co.
Woodbury, N. J.—Robbins' Pharmacy.
Worcester, Mass.—Maynard's Pharmacia
(W. M. Maynard), 36 Main Street; P.
B. Moriarty & Co., 125 Park Street.
Woodstown, N. J.—E. B. Humphreys &
Co.

York, Pa.—Jos. H. Kirkle.

Ten years ago, when the internal re-
venue tax on playing cards was five cents
per pack, the consumption for the year
prior to July 1st, 1883 (when the tax was
taken off), was a little over 3,000,000 packs,
yielding a revenue of about \$150,000. The
conditions of this industry have changed so
within the last ten years, that the
yearly production has grown to nearly
47,500,000 packs, and it is estimated that
of this number fully 30,000,000 packs are
the very cheapest cards, retailing for five
cents per pack. These figures furnish the
basis for an argument that the proposed
tax of ten cents per pack will prohibit
entirely the manufacture of the cheaper
grades, while it is pointed out that a low
tax, say one cent per pack, would not
interfere with their manufacture, but
would yield the government considerable re-
venue.

THE LANOLINE PATENT.

A case involving the infringement of the
patent on Lanoline, and which attracted more
than usual attention, not only on
account of the great interests involved,
but by reason of the eminence of the ex-
perts who gave testimony, was recently
tried before Justice Romer in the High
Court of Justice, London, Eng. The parties
to the suit were Benno Jaffe and
Darmstaedter Lanolin Fabrik, Berlin,
plaintiffs, and J. Richardson & Co., Limited,
Leicester, defendants. The action
was brought to restrain the defendants
from manufacturing and selling "Anas-
palin," a mixture of purified wool fat
and vaseline, the claim being that this
article was an infringement upon the pro-
duct of Liebreich's patented process. By
Liebreich's method wool fat extracted
from the waste liquors of wool-washing
works by means of a centrifugal machine
which separates the emulsified cholesterol
in fat from the dirt and soapy liquor with
which it is mixed, is purified by means of
an alkali and methylated spirit or ether,
and mixed with water to produce lanoline.
The defendants quoted from the
writings of Dioscorides and Pliny, and
contended that a formula published by
the former over 2,000 years ago for pre-
paring from sheep's wool, an unguent
called "oesypus," covered the specifica-
tions for making lanoline sufficiently to
render the patent invalid. Prof. Dun-
stan, F. R. S., of the Pharmaceutical So-
ciety of Great Britain, who was called
by the plaintiffs, did not think that
lanoline as known at present could be
made according to Dioscorides' directions,
in which opinion he was supported by
Prof. Dewar, Dr. Passmore, and Dr.
Lauder Brunton, the latter testifying
more particularly from the standpoint of
therapeutics. Prof. Atfield, F. R. S., of
the Pharmaceutical Society of Great
Britain, thought that by the formula of
Dioscorides an ointment very similar to
lanoline could be produced, and that the
omission of directions for using an alkali
for the elimination of the fatty acids
was not of extreme importance, inasmuch
as nearly all of them can be washed out
with water, and, from a therapeutic
standpoint, a certain portion of oleic acid
in combination might be an advantage.
Dr. E. H. Paul also testified for the de-
fendants relative to the constituents of
wool fat, and its admixture with water
and presented samples of wool fat which
had been prepared according to the an-
cient formula. The case was ably con-
tested at all points, the cause of the
plaintiffs being championed by Sir Rich-
ard Webster, ex-attorney-general, while
the interests of the defense were in the
hands of Mr. Aston, Q. C., the eminent
patent lawyer. The decision of the court
is awaited with great interest, as it will
necessarily have considerable force as a
precedent in determining similar questions
of great commercial importance, and may
perhaps, give us an estimate which a
legal mind places upon the conflicting
opinions of experts.

Later advices inform us that this case
was decided in favor of the plaintiffs,
Benno Jaffe & Darmstaedter.

Two billion five hundred million gallons
of wine, equivalent to 15,000,000,000 bottles,
is stated to be the annual production of
Europe. About eight gallons for every man,
woman and child on that continent,

CO-OPERATION AND PROFIT SHARING.*

Without co-operation in some form or other, we are only savages. It is only the savage who has no association, who has not the benefit of co-operation, and we must not forget that all civilized society is essentially a society of co-operation.

In the earlier stages of development the strongest was the master for his own advantage and for the advantage of his favorites. Step by step that stage of civilization has passed away, until we have now a government by and for the people. That is co-operation on the largest possible scale. We all yield some of our rights for the common good. When we come down to smaller affairs in government, to our social arrangements, we find that in associations like this we resign some of our own individual self-seeking for the better advantage of all concerned. This is essentially co-operation.

I should have said in speaking about government that common schools, the cleaning of streets, and many other things whereby we agree to take some of the property of individuals in the shape of taxes for the common good, is essentially co-operation. Thus you see, we have co-operation the sacrifice of individual advantage for the common advantage in our most important surroundings. When we come down to business there are many features in which co-operation is present, that we may not think of.

Of course you are all familiar with the growth of co-operative societies, building associations, trade associations, all of them embodying the co-operative spirit; but there is another class of co-operation, which goes a little deeper into the daily affairs of men, in trade manufacturing, etc. Of that probably most of you know only in a desultory way and that principally by the failures made. The step up to co-operation in business has been laborious and dangerous to those attempting it. There are two classes of business co-operation, one arising entirely from the common people, wanting to start in business for themselves. This is known in co-operative circles and in the world as co-operation proper, in that all members stand on an equal footing, exactly as a stockholder stands in a corporation. I mean that wages and prices are regulated according to the interest that each one has, so that his share is the same as all the rest. Then there is another form of co-operation known as profit-sharing. The proprietors of capital who have already a business established, divide the profits that are made in the business with the men employed, as well as the capital used.

Profit-sharing has been extensively developed in France, and to a considerable extent in this country. Given a corporation which has a business and in which there is a profit, they take part for the capital and pay the usual salaries, wages and expenses as in ordinary business. The management continues the same, salaries and wages the same, and the ordinary rate of interest is charged for the capital—then of what is left there is a division made usually to the wage earners and the capital.

Now I think it may occur to all of you, as a matter of pure business advantage, that in such a method where every per-

son, high or low, becomes interested in the business, profit is better assured. We are all familiar with the fact that many houses break down after having established a very successful business, because one or two of the managing spirits are removed from control by death or otherwise. Then having nothing but ordinary hired men to rely upon, it is a matter of chance merely whether there is any one in the management capable of succeeding and holding it up. But where all have been interested in the profits, there is almost certain to be some who have developed and become thoroughly familiar with the business, and who are able to carry it on when the others leave it. Then I think you will recognize it is much easier to conduct a business where all have something at stake. The management will be better than where it is a question of mere wages. It has long been a custom in firms and corporations to give an interest to leading men, but I want to suggest that it is far more important to interest the rank and file, than it is the captains and lieutenants. It will probably never happen that a man who is capable of being at the head of a large concern could be stimulated to do any more than he would do any way. He has been elevated and promoted because he is possessed of an inherent energy that forces him at all times to do his best, and I think that that class of men would never be any more faithful whether his salary was \$1,000 or \$5,000. But men are not usually possessed of such inherent energy. The great majority of them are practically listless; will do about as little for their wages as they are required and must do in order to hold their places. They have been brought up to having just so much a week paid them; they have no ambition; they do just the work that is assigned them. There is nothing of the speculative idea about them. But give such men at the end of the year a proportion of the profits of the business as above described, and it acts upon them as a stimulus. Every one of them has some almost romantic interest in his work then. He is going to get a sum of money, he does not know how much, and he knows that every other man's work will have the same effect. Now a force consisting of 25 or 500 men, with that incentive all the time before them, it will inevitably put a different spirit into the entire force, and thus, while there may be a dividend paid at the end of the year of 5 or 10 per cent on the wages paid, capital loses nothing. For you will observe that no division is made until capital is at least tolerably well paid, and any division made after that can certainly work no marked injury on capital, and goes a long way toward insuring stability.

There are houses in France employing 500 or 1,000 men who have used this system for fifty years. The Maison Leclaire, of Paris, has been conducted on this plan since 1842, and in this country there are some three or four hundred concerns that are employing this system, most of them having started it during the last four or five years. But the other class of co-operation is far more extensive in its history and in its rate of growth at the present time. I may surprise you when I say that the largest commercial concern in the world, that I have any knowledge of, is the Co-operative Wholesale Society of England, and in speaking

about this I am speaking with absolute accuracy, as it is a matter of official report and of reports that are made every year. This English Co-operative Wholesale Society does an annual business of upwards of fifty-five million. They own and sail six of their own ships. They own the largest shoe factory in the world, equipped with American machinery. They have factories of nearly all the leading staples. Now this co-operative wholesale is, as I take it, as a business man, one of the most peculiar commercial concerns that can be well imagined. It is one from which you may all learn some important lessons. In the first place, they do their business exclusively for cash. They have their own buyers in the leading markets of the world, including one in Chicago and one in New York. They send department buyers to Greece every year to buy whole cargoes of dried fruits. When a customer wants to buy goods from the Wholesale, it makes no difference whether he is rated at a million or less, he must accompany the first order with the money and a copy of his last trial-balance, his rules, etc. After his first order, his credit being satisfactory, he may have one week's time in which to pay his bills.

Now the Co-operative Wholesale does its business with all its ramifications at an expense, including losses, of not quite 2 per cent. Now I think that those of us who squander a great deal of money in traveling men and other wasteful ways, for which there is nothing produced for us or anybody else, will consider this a marvelous association. Here is a business fabulously large, managed by men who have been brought up in it. Large salaries are not paid—the highest salary only being \$2,000—and the entire business is run, as I said before, at an expense of less than 2 per cent. But, of course, there is some explanation necessary to show how they can do business in this inexpensive way. The Wholesale is owned by retail co-operative stores. They are the stockholders and they are the customers. They have their buildings not only at the headquarters in Manchester, but they have warehouses in every important city as distributing centers. At all times they have rather more money than they know what to do with. Money is practically a drug with them. Their trade is uniform and they know about what to count on in their factory production and in their purchases.

The retail stores carry us back a little further. The present plan was initiated in 1844. There had been co-operation before that on quite a different plan. The present plan is to sell at the market price. The older plan was based on a great deal of sentiment, a great deal of religion—very good things in their way—but the people were not quite ready for so perfectly fair and mutual a principle as that of simply distributing their goods between themselves at cost and accumulating nothing, so that when bad times came and Owen, the founder, came to this country, the system went to pieces.

In 1844, twenty-eight weavers from Rockdale, which is close to Manchester, in a period of very hard times and knowing something about Owen's experiment, managed to scrape together \$40, and with that they bought some goods at wholesale, afterward retailing them to themselves without any expense at all; so that after having disposed of their

*Abstract from an address delivered before the St. Louis Paint, Oil and Drug Club, on Dec. 14, by N. O. Nelson.

stock they found they had in place of it say \$200, including the entire gross profit. Then they bought some more goods, more members came in, they got the laws amended so as to give them practical corporate exemption from liability. After awhile they began to pay dividends, not on the capital, but on the purchases; and this is the nub of the co-operative system. They allowed 5 per cent interest on the money that each member had in and not more. The remainder, after using a little for surplus, went out as a dividend on purchases. The man who bought a pound's worth would get so much in dividend; the man who bought a hundred pounds' worth, in the same proportion, and so on, the dividends being paid quarterly.

That store is still in existence, and it has paid practically a uniform dividend of 10 per cent on purchases. They have now a surplus in their business of a little over a million dollars and they do an annual business of about two millions. After this got started others began to spring up in the same way. The only party to this kind of co-operation that does not profit is the one that does the work. No provision is made in the co-operative distributing stores for any distribution of profits among the managers and workers. They receive the usual compensation for superintendence and clerical and manual labor, and they buy their supplies of the store which employs them; but in no way are they better off than they would be if working for an ordinary business firm.

Mr. Nelson also gave other illustrations in this country and elsewhere. He favored very much the abolition of personal credit, and said that he regarded the present system of personal credit as one of the greatest evils of the time. Very few people employed on wages or salary accumulated anything for a rainy day and he had found that where his firm built houses to sell to their people, there was hardly one in a hundred that had money on hand and ready to make the first payment. A personal study compelled him to believe that not 2 per cent of employed men had anything saved and were usually a couple of weeks behind in their bills. A moment's reflection will show that this sort of people must naturally feel dependent. They cannot be good and safe citizens. One of the features he most admired in the co-operative principle was that of its doing its business for cash, and one of the principal advantages was that it educated the members into buying everything for cash. He said that the failure of the co-operative stores of the granger and other societies, was due to the fact that they were all organized on a credit basis, while the successes which were gradually growing in number were on the cash principle.

Proof spirit is so called from an old method of determining the strength of alcoholic liquors which was called the "proof." Gunpowder moistened with the liquor to be tested was ignited, and it there was sufficient water in the mixture to prevent the ignition of the powder, the liquor was said to be under proof. If at the end of the combustion the gunpowder took fire, the liquor was over proof. Although popularly supposed to be one-half water, proof spirit should contain in 100 parts 50.76 of water and 49.24 of alcohol.

A CARBONIC ACID MOTOR.

An apparatus which seems particularly adapted to the window display of the pharmacist, giving at the same time an opportunity to enlighten the public upon some interesting scientific points, is thus described by Gustave Michaud, Sc. D., of Costa Rica, in the *Scientific American*, December 13, 1893:

"If made of the dimensions given below the motor will oscillate for three or four hours without being reloaded. Its various parts are as follows: Two 9 or 10-oz. bottles, B, with wide mouth. One glass tube, T, about 26 inches long, and $\frac{1}{4}$ inch bore (cost about three cents). Two glass tubes, E, 6 inches long each, $\frac{1}{4}$ inch bore (cost about two cents). Two rubber stoppers, K, each with two holes (cost about fifteen cents each). If cork stoppers are used the expense is much reduced, but a set of round files (rat tails) or a cork borer will be necessary to bore holes in the cork. Two rubber tubes, I, about 4 inches long, $\frac{1}{4}$ inch in diameter (cost about ten cents). One rubber tube, R, about 19 inches long, $\frac{1}{4}$ inch diameter (cost about ten cents). A piece of wood, A, shaped in the form of a quadratic prism; size 1x1x2 inches. Two pieces of marble the size of a nut, each wrapped in a piece of linen.

"To make the apparatus, take the glass tube, T, introduce each of its extremities through the holes of the two rubber stoppers, K, place the rubber tubes, I, on each of the ends of the tube, T. Take a needle with common thread and sew the pieces of marble, wrapped in linen, to the free end of the rubber tubes, I. Take the piece of wood, A, nail on each side of it a piece of sheet iron, S. Out of the top of the piece, A, saw a cleft in which to place the glass tube. Press the center of the tube, T, in this cleft, and keep it in place by means of two pieces of wood screwed on the top of the piece, A.

"Pass the tubes, E E, through the holes left empty in the stoppers, so that the length of the part to be contained in the bottle be equal to half of the height of the bottle. Connect the tubes, E E, by means of the rubber tube, R. After putting it in place, cut a small hole in its central part, O. Last, stop one bottle with either of the two stoppers.

"To set the apparatus in motion, fill half of the unstopped bottle with a mixture of one volume of hydrochloric acid with one of water. Stop it, keeping meanwhile the whole apparatus in a vertical position, and place it on a box or any other stand, five to eight inches high.

"The occlusion of the rubber tube, R, by the pressure of one of the pieces of sheet

iron, S, will prevent the escaping of the carbonic acid, and the pressure of this gas will drive the liquid from the lower to the upper bottle through the glass tube, T. Meanwhile the gas contained in the upper bottle will escape through the hole, O, made in the center of the rubber tube, R. If the center of gravity of the apparatus is not much above its oscillating axis, the upper bottle will fall after receiving little more than half of the liquid contained in the lower one. Then the change that takes place in the occlusion of the rubber tube, R, by the pieces, S S, will cause a repetition of the same phenomena in opposite direction.

"If you wish the apparatus to cease its motion for a while, without waste of chemicals, place any heavy body on the lower bottle, which will then completely empty itself into the upper bottle, and all chemical action will cease, as the marble is never in contact with the liquid in the upper bottle.

"When made of the dimensions which we give above, its working expenses will be about one-eighth of a cent per hour, cost of the hydrochloric acid consumed."

The Board of Education of New York City have been requested to interdict the passing of slates and pencils from hand to hand by pupils in the public schools. It is stated that cases of communicable disease are the result of this practice among school children.

The University of Nevada Agricultural Experiment Station at Reno, Nevada, is sending out Bulletin No. 21, which is the first of a proposed series which will treat of the noxious plants of Nevada. That the readers of these bulletins may be enabled to recognize the various plants discussed, specimens of the plants themselves with their seeds are, where practicable, pasted on the pages of the bulletin.

An item of interest coming to us from London is evidence of the fact that hard times have apparently struck that little village, for we learn that a certain city firm state to their customers that, owing to the high price of hay and straw, they will be glad to have it returned with empties. Perhaps a little investigation of this matter might throw a little new light on the box and cartage charge for the edification of the wholesale trade of the United States. Jobbers here are not drawing the line of charging for boxing material nor of requesting its return, but we cannot be sure what they may come to.

CORKS AND THE TARIFF.

The announcement of the tariff schedule of the Wilson bill has given rise to a great many protests from the manufacturers who are affected by the radical changes which are to be made, not only in the rates of duty, but in the manner of levying them. Here is one item in the new schedule, which, while it concerns but a small number of manufacturers, and concerns the consuming public even less, has already received its share of protests, and that is the proposed change on manufactured corks. In commenting on the situation and the probable effect of these changes, a prominent cork manufacturer said "Crude cork, or cork bark, comes in duty free. This country produces none, although the experiment of raising the trees in the United States is now receiving considerable attention, but with doubtful results. The old duty, previous to the McKinley act, on cut corks was 25 per cent ad valorem. While apparently just, this was assailed by our cork men on account of the persistent undervaluations. The McKinley tariff changed this to a specific duty of 15 cents per pound. This, of course, applied to all grades, good, bad and indifferent, and it was then demonstrated that a specific duty of 15 cents per pound on all manufactured corks was, on the average, equal to an ad valorem duty of 25 per cent as a revenue measure, provided, of course, that valuations were honestly made. The Wilson bill now proposes to change this duty to 20 per cent ad valorem. Our cork manufacturers claim that there can be no objection to a specific duty, per se, and assert that corks bearing a duty of 25 or even 20 per cent ad valorem and honestly appraised, cannot be imported and sold in competition with ours at a profit, and the inquiry is quite pertinent as to how a duty of this kind will be a source of revenue. The idea of levying a duty on the value of goods imported is in itself all right. The main objection which can be raised against it is the difficulty, or rather the impossibility, of correctly judging values by those to whom the government delegates this duty. It is a matter of difficulty to place a just valuation on some of the simplest commodities, and who except one thoroughly posted will be able to say that a consignment of corks valued in the invoice at 25 cents per gross, is not really worth 50 cents per gross. Our cork men claim that the old system has fully demonstrated that in this article at least, an ad valorem duty simply puts a premium on dishonesty. A specific duty with all its objections is fairer on the whole, and is no harder on the Spanish manufacturer than the proposed, or even the old duty, when the goods are honestly appraised.

Spanish corks are cut by hand, little or no machinery being used. It has therefore been said that American cutters, with their enterprise, their superior machinery and greater facilities ought not to fear the competition of foreign hand-cut corks, even if admitted duty free. This argument has apparent weight, but there are other factors which influence the conditions in this country. No one can tell from the appearance of a piece of bark what its value will be when cut. It goes into the machine and is cut into corks of a certain size. There may be one gross of select corks with a large

number of worthless ones, or the product may show more satisfactory results. The hand cutters, on the contrary, can avoid all imperfections in the rough bark, cutting around them, making small or large corks as the nature of the piece will permit. In this way the waste which, with a machine, is fully 65 per cent, is reduced to less than 35 per cent. A cork cutter in Spain earns from 25 to 40 cents per day. Here a good man receives \$2 per day, and in factories where payment is made by the 100, an expert can earn more than that sum. Corks are an important item in a druggist's stock. Poor corks are dear at any price. When discounts from manufacturers' lists were but 5 per cent, none bought poor grades, and the ordinary qualities, so called, were better than the superline are now. Then the staple brands were the well-known X and XX. Now the economical buyer ignores these and uses manufacturers' special brands, such as circle A, diamond M and XXX, paying more for them, but in reality getting no better than he formerly received as ordinary quality. The cork business is now in a bad way. Prices have been cut down and quality correspondingly affected. There is a movement on foot to remedy these evils, and to supply the trade with a grade of corks conforming more closely to that sold years ago. This movement, which none will welcome more than the drug trade, will be seriously retarded by the proposed tariff changes. Let the duty on corks remain as it is, and give us a chance to furnish better corks."

ANOTHER TRADE MARK CASE.

The words "Columbia" and "Columbian" have been used so much during the late year that it would be something of a relief to find that some one had a trade-mark on the words and could prevent their indiscriminate use. The Columbia Mill Co., of Minnesota, evidently took this view of the situation, and brought suit against W. W. Alcorn & Co., of Pennsylvania, to restrain the latter from using the word "Columbia" upon a certain brand of flour, the plaintiffs claiming trade-mark rights in the name so applied. The Supreme Court recently decided adversely to such right, and our only consolation in the premises is the fact that the court stated the law of trade-mark in the following terse language:

1. That to acquire the right to the exclusive use of a name, device or symbol as a trade-mark, it must appear that it was adopted for the purpose of identifying the origin or ownership of the article to which it is attached, or that such trade-mark must point distinctively, either by itself or by association, to the origin, manufacture or ownership of the article on which it is stamped. It must be designed, as its primary object and purpose, to indicate the owner or producer of the commodity and to distinguish it from like articles manufactured by others.

2. That if the device, mark or symbol was adopted and placed upon the article for the purpose of identifying its class, grade, style or quality, or for any purpose other than a reference to or indication of its ownership, it cannot be sustained as a valid trade-mark.

3. That the exclusive right to the use of the mark or device claimed as a trade-mark is founded upon priority of appropriation.

4. Such trade-mark cannot consist of words in common use as designating locality, section or region of country.

RULES AND REGULATIONS OF THE RETAIL DRUG STORE OF J. H. WEBBER, CASCADE, IOWA.

Store must be open from 6 a. m. to 10 p. m. from April 1 to October 1, from 7 a. m. to 10 p. m. from October 1 to April 1, and from 9 a. m. to 9 p. m. on Sundays.

All lamps must be filled every morning, and cleaned once a week.

All stores must be kept supplied with wood, and ashes emptied as required.

All stores and lamps must be well looked after at closing.

All lamps must be lit at dusk, turned on slightly and watched to prevent smoking. All floors must be swept at 9 p. m.

All counter show-cases, bottles and goods must be dusted every morning, and show cases, bottles, windows, graduates, cuspidors and prescription utensils washed clean.

All goods and utensils must be kept in their proper places, and all goods unpacked, marked and checked off as soon as the bill for them arrives.

Positively no smoking during business hours, and no scuffling or playing will be allowed in or in front of store during business hours.

Keep an eye on the front door, and be up and ready to wait on customers promptly.

Keep the want book handy and enter all wants before entirely out.

Keep your memorandum book handy and enter all debts and credits at once without fail.

Never get too familiar with any one in the store, especially people who are your seniors, as it shows very bad taste and makes a person unpopular.

Never stimulate any arguments or disputes by taking any part in them—it hurts trade.

Never encourage boys or loafers around the store, as it drives away the best trade.

Never tell any one Mr. or Mrs. Smith made this or that purchase, because Mr. or Mrs. Smith may not want any one to know anything about it. Be courteous and obliging to all customers, even if they do try your patience; we will make them good customers in time by so doing. Never postpone any work that is to be done, and do it neatly and systematically.

Always attend strictly to business, and give it your entire time and attention during business hours, and remember that the proprietor has rights and privileges which his clerks are not entitled to.

The many complaints on the part of foreign exhibitors as to treatment at the World's Fair assume a different aspect now that Chairman Thacher, of the board of awards, has announced that foreign exhibitors have received 63 per cent of the prizes.

It is claimed that the sounds accompanying the eruption of the Krakatoa volcano, in 1883, which is situated on an island in the Straits of Sunda, were the loudest that were ever heard. The explosions were heard in West Australia, 1,700 miles away, and it is estimated that it must have taken the sound two hours to travel that distance.

TRADE NOTES.

A new candidate for the favor of the Era's circle of readers is the Connecticut Witch Hazel Co., with offices at 132 Nassau st., New York, and distilleries at Chester, Haddam and Killingworth, Conn. This firm state that they have the capital and every facility for manufacturing a first-class article, and they invite correspondence for prices.

The Royal Malt Extract Co., of 1920 Washington avenue, Philadelphia, are after wide-awake druggists, and those who are not sure that they belong in this class will do well to write for particulars regarding the Royal Malt Extract. It gives satisfaction, keeps in any climate, pays better than others, and is sold under the retail druggist's label.

The well-known house of George Lueders, 238 Pearl st., New York, will hereafter be known as George Lueders & Co. There will be no change in the usual high quality of the essential oils handled by the firm, and in the future, as in the past, it will merit the special confidence of druggists, perfumers and soap makers, and the "Carlowa" brand of otto of roses will still continue to be a specialty.

An article which costs \$ 1-3 cents and retails for 25 cents certainly affords a good margin of profit. These terms are offered by the Wm. Conlson Drug Co., of Buffalo, N. Y., on trial orders for U. S. Corn Cure. They say that these terms on trial orders have built up a solid trade on this article, so that their claim that it is the best selling corn remedy on the market is one which has a solid foundation in truth.

The Penniston Food Warmer, manufactured by the Davol Rubber Company, of Providence, R. I., is an ingenious combination of rubber hot water bag and food warmer, which the druggist will have no trouble in selling to such customers as want either or both of these articles. The food warmer is sold with two sizes of pockets to suit either the ordinary nursing or sterilizing bottles, and by simply filling with hot water it will heat the food and keep it warm for ten hours, or during warm weather the bag may be filled with salted ice water, thus keeping the milk cool and sweet for children or invalids. The warmer is especially adapted for sterilized milk, thus avoiding contact with saucepans, etc., and as the food is always ready, a baby need not get thoroughly awakened while its food is being heated. Mothers and nurses are delighted with it and will support the druggist who keeps this article in stock. Write for full particulars and mention the Era.

The Era acknowledges the receipt of a very handsome calendar issued by The William Bengenthal Co., Milwaukee, Wis. On each page of the calendar appears a handsome steel engraving of some celebrated painting. It is a work of art and one which would not be out of place in the library.

Have you any novelties or specialties that you desire to introduce to the drug trade, but whose sales will not justify you in putting your own salesmen upon the road? If you have, see the advertisement of "Snap" in this issue of the Era. This is a splendid opportunity to introduce your goods.

There is little difficulty at this season of the year in selling remedies for colds, and the Lord Evedy Co., of Worcester, Mass., claim that even this little can be removed by keeping the right kind, which is Dr. Lord's Specific for Colds. They offer big inducements to druggists and solicit correspondence.

The Springer Torsion Balance Co., of 92 Rodeo street, New York, have lately gotten out a new scale beam graduated in three systems of weights—avoirdupois, troy, and metric—which will prove a useful instrument for familiarizing its users with the metric system, which has now become a necessity on account of its introduction in the U. S. P. 1890. Write for price list.

ART TILE CO.

Artistic effect and utility are the two great qualities which the Low Art Tile Co. claim for their soda fountains. These qualities form a combination which is strictly necessary in this age of the "soda water fad," from the fact that the man who has the finest fountain has a trade of the same class. The wide application of art tiles for decorative purposes renders the use of such material quite appropriate in a place of business where the public has been educated to expect the highest degree of decoration, and their employment in soda fountain construction affords an excellent means for this end. Utility, however, has not been lost sight of; on the contrary, the Low Art Tile Co. claim that colder soda with less ice can be obtained than from any made of other material. Intending purchasers should address the Low Art Tile Co., 952 Broadway, Chelsea, Mass., for full particulars.

LANOLINE PATENT.

New York, Dec. 18, 1893.

To the Editor:

We beg leave to inform you that the action brought against Messrs. John Richardson & Co., Limited, of Leicester, England, by Messrs. Benno Jaffe & Darmstaedter (the manufacturers of Dr. Liebreich's Lanoline) for infringement of the Lanoline patent has been decided in the English law courts in favor of the plaintiffs. This case is of considerable interest to all pharmacists and manufacturing chemists, and the decision has been awaited with much interest, as it bore upon a number of important scientific and commercial questions. The plaintiffs sought to restrain the defendants from manufacturing a preparation of wool fat similar to Lanoline, for the reason that purified wool fat in any form cannot be manufactured without producing Lanoline, and thus infringing upon their rights. Yours respectfully,

SCHULZE-BERGE & KOEHL.

Robert M. Green Co., 143 to 1419 Vine St., Philadelphia, promise something in the way of prices that should attract the attention of every prospective buyer of soda water apparatus. See their advertisement in this issue of the Era, and if you are contemplating a purchase of new apparatus or a change in your old one, and will mention the fact, illustrated catalogues will be sent you. Many druggists, especially those in smaller towns, do not engage in the soda water business on account of the price of a new apparatus. Many of these might find it to their advantage to buy second-hand apparatus. The Robert M. Green Co. has a large list of such apparatus of all makes, which they will be pleased to send upon application.

The Elkhart Paper Box Co. has sold its folding box plant to the Folding Paper Box Co., of South Bend, Ind. The latter will enlarge their facilities and hope to give their customers the best service possible. This part of the folding box work has grown so rapidly that this step has been deemed advisable for the better handling of the work. The shipping facilities at the new point are of the best, and they hope to avoid some of the annoying delays which they have been subjected to from the railroads. Mr. Wm. H. Barger, the manager of the Elkhart Co., will accompany the plant, and will endeavor not only to keep up the quality of the work turned out, but to improve upon it if possible. All correspondence addressed to them will have prompt attention. See their advertisement in this issue of the Era.

STEARNS' CALENDAR FOR 1894.

The Christmas greeting which Frederick Stearns & Co., of Detroit, Mich., are sending to their customers is of a character which far exceeds the many elegant expressions of good wishes which this firm sent out in former years, and is of exceptional interest on account of the introduction of a new feature in pictorial art, one to which much scientific research and effort have been directed during late years—that of photography in original colors. Stearns' calendar for 1894 is, we believe, the first example of this application of the new process which has been offered the public, and as such it possesses on interest aside from its artistic value. As regards the latter, however, a happy selection has been made in the reproduction of "The Rivals" by F. P. Michetti, a subject in which is included the inimitable coloring which nature gives to a pleasing landscape with that of two gaily costumed peasant girls whose graceful attitudes suggest the title of the picture. The details which attend the process are referred to at length in a small folder which accompanies the calendar. With the exception of the making of the plates all the work upon the calendar was done in the press room and bindery of the firm, and the result is certainly one in which they can take considerable pride. All regular customers of the firm will receive a copy of this elegant calendar. The feature of expense in the production of such work being a considerable one, the supply is, therefore, necessarily limited, and duplicates can only be furnished upon receipt of twenty-five cents to cover actual cost, postage and packing.

Itenders of the Era will do well to make the acquaintance of the Cincinnati Manufacturing Co., of Cincinnati, Ohio, whose advertisement appears in this issue. They make a specialty of brushes for the drug trade and their brush catalogue will be sent to all druggists who ask for it. Write to them and mention the Era.

The "compliments of the season" come to us from the W. J. M. Gordon Chemical Co., Cincinnati, Ohio, in the shape of a finely engraved card, the elegant appearance of which, together with the artistic skill which is displayed in its making, remind us strongly of a certain brand of glycerine in which both these qualities are found.

The Eagle White Lead Co., of Cincinnati, O., call the attention of the drug trade, in an advertisement in this issue, to their brand of lead, which is manufactured by the old Dutch process. Their product is on the market both in oil and in dry form, and they also manufactured lead and litharge. Prepare for next summer's paint trade by getting prices on the Eagle brand.

"How is your stock of these goods?" is a pertinent question which McKesson & Robbins, of New York, have placed, in this issue of the Era, before a list of reasonable and standard goods which every druggist is expected to keep in stock. There may be a few articles or remedies in this list with which some druggists are not acquainted. If such is the case, McKesson & Robbins will be pleased to mail descriptive circulars upon application.

Have you seen the Pickaninny Prize Puzzle, advertised in this issue, which the Standard Flint Glass Works, 1125-1128 Charlotte St., Philadelphia, have lately placed upon the market? It looks as if it couldn't be done, but the manufacturers assure us that it can. It is the puzzle of the season, and is meeting with immense sales. It retails at 19 cents, and a sample will be sent post paid on receipt of that amount. Write for special prices to the trade.

Mr. John C. Comstock, for the past 4 years representing F. R. Arnold & Co. on the Pacific Coast, and Mr. Lewis A. Langdon, formerly traveling salesman for Daniel Stewart, have formed a co-partnership and will carry on a general drug-brokerage business at 87 Commercial Club, Indianapolis, Ind. Among other important agencies, they have that of Tarrant & Co., New York City; Albany Chemical Co., Lawrence Oil Co., Cleveland; and Geo. Lorenz, Toledo.

CRIBBS MFG. CO.

The offer of the Cribbs Manufacturing Co., of Pittsburg, Pa., in this issue of The Era, merits some attention. The investment for a gross of Cribbs' German Cough Syrup is \$22. With every bottle is enclosed a ten-cent sample of Cribbs' Liver Pills. Two dozen twenty-five-cent boxes of these pills are also included free of charge with each gross order. In addition, handsome cards, signs and copies of paper called "Public Opinion" are furnished and the goods are advertised in local papers. Finally, if any of this cough syrup is left over next May, it can be exchanged for pills, liniment or worm syrup. Write to the manufacturers regarding this offer and mention the Era.

IMITATION LUBIN'S POWDER.

We are informed by the attorney for the proprietors of the Lubin extracts and toilet powders that an injunction has recently been obtained against one C. R. Bailey, who has been making and selling for several years an imitation of Lubin's powder. Suits are about to be commenced against several prominent houses who have been selling these counterfeit goods.

The next time the subject of buying pure oil of tar arises, write to Hansen & Smith, Wilmington, N. C. They quote this article at eighteen cents per gallon and put it up especially for the drug trade in iron-hoop barrels. They manufacture a very complete line of tar products, and their location in the heart of the producing country enables them to furnish a superior product at lowest prices.

Sharp & Bohme, manufacturing chemists, 41 John st., New York, have prepared something new in the shape of hypodermic tablets of the favorite salicathartic magnesium sulphate. These tablets are perfectly soluble, accurate and non-irritating, and in doses of one to three grains subcutaneously have been found to possess a very efficient purgative action. An interesting clinical report which was presented at the recent meeting of the Pan-American Medical Congress, at Washington, by Dr. Robe, and trial samples will be sent upon application.

BEESEX.

The attention of retailers is directed to the advertisement of Theodor Leonhard, Paterson, N. J., in this issue of the Era. Mr. Leonhard's old brand of beeswax, "T. L." extra white, enjoys a high reputation for purity among the trade, but from the fact that it is a pure beeswax it is higher in price than the chemically bleached or blended waxes. To meet the demand for a cheaper article, Mr. Leonhard has lately put out a new brand, "Diamond L." which sells at a little lower figure, the only difference between it and the older brand is that it is not bleached quite so white, the quality remaining the same. All druggists who are interested in the matter of procuring pure beeswax should write for sample cakes of these two brands, and specify "T. L." or "Diamond L." when ordering of their jobbers.

MERZ CAPSULE CO.

Does your physician know that you can fill his prescriptions for filled capsules without waiting to send to the jobber for the particular kind wanted? Do you know that you can do this kind of work with the capsules and simple apparatus furnished by the Merz Capsule Co., of Detroit? This is not only a question of enterprise and convenience on your part, but it is one that concerns your cash account. It does not take much knowledge of arithmetic to see the profit point in this calculation. You have no dead stock by adopting the Merz plan, as you only manufacture as wanted to fill your local demand. Take the price of 1,000 empty elastic capsules, at \$2.75 (the filling appliance is free), then figure the price in bulk of any oil or other liquid with which you wish to fill them, then compare the result with what you have to pay for filled capsules, and invest your money where it will give you the best returns.

In looking over the "Want Advertisements" in this issue do not fail to note that of W. C. Smith, Oakland, California. Any druggist who desires to take up his residence in the land of fruit and flowers may find the way made clear by investigating Mr. Smith's offer.

Henry K. Wampole, manufacturing pharmacist, 441 Green st., Philadelphia, quotes some prices on Beef, Wine and Iron, in bulk, which are certainly worthy of attention. The figures can be used for comparative purposes, and samples of the preparation will be cheerfully furnished so that the quality can be compared with the product of other manufacturers.

Cooper & Hardenburgh, of Kingston, N. Y., believe that the sample plan affords the best method for introducing their goods to the public, and will furnish the dealer 50 samples with every order for 3 dozen Cooper's Floral Dentine accompanied by \$4.50. The samples sell the goods, and a clear profit of 100 per cent is realized from their sale.

LITTLE LIVER TABLETS.

The offer of the Acme Tablet Triturate Works, 96-98 Maiden Lane, New York, is undoubtedly one of the most unique ever offered to the drug trade. Remember, they furnish free of cost all that anyone can sell within thirty days on condition that the retailer will order and pay for a like quantity within the following thirty days. They also furnish advertising matter to help sell the goods. These tablets are packed in boxes of three dozen each. They cost eighty-four cents per dozen and retail at ten cents.

The advertisement of Utard & Co., of No. 3 Union Square, New York, shown on another page in this issue of the Era, refers to a department of practical pharmaceutical art, which has heretofore been neglected by the druggist on account of the difficulties involved in its practice. The use of cachets as a means for administering those medicinal preparations which, on account of their insolubility or objectionable taste, cannot be taken in syrups or other mediums, is already well established in Europe, and an opportunity is now offered by which the ordinary pharmacist of this country can put up in cachets any drug in powder form. The physician and the public very readily see the advantages of this method of medication when once it is called to their attention, and the simple apparatus for making cachets is destined to become one of the fixtures in the laboratory of the dispensing pharmacist. Write to Utard & Co. for free samples, illustrated pamphlet and prices. Mention the Era.

A 100 per cent profit is what the druggist is after during these hard times. The Celery Medicine Co., of Kalamazoo, Mich., say you can make that profit by selling Loring's Celery Cough Drops. Nine out of ten people like celery and the same proportion like celery cough drops. This company furnishes a box containing thirty five-cent packages for seventy-five cents. Three box lots at seventy cents per box. They also furnish advertising matter with every order. Write them and mention the Era.

Attention is directed to the advertisement in this issue of Menn & Stubenrauch, manufacturing pharmacists, 83 John street, New York. The fluid extracts manufactured by this firm are prepared strictly according to the U. S. P., and their catalogue contains some ideas upon the preparation of this class of pharmaceuticals which are quite pertinent and to the point, and should engage the attention of all druggists. This firm are also sole agents for the fruit tablets of the London Tablet & Specialties Co., Pepsinum Purum Plane Solubile manufactured by Dr. Heinrich Byk, Berlin, Germany, and the French Triple Extracts manufactured by Perrier & Co., Grasse, France. Write to Menn & Stubenrauch for their last catalogue.

THE "REX" BRAND.

The Cudahy Packing Co. are distributing a fine lithographed folder with the compliments of the season. Aside from its artistic excellence it contains much interesting information extracted from the business statistics of the firm for the year ending November 30th, 1893. The total sales amounted to \$22,327,622; total pay roll, \$1,249,227; number of employees, 2,500. The works at South Omaha cover a ground area of twenty-three and a half acres and the total floor area in the buildings is equal to seventy-five acres. The company produces 3,461,485 pounds of butterine annually and made 10,000,000 pounds of fertilizers last year; 548,286 hogs, 203,651 cattle and 22,668 sheep were killed during the period mentioned. That portion of output which is marketed through the Cudahy Pharmaceutical Co. consists of the well-known "Rex" brand of extract of beef and pepsin. Of the latter 30,000 pounds are made annually and of the former 200,000 pounds.

SPECIFY MERCK'S.

Merck & Co., of New York, assure the pharmacists of the United States that the placing of the word "Merck" after the names of fine chemicals, which they have occasion to order, will insure the receipt of products which are recognized as standards for purity, reliability and general excellence. This superiority is due to several causes, one being an experience in manufacturing which has come through years, beginning with a small apothecary shop in Darmstadt in 1668, and extending up to the present time, the firm of E. Merck now representing one of the most extensive and diversified establishments in the list of German chemical industries. Another cause is the close relationship which has always existed between members of the firm and the leading men of science in their respective periods, a connection which is largely responsible for the introduction of many remedial agents which have been received with great favor by the medical profession.

The uses to which the gilt tin cans manufactured by Joseph G. Taite's Sons, Philadelphia, Pa., can be put, are too numerous to admit of full mention. They are especially adapted, however, for holding drugs, herbs, powders, etc., and their attractive appearance renders them quite suitable for shelf ware. They are for sale by wholesalers throughout the country, while the manufacturers will be glad to answer all inquiries regarding their goods and prices.

The New Year's greeting of A. D. Puffer & Son in this issue of the Era, "Ring out the old—Ring in the new," is especially applicable both to the old and new years, and the old and new soda fountain. The druggist himself is the best judge of the propriety of "ringing out" his old soda fountain, but Puffer's catalogue for 1894 of the "Frigid" soda apparatus will tell him just what kind of a new one to ring in. This catalogue is now ready and will be sent upon application.

That "One Bottle Cures," is so true of Yellow Pine Compound for rheumatism, that our dealers need not offer three bottles for \$5 as an inducement to buyers. One bottle sold is so good an advertisement that two more, or two dozen more, will sell on its recommendation. Dealers are constantly inquiring for a medicine that will cure rheumatism. Yellow Pine Compound fills the long-felt want. Send for price card and circulars to Yellow Pine Extract Co., Allegheny, Pa.

SUNNY SIDE STOCK FARM.

Mr. Wm. Fitzgerald, a prominent breeder at Cresco, Iowa, writes under date of December 4th as follows: "I have used Quin's Ointment for the past three years, and with wonderful success. I have removed bunches and also cured a bog-spavin in four weeks. It has no equal for curbs and will do all you claim." For curbs, splints, spavins, windpuffs and bunches use this wonderful remedy. Quin's Ointment is endorsed by the leading breeders from Maine to California. It will pay all druggists to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers, who are in the horse breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

DERMADOR.

In their advertisement in this issue of the Era, Messrs. D. Ransom, Son & Co. make a special offer to druggists. The advertising matter can be considered A1. They do not make the mistake of having the horse book one mass of advertisements. It is a book which will be read and appreciated by horsemen generally, containing as it does valuable information with descriptive cuts on such subjects as these: "Man and Horse Compared," "The Teeth as Indicators of the Age," "Remarks on the Hoof," "Temperature and Pulse," "The Trotting Horse Standard," "Percentage of Blood in Pedigree," "Stable Hints," "Big Prices Paid for Trotters," "How to Examine a Horse for Soundness," etc., etc. It is a book that will be read clear through and retained—not glanced over and rejected. The lithograph, too, is a fine piece of work and closely resembles a water color.

RULES FOR CONDUCTING A PHARMACY.

"During business hours all hands must be on their feet, and must be employed either in waiting on the counter or at some regular store duty."—Parrish's Treatise on Pharmacy.

If 1,000 physicians were to give the same testimony in a certain case where the result depended upon expert opinions, there would be but little doubt as to the verdict of the jury. This is exactly the case with Stewart's Gipsy Pile Ointment, manufactured by Fred W. Stewart, Oswego, N. Y., only the favorable evidence keeps coming in. An interesting feature (to the druggist) of this preparation is the price—costs 25 cents, retails for 50 cents, and will be sent express or postage prepaid.

It is hardly necessary for so old and well-known a firm as Morrison, Plummer & Co., of Chicago, to call attention to the platform upon which they have built up a trade of great proportions and won the confidence of their patrons. In summing up the results of the Columbian year they find upon their books the names of many new friends, and it is to such that their advertisement in this issue of the Era is especially directed, while at the same time their old customers will read it with interest and approbation.

NEW REAGENT BOTTLE.

Queen & Co., of Philadelphia, have lately put upon the market a new reagent bottle, which is a great improvement over the various styles heretofore in use. All stoppers are dispensed with by the use of glass caps, which are ground to fit the outside of the neck of the bottle. The caps do not stick and by their use the lip of the bottle is kept free from dust. The name of the reagent appears upon the bottle in raised letters and the caps are marked on the top with the formula to prevent them from being mixed up, as is frequently the case with stoppers. The caps can be laid down without picking up dirt, as wet stoppers are apt to do. The glass used is what is known as "potash," which best resists the action of alkalies and other reagents. The sizes are better, being 5 and 10 ounces instead of 4 and 8 ounces, and they are as cheap (size being considered) as the old form. A set of forty bottles is furnished for \$8.90. Write for further particulars and mention the Era.

"Proved by their hides" is the way the Chicago Rat Paste Co., 210 1/2 South Clark street, Chicago, refer to the efficacy of "Knockemout" in destroying rats, mice, cockroaches, etc. The chemicals composing it are of such a character that they coagulate the blood corpuscles and destroy the odor of the vermin, leaving nothing but the dried skin. Costs but seventy-five cents per dozen, and a half million boxes were sold last year.

While the use of iodoforn can be strongly recommended from a therapeutic standpoint, its odor is such that the unfortunate patient who is compelled to use it, occupies, for the time being, a position in human society quite similar to that of the Mephitis Americana in the animal kingdom. This unfortunate condition can be avoided to a great extent by the employment of Iatrol, which is claimed to be superior to iodoforn as an antiseptic, and is also inodorous. It is manufactured by the Clinton Pharmaceutical Co., of Syracuse, N. Y., who will furnish full particulars as to its application and properties upon request.

You are not thoroughly posted upon the cork question unless you have investigated the quality and obtained the prices of all the different brands upon the market. All manufacturers expect competition and constantly put forth their best efforts to improve their goods beyond that point, and this condition is largely brought about by discrimination on the part of buyers. With this idea in mind the Flower City Cork Works, of Rochester, N. Y., solicit trial orders for their brands of corks for druggists' use, and will be pleased to quote prices to all inquirers.

KUMYSS.

The endorsements which Kumyss has received from the medical profession as a remedy in dyspepsia, feeble and imperfect digestion, anaemia, convalescence from fevers, etc., are enough to commend it to the favorable consideration of the pharmacist, and in many instances a profitable trade in this preparation could be built up by displaying a readiness to order it as it is demanded in the practice of the physician. The Kefir Kumyss, manufactured by R. E. Rhode, 504 North Clark street, Chicago, is especially recommended for medical purposes, from the fact that the true Kefir ferment known as *Diospora caucasica*, which possesses the power to peptonize albumenoids, is used in its preparation.

THE SCATES PLAN.

Those who have seen the advertising material used by the Scates Medical Company, of Westbrook, Maine, unite in saying that it creates an immediate demand for the goods. Vitalized Tonic and Lax-ive do not encounter the difficulties which usually obstruct the success of new remedies, as the purchaser knows that he runs no risk in making a trial of these preparations when a slight draft for the price of the remedy is available in case there is no benefit or cure. As an extra inducement to the druggist, the Scates Medical Co. issues to each purchaser of \$10 worth of goods a share of their common stock, whose value is equal to the amount of the purchase, and one-fourth of the profits of the company are set aside to pay dividends upon such stock. Write for full particulars, references and samples of advertising.

Chas. F. Knide & Co., 216 East Lake St., Chicago, Ill., are manufacturers of drug store fixtures of every description. They have fixed up many fine stores, one of which at Hastings, Neb., is one of the handsomest we have seen. A catalogue and information will be sent to anyone requesting it.

The Morley Drug Company, of 67 and 69 Franklin st., Chicago, is a comparatively new firm, but its members are men who are thoroughly posted in the needs of the drug trade. They are manufacturers' agents for a number of good firms, among which are Gilpin, Langdon & Co., Baltimore, and Herf & Frieichs, St. Louis. They make a specialty of first-class goods in original packages, and believe that the prices which they quote and the quality which they are able to furnish will bring them a just proportion of the jobbing drug trade. They issue a monthly price list and will be glad to furnish it on application.

The Amick Chemical Co., of Cincinnati, O., say in regard to their chemical treatment for tuberculosis, that it is offered by them, not as a mere palliative, but as a restorative in the majority of cases. The theory upon which it is founded is opposed to the bacilli idea, Dr. Amick claiming that the remote cause of consumption is mal-assimilation beginning in the intestines with evidence of fermentation and imperfect absorption, and that the microbe is simply an evidence of the presence of the disease, not its cause. The chemical treatment includes constitutional medication, and an inhaler used in a very small and convenient inhaler devised by Dr. Amick. Any physician who desires to inform himself as to the merits of the treatment will, upon application, accompanied by a report of the physical condition of the patient upon whom it is to be used, be furnished, free of charge, a supply of each of the medicines, with inhaler.

The above illustration shows an apparatus which should attract the attention of every druggist who sells soda water. The question of how to cleanse glasses thoroughly and easily is settled in a very complete manner. The apparatus is attached to a water supply pipe and a soda or mineral water glass is placed over the brush, a slight downward pressure starts several jets of water, and a few revolutions of the glass around the brush serves to completely remove all particles of cream, etc., the jets of water completing the operation by thoroughly rinsing the glass. The apparatus is manufactured by L. L. Rowe, 16 Howard st., Boston, Mass., and every druggist who contemplates improving his facilities for dispensing soda water should investigate this handy appliance.

Careful pharmacists and manufacturing chemists employ none but the best of everything. In this classification belong "Circle A Corks" which received the highest award at the World's Fair. All jobbers and wholesalers have them or they may be obtained from the manufacturers: Armstrong Bro. & Co. (Incorporated), Pittsburg, Pa.; Armstrong Brothers Co., New York City; Fay-Armstrong Cork Co., Chicago; Armstrong-Gilbert Cork Co., St. Louis, Mo.

ARSENAURO.

The preparations of gold known as "Arsenauro," or Liqueur Auri et Arseni Bromidi-Barclay and Liqueur Auri Arseni et Hydrargyri Bromidi, which have been presented to the medical profession through the labors of W. F. Barclay, of Pittsburg, are now being prepared after Dr. Barclay's formula by E. M. Johnson & Co., 38 Platt street, New York. All matters relating to the commercial aspect of the subject should be addressed to this New York firm, while all inquiries as to the therapeutic action of the preparations should be addressed to W. F. Barclay, M. D., 474 Fifth avenue, Pittsburg, Pa., who will be pleased to furnish literature bearing upon new applications and new combinations of this important article of materia medica.

CREOSOTAL.

Creosotal, or creosote carbonate, manufactured by Dr. F. von Heyden's successors, Radebeul, Germany, is one of the best forms of Beechwood Creosote for consumptives. Its action is not caustic and irritating to the mucous membrane of the digestive organs, like that of creosote, and it is non-poisonous to such a degree that it can be dispensed as a pure undiluted substance by the teaspoonful without disagreeable effect upon the most sensitive patient. Creosote Carbonate is administered either pure or in capsules, or mixed with four to twelve parts cod liver oil, or as an emulsion of one-half to two teaspoonfuls, beaten up with the yolk of an egg, diluted with water, sweetened and some aromatic added. Schering & Glatz, 55 Maiden Lane, New York, are the sole agents for this preparation in the United States and will be pleased to furnish pharmacists full literature upon Creosotal.

THE WORLD'S FAIR FOR SALE.

LOOK AT IT! The Michigan Central has arranged with one of the best publishing houses in the United States for a beautifully printed series of World's Fair pictures, to be known as the Michigan Central Portfolio of Photographs of the World's Fair.

The original photographs would cost not less than a dollar apiece, but the Michigan Central enables you to get 16 pictures for 10 cents.

It's the finest. It's the most complete.

It's the best. It cannot be beaten.

If you saw the World's Fair, you want it as a perpetual souvenir of a memorable visit.

If you didn't get there you want this to see what you missed, and to fill your mind with the beauty and glory of the White City.

Call on the nearest Michigan Central ticket agent, and he will furnish you with the first part and tell you more about it, or write to O. W. Ruggles, G. P. & T. A., Chicago, enclosing 10 cts. for the collection.

The Rochester Candy Works, Rochester, N. Y., report a very gratifying trade in their satin gloss Butter Cups, which they put upon the market for the fall and winter trade. The druggist who desires to get people into the habit of eating good candy and coming to his store after it had better include a trial order for "The Delicious" confections as one of the means to accomplish this end. People will not go to the same place more than twice for poor or indifferent candy.

"A druggist's profit" is certainly a theme which excites the interest of everyone in the drug business. Frederick F. Ingram & Co., of Detroit, Mich., have delivered some forcible remarks on the subject in their advertisement in this issue of the Era, and they have some figures making the matter still plainer which they will furnish every druggist who will send them his name and address. Every request of this kind will bring the druggist a copy of the firm's illustrated catalogue and Poison and Liquor Register.

Colburn, Birks & Co., of Peoria, Ill., have reason to be satisfied with the results of their endeavors during the past year to impress upon the drug trade and public in general the advantages of using a pure, unadulterated rye whiskey for medicinal purposes, and that their efforts have been appreciated is evidenced by the increased sales of Clarke's Pure Rye Whiskey. Colburn, Birks & Co. extend the compliments of the season to their friends and customers, and wish them all a prosperous and happy new year.

Aside from the general excellence of the goods themselves, the Pomona Fruit Juice Tablets manufactured by Duquette & Co., of Council Bluffs, Iowa, are packed in such a way as to attract attention on the part of the public, which results in a demand for the goods. The attractive square flint glass bottles with ground glass stoppers are an ornament to any store. The goods are packed twelve bottles in a case, and there are over twenty flavors to choose from. Write for prices on case lots delivered at your nearest railroad station.

The pure mass licorice manufactured by Mac Andrews & Forbes, of 55 Water street, New York City, has heretofore been received with so much favor by the tobacco trade on account of its superior qualities, that this firm desires to call the attention of the drug trade to their product as being especially adapted to pharmaceutical purposes. The goods are sold under the firm's trade mark in cases weighing about 250 pounds net, and the drug trade will learn something interesting in the way of prices by writing to them.

It is not too early to begin to figure on the Easter Egg Dyes, and your calculations on this subject should include a consideration of the offer of O. A. Ohl, Tiffin, Ohio, who puts up such dyes in lozenge form, each package containing six colors, which will color from three to five dozen eggs. The goods are put up in boxes of 100 packages and cost \$2.50 per box, each package retailing for five cents. In addition to this the manufacturer gives free of charge one dozen Indian Corn Cure, so that the investment nets \$3.

Irwin, Kirkland & Co., successors to Smith, Hubbard & Co., manufacturing pharmacists, Decatur, Ill., report a very satisfactory business during the past fifteen months. They are continually adding new remedies to their large assortment of "non secrets" for the drug trade. They also prepare a full line of fluid extracts, compressed tablets and pharmaceuticals. They claim best quality and lowest prices for their goods and request the drug trade to send for their catalogue.

It is not a difficult matter for the druggist to find out that Duroy & Haines, of Sandusky, O., mean just what they say in regard to the superiority of their wines for medicinal purposes. The question can be easily decided by sending for samples and subjecting them to all possible tests. A greater portion of the drug trade is already familiar with the wines of this firm and to that portion the advice is offered that this knowledge should be used when goods are ordered. This firm has now on hand a fine stock of fully matured wines, and recent enlargement of their facilities enables them to attend to the wants of their customers in the most satisfactory manner.

"TRIPLE REFINED."

We desire to call the attention of the trade to the cry of certain manipulators of rock candy drippings, who claim superiority for their product through a certain hocus-pocus process called "triple refining." We have always maintained that this residue from rock candy is not pure, and that the "drippings" thus refined are not as desirable as a syrup made of the rock candy crystals themselves. A part of the mother syrup is, in the purifying process of nature, taken up and formed into crystals. A syrup made by melting these crystals is the only rock candy syrup properly so called. A syrup thus made is pure and needs no "triple refining." If merchants will insist upon getting a syrup and not drippings or drips, these "triple refined" fakirs, who are perennially discovering new processes will find themselves very lone-some indeed. At first such goods were branded "refined," then came the term "double refined," and now an eastern concern is loudly proclaiming the advent of the "triple refined." Assuredly if "triple refining" is a good thing, quadruple refining is better, quintuple still better and so on ad infinitum. Be logical, you of the "triple refined." Why do you triple refine only, or why do you triple refine at all, unless your kettles have become the dumping ground for the other members of the "Triple Rock Candy Combination." If so, does it seem fair that one member of the trust should be made the sewer for the other members who have other goods to sell besides rock candy and its products? Does it seem just that they should be permitted to melt the crystals into syrup while one firm is left to "triple refine" the drippings? Is it necessary to perpetuate a fraud to keep in business?

The D. E. Scully Syrup Co. manufacture a pure rock candy syrup directly from the crystals. Send for prices on rock candy and rock candy syrup. We are not governed by trust prices.

D. E. SCULLY SYRUP CO.,

49-51 River St.

Chicago, Ills.

RULES FOR CONDUCTING A PHARMACY.

"Have a place for everything, and keep everything in its place." This rule is generally observed in all pharmacies, but our artist advances a theory as to why some things cannot be found when wanted.

MAP OF THE UNITED STATES.

A large, handsome map of the United States, mounted, and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address, on receipt of fifteen cents in postage, by P. S. Eustis, Gen'l Pass. Agent, C., B. & Q. R. R., Chicago, Ill.

An originality which has been well sustained has enabled the proprietor of Paas Easter Egg Dyes to keep them well to the front as the best article in every way for their specific purpose. First made in 1880, every improvement that promised any advantage has been promptly utilized, until now they are perfection itself. The attention of the trade is called to the fact that Easter comes early this year, on March 25, so orders should be placed early. The entire trade will be amply supplied. Your jobber has them. Don't delay placing your order.

TO THE TRADE.

We want every druggist to know that we are one of the largest wholesale distributors of Rye, Bourbon and Malt Whiskies in bond and tax paid, in this country. We can furnish Eastern and Western Ryes, Sour Mash and Sweet Mash Bourbon and Malt Whiskies. We can supply fine blended whiskey under our own trade mark, as well as straight Ryes and Bourbons of our own bottling. We are agents for the product of Sen. Stanford's celebrated "Vina" ranch, whose wines and brandies are not excelled in this country.

We are headquarters for Alcohol and Cologne Spirits, which we supply at the lowest market quotations, and in addition to these staples we are agents for most of the celebrated cordials, such as Creme de Menthe, Kuemmel, Maraschino, and we carry in stock many others. A postal card from you will bring a printed list of the goods we carry, and we are pleased at all times to answer any inquiries from druggists regarding our goods.

THE WEIDEMAN CO.,

53, 55, 57 and 59 Water st.,

Cleveland, Ohio.

The question of manufacturing compressed tablets is still a live one with the retail druggist. A great many are already doing such work with gratifying success, while many appear to be waiting to see the result of others' experiments in this direction. A. Læggøe & Co., Trenton avenue and Adams street, Philadelphia, claim the latest, simplest and best in the Keystone tablet machine, and their circular and price list is quite convincing in the way of showing the druggist how he can profitably engage in the business of manufacturing tablets for his own trade, and supply the needs of his neighboring physicians. Write for full particulars, mentioning the Era.

Any druggist whose shelf ware is becoming shabby on account of the breakage of glass labels, should remember that Dr. R. R. Lansing, 289 Jefferson ave., Detroit, Mich., can reproduce any style of glass label in his new glassline labels. These labels are made from transparent sheets of celluloid and cannot be distinguished from glass labels. Labels of this material can also be furnished in any style or design to suit customers. Send 8 cents in stamps for samples and mention the Era.

Two qualities which should belong to deodorizers and disinfectants for general use, are absence of odor and toxic properties. These properties are distinguishing features of the well known Bromo-Chloralum, manufactured by the Bromo Chemical Co., New Lebanon, N. Y., and therefore make it a preparation which the druggist can safely recommend for popular use. In order to further extend the employment of this compound, 500 counter wrappers are furnished, with the retailer's name printed thereon, with every order for 3 dozen, and samples will be sent to such physicians as may be indicated by the druggist.

An interesting story is told by a Memphis paper about the fight between the independent crushers and the American Cotton Oil Company in that vicinity. The latter began operations early in the season by advancing prices for seed in the neighborhood of Memphis, and the business finally became too unprofitable for the independent companies to remain in the trade. One of the latter retaliated by sending agents into Alabama and Georgia to buy seed at a slight advance over trust prices, and at Columbus, Miss., where the trust had been paying \$12 per ton, an independent warehouse was established which offered \$14. This price was promptly met by the trust, as was an additional raise to \$16. It was then discovered that the independent man had not bought a load of seed. He had simply paid the sellers 50 cents to drive through his warehouse into an adjoining strip of woods, and thence by a circuitous route to the American Company's warehouse.

TAX UPON PROPRIETARY GOODS.

The following letters, which explain themselves, are being distributed by the chairman of the committee on legislation of the N. W. D. A. and the Proprietary Association:

Pittsburg, Pa., December 19, 1893.

Gentlemen—I have been informed that the majority of the ways and means committee are contemplating a stamp tax upon proprietary medicines. A recent dispatch from Washington City states that this feature of the internal revenue bill, now in process of construction, has been decided upon. The bill will probably be reported to the House some day next week. I hope you will write your Representatives without delay, as there is no time to be lost. Be quick and emphatic in your protest against the revival of this war measure.

Yours truly,

GEORGE A. KELLY, Chairman.

Committee on Legislation, N. W. D. A.

Lockport, N. Y., December 13, 1893.

Dear Sir—My attention has been called to the fact that one of the congressional committees has in preparation a bill providing for the placing of a stamp tax upon proprietary medicines. The tax was recommended some little time ago, I learn, but has just recently secured the attention of the committee. I quote from a late issue of a leading newspaper in relation to this matter, as follows: "Statistics have just been obtained from the Treasury Department which indicate the amount of revenue which the tax would yield, and it is likely to be adopted as one device for escaping the direct levy upon net incomes."

If a bill of this nature should become a law, the disastrous result could not be estimated, but it is safe to say that it would certainly force over one-half the manufacturers of proprietary articles out of the business. It is wise to anticipate such legislation as this, and we cannot be too well prepared for an attack of this nature.

There is no time for delay! The consequences brought about by the stamp tax placed upon medicines at the close of the war fully demonstrates what we may expect if this new law should be permitted to pass.

Let me urge upon you the necessity of telegraphing or writing at once to your Representative in Congress and United States Senator, and requesting them to oppose such a measure as the one in question as strongly as possible.

Information in regard to inimical legislation is hereby solicited, and any suggestions you may care to make in reference thereto will be duly appreciated.

My absence from home has prevented earlier attention to this matter.

Yours respectfully,

JOHN HODGE,

Chairman committee on legislation, Association of Manufacturers and Dealers in Proprietary Articles of the United States.

A mine has been discovered in Pennsylvania which is said to produce Venetian red, amber, ochre, sienna and several shades of brown colors. A rainbow of the carboniferous age probably got mixed up with the earth during prehistoric times.

WHAT NEXT?

Now that the holiday rush is over the question with many druggists will be, "What next?" The answer to this inquiry is, "reasonable goods." Many articles of this character have perhaps been side-tracked lately, and their places taken for toilet articles, perfumes, fine stationery, candles, etc. It is believed that the holiday trade was not so bad after all, as many predicted it would be; however, there are many druggists who have a good many things left which Santa Claus did not seem to want, and these should now be cleared away and preparations made to take advantage of the more or less serious results which follow in the wake of the innocent dissipation of the holiday season, and the process of swearing off. The prophet of the drug store intimates that the cough medicine market is going to be firm, basing the prediction upon the fact that the most disagreeable part of our winter weather is yet to come. Assuming that this is true, it behooves the drug trade to be fully prepared for the campaign.

Every druggist carries in stock 25 different brands of cough medicine (more or less). This stock would make an excellent window display, and with daily attention and occasional rearrangement will last for a long time, and the opportunity for calling attention to such a display by means of varied advertising is one that should not be disregarded. Many people never think of doctoring an ordinary cold until their attention is called to some means for doing so. Then there is hot water bottle, atomizer, and chest protector trade. There are too many cold feet in this country and lots of people look upon this condition as a natural and necessary evil. The druggist should preach hot water bottles, and put the goods where people can see them. Make prices to meet the department store (people won't buy unless you do), and make it a point to sell all your stock of this kind this winter. Don't save any for next season. It will not pay. Do not think that trade is falling off because people spent a little extra during the holidays. They will need drugs just the same, and it is the duty of the wide-awake druggist to call their attention to what they need.

"Tomato squash" is the name which the Caterer gives to a new beverage which is in vogue among that class of society which live well, have the gout, and regard "two bottles as the proper amount of liquid to be taken at dinner. The new drink is made by squeezing the juice of a couple of fully ripe tomatoes into a large glass and then filling it up with seltzer water. It is not altogether bad to take and perhaps the druggists might include it in the list of next summer's soft drinks.

Lochman's Dose and Price Labels, advertised on another page in this issue, may be well considered as belonging to the class of indispensables which should form a part of every well regulated pharmacy. This collection of labels includes nearly everything in the line of materia medica, and gives formulas for many official and unofficial preparations. The labels may be preserved in book form as a valuable work of reference, and also utilized as a price book, or they may be cut out and attached to shop bottles and other containers.

BOOK REVIEWS.

The French Doctor's Book.*—The real character of this book is not revealed in its title, it being a collection of 1,200 prescriptions compiled from those used by eminent European specialists in the treatment of various diseases and complaints. The compiler, Dr. N. Gallois, Laureate of the Institute de France, etc., has done his work well, and the formulas selected cover a wide scope of medical practice and are of interest not only to the practitioner, but to the pharmacist as well. Technical terms and signs have been avoided and the formulas expressed in language easily comprehended. The book is, upon the whole, a commendable one, fairly well arranged, and contains a copious index, by means of which the appropriate treatment of any of the diseases noted may be readily found.

A New Pathology and Treatment of Catarrh is the title of a pamphlet by Seth Scott Bishop, M. D., reprinted from the Journal of the American Medical Association. The author very intelligently discusses the uric acid theory in the causation of catarrh, and outlines some very important points which should be taken into consideration in the treatment of the disease.

Ueber das Verhalten der Allylmaionsaure, Allylessigsaeure und Aethylidenpropionsaure, Beim Kochen mit Natronlauge Beitrage Zur Kenntniss der Propyldenessigsaeure, is the title of a pamphlet presenting the inaugural dissertation before the faculty of Strassburg University for the degree "Doctor Arbeiten," by John G. Spenzer, of Cleveland, O.

The Child, Physically and Mentally.—A pamphlet of 155 pages, one-third of which is devoted to a general consideration of hygiene, and its relation to health, particularly the importance of hygienic surroundings and correct living in the rearing of the child. The remainder of the book consists of suggestion and advice to the mother, dwelling upon the necessity for proper sanitary surroundings and the choice of foods. As a whole the book is an essay very general in character, rather than a work from which much practical, specific and detailed information is to be gleaned. However, the mother will find its advice reasonable and worth following. Its several chapters are: History of Hygiene, What Hygiene Includes, The Infant During the First Few Weeks of Life, Use of the Nursing Bottle to Supplement the Mother's Milk, Bathing and Washing, Rearing Entirely by Hand, The Nursery and the Infant's Further Development, Education of the Aesthetic Sense in the Nursery, Further Development of the Healthy Child, Children's Diseases. It is written by Bertha Meyer, translated by Friederike Solomon, and published in America by M. L. Holbrook Co., New York. Paper, 50 cents.

The consumption of ivory for billiard balls is something enormous. At the World's Fair was displayed a photograph of a pile of 20,000 billiard balls, which represented the ivory obtained from 2,000 elephants.

*The French Doctor's Book.—A collection of 1,200 Favorite Prescriptions by the most eminent Foreign Physicians, Compiled by Dr. N. Gallois, Laureate of the Institute de France, etc. English Translation, cloth, 124 pages, price \$2. Boston, W. Von Bergen.

 22,757—Nasal Tube.—Alfred G. Ely, New York, N. Y., assignor of two-thirds to Charles Christopher Ely and Frederick Ely, same place.
 22,835—Bottle.—Edward M. Cone, Newark, N. J.

THE MARKETS.

New York, December 25, 1893.

The drug market at present is in a state of quietude and, as in previous years, the last two weeks of the year have been devoid of interest and business. It was thought by some that, owing to the depleted condition of stocks, business would pick up a little, even in the face of stock taking, but they have been disappointed. Prices continue to have a slight upward tendency, and the dealers offering inducements to stimulate trade are few, all seeming to be of the opinion that business will be replenished at prices which the absolute necessities of the buyers will serve to stiffen.

That prices will continue to advance there is no doubt, owing to the fact that, for the past few months, many articles have been sold below the cost of production or importation, and dealers will seek to reimburse themselves for the losses and sacrifices they have been compelled to suffer.

The drug trade comes in for an unusual share of attention in the revision of the tariff, and considerable fault is being found with the feature of the Wilson Bill, which restores ad valorem duties. The drug section of the New York Board of Trade held a meeting on December 14, and unanimously passed a set of resolutions condemning the ad valorem rates, and advocating specific duties. The resolutions were forwarded to the Ways and Means Committee at Washington, and to Chairman Wilson. It was claimed that ad valorem duties would have a tendency to increase the importation of inferior goods. The committee having this resolution in charge was composed of the following gentlemen, all well-known as large importers of drugs and chemicals: Chairman, J. H. Stallman, of Stallman & Fulton, Theodore Welcker, of Merck & Co., William S. Mersereau, of W. H. Schieffelin & Co., Victor Koechl, of Schultze-Berge & Koechl.

OPIMUM.—Has advanced though the demand remains inactive and without interest. As this staple seems to have touched its lowest point, indications are favorable for a decided advance. The rumor that opium is in the hands of manipulators and was reduced for the purpose of speculation seems to be entirely without foundation. The ruling quotations at present are \$2.20 to \$2.35 in case lots.

POWDERED OPIMUM.—Also shows a slight advance and is now quoted at \$3.15 to \$3.25 in bulk.

QUININE.—Is the one active article on the list; buying continues large and the amount of contract orders fully up to the average. The long looked-for advance in manufacturers' prices has come at last. The foreign manufacturers, through their agents, have made an advance of 2½¢ and the American manufacturers have made an advance of 3¢. The following schedule is now offered by the representatives of foreign manufacturers: 100-oz tins, 27½¢, 50-oz tins 23½¢, 25-oz tins 24½¢, 5-oz 27½¢, 1-oz 29½¢. In the usual jobbing quantities. The prices of American manufacturers are ¼¢ above these quotations. Prices are expected to advance after January 1st.

ALCOHOL.—Is without change in quotations; only a light business is being done: \$2.24 to \$2.25 with usual discounts.

ERGOT.—Only a small business in a jobbing way is being done at the nominal quotations: German 32½¢ to 35¢, Spanish 37½¢ to 40¢.

BLEACHING POWDER.—Is without special features of interest. Prices remain without change at \$2.37½ to \$2.50 in casks.

ONALIC ACID.—Has advanced. The foreign market has assumed a firm position and 7c to 7½¢ in casks seems to be the inside prices.

CHLORATE POTASH.—The market here has not advanced in sympathy with the market abroad and quotations remain at 14½¢ to 16c in kegs.

BORAX.—Is without change at former quotations.

SALICINE.—Has shown a further advance, and is now offered at \$1.75 to \$2.25.

CITRIC ACID.—Has declined. Manufacturers' prices remain at 45¢, but goods in outside hands are freely offered at 41c in kegs.

COCAINE.—Is in good demand. Prices are held from \$4.75 to \$5.50.

MENTHOL.—Is scarce. Stocks here are very light and the market continued firm with prices ranging from \$5.00 to \$5.50.

ROCHELLE SALTS.—This article suffers somewhat from the hand to mouth policy of the jobbers and orders given are small and for immediate wants: 19c to 20c in barrels is asked.

CREAM TARTAR.—Is in small demand only, with an inclination to cut prices in the west, goods being offered at 18c f. o. b.; lowest quotations ruling here 19c to 20c.

TARTARIC ACID.—Is meeting with good demand at 22½¢ in barrels.

FLAX SEED.—Owing to the recent cold snap has taken a fresh start and orders are good considering the time of the year; prices quoted: \$5.25 to \$5.50 for regular barrels of 182 lbs. Ground is offered at 25¢ to 2½¢ per lb.

CACAO BUTTER, BULK.—Foreign is very scarce, but a number of arrivals are expected. Prices remain without change: 35c to 40c.

QUICKSILVER.—Is without change at previously quoted prices.

CARBOLIC ACID.—Is dull and without business. Prices vary as to quality and brand: 20c to 26c for pounds in cases seem to be the average prices.

GLYCERINE.—Is passing out in good quantities and a decline in price is noticed. Prime goods can now be had in drums at 13½¢ to 14c, 50-lb cans in case lots 14½¢ to 15½¢.

COD LIVER OIL.—Is now in good active demand, and nothing is being offered below \$20.00, the best goods being sold at \$22.50 to \$23.50.

GUM CHICLE.—Is easier and only a light demand is noted: 30c seems to be the ruling quotation.

GUM ASAFOETIDA.—Stocks still remain small and a number of orders placed several weeks ago remain unfilled. Inquiries at headquarters show no likelihood of an immediate change. Owing to the absence of strong demand, prices remain without change.

GUM TRAGACANTH.—A very firm market with a slight advance in prices is shown, and some business has been done in prime goods.

CAMPHOR.—Remains dull. Manufacturers' prices remain at 45c to 46c for barrels and cases, but in second hands the prices can be shaded.

BALSAM FIR, CANADA.—Is high and scarce, best goods are obtainable at \$3.75 in barrels, \$4.00 to \$4.25 by the gallon.

BALSAM COPAIBA.—Is higher. The market is very firm and prices show an upward tendency: 40c to 45c for Central American is asked.

BALSAM PERU.—Is firm and while prices show a tendency to advance no changes have taken place as yet. Prices asked are \$1.60 to \$1.75.

WITCH HAZEL.—Is in active competition and the number of different brands in the market are offered at all kinds of prices, but for best grades 15 per cent alcohol, 55c to 65c is asked.

OIL CUBEB.—Is weaker and the present low price of the berries favors buyers: \$2.00 to \$2.40 is asked.

OIL PEPPERMINT.—Stocks in first hands are held at fancy prices. Producers do not seem anxious to sell or to make concessions to stimulate active buying, in consequence of which, little or no business is being done, while further advances are talked of as likely to take place. The following prices seem to be inside quotations: Western \$2.55 to \$2.65, New York, \$2.75 to \$2.85, H. G. I., \$3.20 to \$3.25.

CUREB BERRIES.—Continue dull and prices are low and in buyers' favor.

IPECAC ROOT.—Is without active interest or change in price: \$1.45 to \$1.55 is quoted.

SARSAPARILLA ROOT.—While no advance has taken place, the market is firm, and no new lots are known to be in transit, or on the way here: 10½¢ to 11c is quoted.

ORRIS ROOT.—The firm tone of the market abroad and the recent advances that have taken place there, have caused the market here to assume a firmer tone; no advances have taken place as yet, but it is likely prices will advance in sympathy with the foreign market. Florentine is held at 28c to 30c, Vienna at 16c to 20c.

RHUBARB ROOT.—Remains without change, only a light business is being done.

CARDAMOM SEED.—Prices have advanced about 30 per cent all along the line on account of the small stocks on hand. Prices range from 75c to \$1.25 for the different grades.

CANARY SEED.—Shows greater activity on the part of buyers and sellers and a fair business is the result. Smyrna is quoted at 25¢ to 31¼¢. Sicily at 3c to 4c in bags.

CELERY SEED.—Is lower. The market is quiet and without interest, but holders have made no concessions to interest buyers. 20c seems to be an inside quotation for jobbing quantities.

HEMP SEED.—Is easier in supply, several large lots having arrived, and prices are lower as a result. Russian seed is offered at 3c to 4c.

Under date of December 16th, 1893, Rosengarten & Sons, of Philadelphia, announce the following advance in sulphate of Quinine in lots of 50 ounces or more: 32c per oz, including 1-oz vials; 30c per oz, including 1-oz cans; 27c per oz in 5-oz cans, 26c per oz in 25-oz cans, 25½¢ in 50-oz cans and 25c per oz in 100-oz cans. The Bromides of Ammonium, Potassium and Sodium in bulk, 50-pound lots are quoted at 47c, 38c and 42c per pound, respectively.

ALBERT B. PRESCOTT.

VERY few pharmacists in the United States are unfamiliar with either the name or the features of Dr. A. B. Prescott. Nearly every town numbers among its druggists someone who has profited from his teachings in the class room or had personal meeting with him at pharmaceutical conventions. His best work has been in the service of the Department of Pharmacy of the University of Michigan, which he has brought to be the capstone of the pharmaceutical educational structure, and in which connection he has ever and consistently sought the advancement of the profession by providing only the best qualified followers of it. His influence thus exerted is sufficient reason for his reputation, though others are not lacking.

Albert B. Prescott was born in Hastings, N. Y., December 12, 1839. He followed scientific studies during his early manhood, and at the mature age of 30 he entered upon the study of medicine, obtaining his degree from the University of Michigan in 1864. Then receiving a

commission as surgeon in the army, he served till late in 1865, when he returned to his alma mater, having been appointed assistant professor of chemistry. In 1870 he was made full professor of organic and applied chemistry and pharmacy. A year prior the Department of Pharmacy had been organized and the position of dean of that department, which was then given him, is still his. Later, in 1880, he assumed directorship of the chemical laboratories of the university.

There is little need to enumerate what has been accomplished for pharmacy by Dr. Prescott. In his function as an instructor the influence of his high ideals is ever being extended by his students. As a chemist, he is favorably known abroad, and at home is considered authority, particularly in sanitary matters, and he has had an extensive forensic experience.

He is the author of several works, accepted as standards, the more notable ones being "First Lessons in Qualitative

Chemistry," "Chemical Examination of Alcoholic Liquors," "Outlines of Proximate Organic Analysis," "Qualitative Chemical Analysis" (jointly with S. H. Douglas), "Prescott's Organic Analysis," etc. His contributions to current pharmaceutical and chemical literature have been voluminous and invariably characterized by thoughtfulness and careful utterance. In pharmacy alone, he has served well in associations, in which he has held frequent official positions, and on the Pharmacopœia and its committee of revision has given valued aid and counsel. In appreciation of his mental equipment and scientific accomplishments, numerous honorary positions have come to him. He has occupied the president's chair in the American Association for the Advancement of Science and in the American Chemical Society, is a fellow of the London Chemical Society and a member of numerous pharmaceutical organizations at home. Pharmacy has no truer friend and abler exponent than he.

ENTERED AT THE DETROIT F. O. AS SECOND-CLASS MATTER

ESTABLISHED 1887

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

EDITORIAL.

WHAT THE DOCTOR THINKS.

For fatuous, crass ignorance the following editorial utterance by a medical exchange is worthy the award of a World's Fair medal. Hear it: "It is the methods used, far more than the ingredients, which make the fine pharmaceutical products now so much used of such great therapeutic worth. The formulae used by the manufacturing chemists are generally published for the information and guidance of the profession, but the methods which they employ constitute their legitimate secret, and the druggist is extremely foolish to think that, even with the same formula, he can make in a few minutes, without any previous instruction, a remedy the equal of one which has been for days and weeks undergoing the various steps in the process of manufacture."

THE LANOLINE CASE.

The importance of the suit lately instituted by the owners of the Lanoline patent in England to restrain an English firm from manufacturing a purified wool-fat, mixing it with vaseline and selling it under the name, "Anaspaline," is so great that we publish in full in our trade department the decision of the English judge upon the case. The suit was conducted with great ability upon both sides, and shaming flights of the legal and pharmaceutical professions argued the question of wool-fat from the days of Dioscorides up to the present time. As hydrous wool-fat, "the purified fat of the wool of the sheep mixed with not more than 30 per cent of water," is now one of the official preparations of the United States Pharmacopoeia, the decision will be read with more than ordinary interest. Its bearing upon commercial interests, and the precedent which is thus established for possible application in similar cases, are points which are naturally brought to the front, and they are worthy of the careful attention of all interested in pharmaceutical matters.

GASTRIC SODIA.

Surely the ways of the "Black Pepsin" swindler are devious and almost past finding out. The latest dodge is to have Aunt Mary Soandso, of Grassville, or some other locality, write to country editors telling them of the wonderful results which she has obtained in her butter laboratory by using "Gastric Soda." Aunt Mary usually succeeds in making the editor think that she is a good old soul with a benevolent turn of mind, and he prints her letter in the same column with communications from Taxpayer and Old Subscriber. The local druggist then appears upon the scene in his conventional stage costume, and as he slowly approaches the footlights, it is noticed that

he bears in his hand a circular from the United States Salt Co., New Concord, O., extolling the virtues of "Gastric Soda" as a means of increasing the yield of butter. The advertising which is being done in the newspapers is referred to, and the druggist is advised to lay in a stock of the stuff. As the spectacle of two of the most prominent citizens of a community kicking themselves is not pleasant to contemplate, the advice is offered that the editor and druggist both had better leave compounds of this character severely alone, if they wish to avoid an unpleasant experience.

OWNERSHIP OF THE PRESCRIPTION.

There has been little of precedent for a guide in legal cases involving the ownership of the prescription. But a decision recently handed down by the Supreme Court of Missouri seems to settle the matter, for that state, at least. The case in question involved the constitutionality of the law requiring druggists to carefully preserve all prescriptions compounded by them or those in their employ, numbering, dating and filing them in the order in which they are compounded, and producing the same in court or before any grand jury whenever lawfully required, neglect or refusal to do so being deemed a misdemeanor. Inasmuch as this law requires the prescription to remain in the custody of the druggist, it would seem that the customer and the physician have no legal right to it, for the decision upheld the law. A case in Detroit some months ago was decided in a lower court in favor of the customer, though had it been carried to the Supreme Court the result might have been otherwise. But the Missouri case is interesting from another reason, in that it is held that druggists cannot be required to produce all of the prescriptions compounded by them or filed by them during any specified length of time, however short, to be inspected and inquired into by the grand jury, no matter what ailments they may have been prescribed for, or for whom, as that would be an intrusion upon their private affairs and business, and without warrant of law. A subpoena to compel the production of prescriptions, even in a proper case, should describe them with some kind of particularity.

DRAW THE LINE.

This is the season of the year when the retail druggist is groaning under an avalanche of patent medicine almanacs, which are sent to him to be distributed for the purpose of advancing the sales of various remedies which their pages describe. He is supposed to employ himself diligently in the distribution of such printed matter to the public, or in other words, to assume the onerous position of general advertising agent for the introduction and sale of the goods which these almanacs so strongly recommend.

It is a well known fact that many of the goods thus advertised are for sale by cutters and outside dealers, which deprive the druggist of his legitimate profit, and our advice to druggists is to positively refuse to display in their stores, or distribute, the printed matter of any patent medicine manufacturer whose goods are sold at cut rates in his locality. The time has come when the druggist should not be used as a cat's

paw for pulling these cutters' chestnuts out of the fire. We know of one druggist who recently wrote to a manufacturer in response to his solicitations for a supply of calendars, as follows: "We do not want any calendars or other printed matter, nor do we intend to distribute any more printed matter for the goods handled by cutters."

This is the position that every druggist should take, and he need only apply the rule to the sales of such goods by cutters in his immediate locality. If such goods are handled by cutters in your locality positively refuse to have anything to do with furthering their sale. There are plenty of reputable manufacturers of patent medicines who will do all they can to prevent their goods from being handled by outside dealers and sold at cut rates, and if the druggist wants to know on which side his own bread is buttered, he will confine his efforts to the distribution of only such printed matter as comes from manufacturers who protect the retail drug trade.

THE "C. H."

While the phrase "calamity howler" is one of comparatively recent coinage, the character which it represents is one of decided antiquity. In addition to bolus, the much-afflicted Job was compelled to give him, or several of him, audience, and listen to his doleful presentation of views upon (perhaps) the hardness of the times, the tariff and free coinage in the land of 'Uz. But we remember that Job finally pulled through with all his troubles, and if we can credit the theory that history repeats itself, the lesson should not lose its application to our modern instance of 1893. The calamity howler has been our unwelcome guest for the last six months. While we did not welcome his coming, we can with hearty good will speed his parting. While we did not go into hibernation with our usual amount of fat, and will probably emerge next spring in an emaciated condition and rather wabbly about the knees, we have not lost our characteristic American energy and will be prepared to make hay when the sun next comes our way. In summing up accounts for the year 1893, the fact cannot escape attention that, while the disasters are given due prominence, there is an universal expression in undertone that we are badly hurt, but not near as badly as we expected. It is beginning to be realized that the earth is pretty well provisioned for a siege after all, and that the fiat, "Let there be a panic" (and there was a panic), which was sent forth last summer was a mistake and should not have been issued, and there now seems to be a decided inclination to reverse this decree to "Let there be good times." But we cannot overlook the fact that the calamity howler has irritated us with facts during his disagreeable stay. He has gleefully directed our attention to trouble in Australia, in Argentina, in England, in Germany, and to our own crowds of unemployed. He has sat at the fireside of the druggist and talked "cut rates" and general demoralization with great vigor and exultation, never mentioning the fact that wheat only costs us sixty cents a bushel. But we have no time to listen to him further, we are too busy just now, and expect to have all our time fully occupied this year.

Our funny men with pictorial abilities have depicted 1833 as a decrepit old man making such haste as he can to disappear before the new drop curtain is rung down. Let poor old "C. H." join him. He may find room in among the great crowd of played out years to stand and blow his battered horn to an audience to his liking.

PRICES IN ADVERTISEMENTS.

It seems to be the generally accepted opinion among advertising experts that the advertisement from which direct returns are to be expected is the one that gives prices. The day has come when the ordinary merchant finds it to his advantage to mark all his goods in plain figures, and he carries the idea to its uttermost limit by placing his leaders in the show window, or even on the pavement, and covering them with price placards sometimes as large as the goods themselves.

He knows that a modest announcement, informing the public that his goods are the best and that they are sold very cheaply inside the store, or that he has an exceptionally fine lot of good and cheap shoes on a counter up on the third floor back will not attract even a casual glance from the passer by.

The same idea will apply to the means employed to sell goods through an advertisement. The man who entered a store to inquire the price of an ordinary appearing vase which he saw in the window looked somewhat sheepish when informed that the price was \$500, and he really thought that the clerk was endeavoring to stifle a smile while noting his discomfort. The consequence is, he now has an aversion to entering that store, even though the feeling is so slight that he can hardly admit that it exists.

A similar instance is that of a druggist, who, upon reading a clever description of an apparatus for some branch of chemical research, became quite enthusiastic, wrote the manufacturers congratulating them on their enterprise in manufacturing such an affair, and informed them that he was very desirous of obtaining such an instrument. The return mail brought him the information that the price of the article was \$350, or about one-third of the druggist's yearly income. The manufacturers have not heard from the druggist since, and he performs his daily vocations with the air of a man who has run against a confidence game. If questioned, he would perhaps deny the existence of any feeling, and even if he admitted it he would despise the triviality of the causes which produced it, but at the same time his enthusiasm has been dampened to a degree which will require considerable heat to again be raised to the inflammable point.

The trouble of writing a letter to obtain prices on an article which has attracted attention, will often disturb a finely adjusted scale which evenly balances with pans which are loaded with two questions, viz.: "To buy?" or "Not to buy?" and cause the latter to dip downward in a very decisive and emphatic manner. The moral to be derived from these incidents is quite obvious—give prices. With these before him, a customer can decide quickly if he does not want a thing, and if he does not decide quickly he will have something tangible in his mind to turn over in arriv-

ing at a decision. If he has to wait a week before receiving quotations, he may have lost all interest in the matter by the time they arrive.

SPECIFIC GRAVITIES OF THE U. S. P.

The table of specific gravities of pharmacopoeial preparations, which is presented in this issue is, or should be, very acceptable to the pharmacist. But there are those who will question the value of such a compilation, hence a word of advice as to the proper application of the table is not amiss. In tests for identity, purity and strength of very many chemicals and galenicals the specific gravity is relied on greatly, in all liquid preparations furnishing an indication of the proportion of dissolved matter present. There are many preparations of the Pharmacopoeia which should be made exactly of the specific gravity prescribed. For instance, if the solution of chloride of iron be of too low a specific gravity, it is evidence that it is not of the proper iron strength. Upon dilution with alcohol to form the tincture of chloride of iron, the error is made greater and more serious. Then, in the neutralization of an acid with an alkali, particularly in large operations, it is very essential that the exact strength of both acid and alkali be known, and this is most easily effected by taking the specific gravity. Then again, if at one time in making a pharmacopoeial preparation, the product be of the proper specific gravity, and at another time the same preparation, made from apparently the same quality of ingredients and after the identical method, but prove of deficient specific gravity, this fact is in itself evidence of something wrong. If, say, certain fluid extracts be always made after the same formulas, but the products vary within wide limits as regards specific gravities, the presumption is that the qualities of the crude drugs or the strengths of the menstrua vary. Specific gravity can be employed in many ways as a check upon manufacturing processes, as a test for the quality of supplies. The druggist should, invariably take the specific gravity of every barrel of alcohol and every carboy of ammonia purchased, and he should always see that any preparations he manufactures are within the requirements of the Pharmacopoeia. Those who are accustomed to taking specific gravities, as above indicated, will, at once, appreciate the value of the table, and those who have not given this subject proper attention, would find it to their material and financial interest to institute a reform in this respect. A difference of a very few per cent in the strength of a barrel of alcohol or a carboy of ammonia may occasion loss of quite a considerable sum, and the aggregate of many leaks of this nature is by no means to be considered.

MONGREL SCIENCE IN THE A. P. A.

At the recent meeting of the A. P. A. the chairman of the section on Scientific Papers offered contributions showing the results of his examinations of oil of cloves and oil of turpentine. From an imposing array of figures, claimed to be those arrived at from his own personal analyses and tests, he drew the conclusions that the Pharmacopoeial requirements for oil of cloves are altogether unsatisfactory, and the various well known tests to deter-

mine the quality of oil of turpentine he commented upon in a similarly adverse manner. These papers were published in full by a number of pharmaceutical journals, as was natural, for it is not expedient and seldom even possible for the editors of journals to establish the correctness of the assertions in papers of this character. But, as was equally natural, other chemists, of experience in valuing these particular products, at once took occasion to examine the quoted figures very critically, with the result that readers of pharmaceutical literature have been regaled with some astounding statements to the effect that the author of these papers was not competent to conduct the analyses in question, and farther than this, it is not only implied, but plainly stated, that he did not obtain the figures quoted, one critic insinuating that they were falsified or wholly fictitious. While we do not believe that any particular advantage is to be gained by a wider agitation of this unpleasant matter, believing it best for the party attacked to fight his own battle with his critics and establish, if he can, the statements he promulgated, there is one feature which has a greater than a mere personal significance. This is that the American Pharmaceutical Association should exercise far greater care in the admission of papers which it is afterward to publish to the world under its seal of approval. One of the critics reasons that although it is believed to be the policy of the A. P. A. to disclaim any responsibility for the correctness of papers read at its meetings, it is high time that some censorship or control should be exercised over their publication in the official proceedings. That there should be presented papers of such a nature as those concerned in this controversy must prove not only derogatory to the scientific aims and status of the association, but very humiliating to all who desire to cherish and promote the higher ideals and interests of American pharmacy.

These critics have made out a very strong case against the author of these two papers, and, so far, we have seen no rejoinder from him or attempt to controvert their opinions. If he be unable to answer their attacks, certainly their strictures upon his methods and upon the laxity of the A. P. A. in regard to the acceptance of papers are well warranted. The pharmaceutical world has a right to look upon the A. P. A. as authority, and naturally accepts with very little question papers which are given out in its proceedings. The A. P. A. is supposed to represent the higher thought and progress of the profession, and it is certainly humiliating to discover that certain so-called scientific papers are really bosh.

We are willing and anxious to put the most charitable construction upon this matter, but it is certainly unfortunate for the author of these two papers that he has come into conflict with men who have made it their special work to become wholly familiar with the methods of valuing products of this particular nature. The general chemist, whatever be his ability, is not competent to test volatile oils without special training in this direction, and, if this chemist does not possess this special qualification, he was foolish to step in where "angels fear to tread."

PHARMACEUTICAL EDUCATION AND REQUIREMENTS IN AMERICA.

The address of Mr. Martin, printed in full in this issue, wherein he offers to English hearers the results of his observation of matters pharmaceutical in the United States, has provoked much interest on this side of the Atlantic, and the discussion is apt to become more animated the wider his views are disseminated. Mr. Martin is to be congratulated on his manner of speech, which is frank, outspoken, free from any suspicion of personal feeling, and offered with an evident desire to present the best of things, as he saw them. The American is not particularly thin skinned, and he very often is really pleased to have his faults and shortcomings pointed out to him, but he always wants to be sure that they are really faults and shortcomings in fact rather than in the mind of his accuser. A number of Mr. Martin's strictures are well warranted, we must admit, by the conditions existing in this country, others are a little too severe, resulting from observation, which could not, under the circumstances, have been other than rather superficial. His criticisms on the whole, will certainly be useful.

We may be a little hurt by his evident non-appreciation of railway facilities in the United States, but we are consoled by the belief that very probably he was the holder of some World's Fair excursion ticket, rather than of a pass upon the "Exposition Flyer," which carries the traveler from New York City to Chicago in less than twenty hours, a period of time which, in England, we are told, would be sufficient to run a train clear off that little Island. Then, too, he doesn't like the soda fountain and cigar case in the drug store, but the American druggist is a very accommodating gentleman, and, as the public want these articles, he is very ready to supply them. The United States is a new country, it celebrated its centennial less than twenty years ago, and the quadricentennial of its discovery was the occasion of last summer's great celebration at Chicago. Thus it is that conditions here have not those features of solidity and unchangeableness which characterize many of the British Institutions, and pharmacy is not exempt in this respect. Then, this is a vast country, and the conditions existing in the far west cannot be justly compared with those obtaining in the more cultured east. Business habits and methods of the south differ from those of the north, and it is not surprising, though perhaps it be regretted, that Mr. Martin finds considerable lack of uniformity in the laws regulating the practice of pharmacy and in the methods of teaching the art.

His estimates of the boards of pharmacy are, we believe, lower than they would be with fuller acquaintance, and he seems also to underestimate the support that our pharmacists in general give to the colleges which require extended laboratory instruction (and there are such). He is justified in his belief that the boards of pharmacy are laboring under a disadvantage in that they have no adequate laboratory facilities for ascertaining the candidate's knowledge of practical dispensing pharmacy. This is a lack which all the boards recognize, and which several of them have nearly or quite overcome, and the others are

working to bring about the needed reform. The British pharmacist is working under conditions which cannot be compared with those obtaining in the United States. Here, a fundamental principle of the government is that every man has a right to enter upon any profession or any calling, provided he shows himself competent to discharge the duties of that calling, but, in drafting laws to regulate the professions of medicine and pharmacy, the result of many men of many minds has been and is that the ideal is made very hard of attainment, though it must be admitted by all that, even under the restrictions which exist, pharmacy has shown a steady advancement and improvement.

Readers of Mr. Martin's address will be able to estimate the value of his criticisms, which will certainly be beneficial in the main. There will prove to be no lack of defenders of American pharmacy and, for the present, we leave the matter for the consideration which is sure to be accorded it. All will await, with interest, Mr. Martin's forthcoming address to the society of which is the president, when he promises to tell what he thinks of British pharmacy, and, perhaps, we will find that there are some things in the profession as practiced in the mother country, which are susceptible of alteration for the better.

ADVANTAGES TO THE PHYSICIAN OF DOING HIS OWN DISPENSING.

Our medical exchanges have opened their columns to a liberal discussion of this question and have presented contributions both weighty and flighty. But a summary of the advantages has been drawn up from which we learn that they are as follows: 1. Making a physician more independent. 2. Offsetting the practice of substitution among certain druggists. 3. Securing pure and fresh drugs. 4. Preventing the refilling of prescriptions without the physician's authority. 5. Shutting of the practice of counter-prescribing and selling of patent medicines. 6. Centering all profits upon the physician. 7. Affording cleanliness in the preparation of medicines. 8. Educating the physician in practical pharmacy. 9. Inspiring confidence in the patient. 10. Checking the growing use of proprietary medicines by the medical profession.

Some of these advantages we would not attempt to deny, especially do we believe that the physician has all of justice in his opposition to substitution, refilling of prescriptions, and counter-prescribing. We would take exception, however, to some of the other conclusions. The physician is not made more independent. On the contrary, he is in danger of being forced to neglect medicine for pharmacy, for, if he has a good practice, it would necessitate employment of all his time to compound the required remedies and it is obvious that he could not do justice to both or either. We venture to deny, too, that he would be sure of getting pure and fresh drugs. Rather, in most cases, he would get inferior ones. The druggist who supplies a dozen doctors and innumerable customers assuredly has better advantages for purchasing than has the individual physician who must buy in very small lots alone. As to profits to the physician, these are not always realized. He may buy some things cheaper through purchasing larger quantities than his re-

quirements really demand, but the loss on overstock usually more than offsets what he gains in prices.

Cleanliness in dispensing would not be attained, as this comes only through much practical experience, and if any physician will attempt his own dispensing, he will quickly discover that cleanliness, accuracy and neatness are out of the question if he must carry on his pharmaceutical work between professional calls and must keep his instruments clean and in their proper place ready for instant service. Some of our druggists are not any too neat in their work, but even the worst are better in this respect than the physician, we fear, would prove. That by dispensing his own remedies the doctor would become versed in practical pharmacy is a ludicrous assumption, and we would ask what of the results to the patient while the physician was becoming educated? Medical colleges give no training whatever, worthy the name, in pharmacy, and we do not envy the lot of a physician who attempts to pick up this knowledge while in active medical practice. The next quoted result, that of inspiring confidence in the patient, would be far from following as a natural corollary. Rather, were the patient to discover that the physician is picking up facts in practical pharmacy, his confidence would be more prone to leave him than to be increased.

But we are one with the physician in his desire to diminish the use of proprietary preparations and to decrease the practices of counter-prescribing and of substitution by unworthy, unprincipled druggists. The refilling of prescriptions is a matter very hard to adjust. In the majority of cases the physician has the remedy in his own hands by directing that the prescription be not refilled without special order, but, many times, the druggist finds himself placed between the upper and nether millstones, represented by the physician and the patient, the latter insisting that the prescription is his to do as he chooses with.

A contributor points out a number of inaccuracies which he has discovered in the new Pharmacopoeia. No one expects this work to be absolutely without error, and that so few have been discovered in it is really a matter of congratulation. Very few of serious import have so far been pointed out, the majority of errors being of a nature not to lower the value of the work as a practical guide.

RELATIVE TO THE WILSON TARIFF BILL, the Chemist and Druggist takes exception to the ad valorem system of duties. Our contemporary believes that where such duties are in force, goods are persistently declared below their true value, and, even in countries where the officials have power to purchase articles compulsorily from the consignors at their declared prices, if it appear that they have been declared at less than their true value, the duties which arise tend to great complication. Then it is argued that many goods are liable to sudden price fluctuations, which render the equitable imposition of ad valorem duties rather difficult. With the press crying down specific duties on the one hand and ad valorem on the other, it is not difficult to imagine the mental perturbation which must affect the ways, and means committee.

THE PHARMACEUTICAL MEETINGS IN CHICAGO IN 1803, WITH SOME NOTES ON AMERICAN PHARMACY.*

By N. H. Martin, F. L. S., F. R. M. S.,

President of the British Pharmaceutical Conference, Delegate from the Pharmaceutical Society of Great Britain to the American Pharmaceutical Association and to the seventh International Pharmaceutical Congress at Chicago.

I had, as a member, determined to attend the meeting of the American Pharmaceutical Association at Chicago, and to this circumstance was due the fact that the council of the Pharmaceutical Society did me the honor to appoint me as one of the delegates to that body, and also to the International Congress which was to meet in the same city immediately after. Through the courtesy and acquiescence of my distinguished colleagues, Mr. Carteighe and Mr. Martindale—who are always with you here in London—who have been invited to give you an account of my journey to Chicago and of some of the impressions which I have received concerning pharmacy in America. This was my second visit to the United States, and many of the ideas and opinions which I had formed as the result of my first visit have been altered or modified by my second, so that without making any claim to know the minutiae of the practice of pharmacy in a country so vast as the United States, I do venture to think that the opinions I have formed are based upon a reasonably accurate acquaintance with, and interpretation of, the facts of the case and of the conditions which exist. I have had the pleasure of visiting most of the large cities east of Chicago, as well as some of the smaller towns. I have visited and gone carefully over the works of several wholesale and manufacturing firms, and have observed from the outside and the inside many hundreds of retail pharmacies. I have had the privilege of hearing the discussions at the various pharmaceutical meetings which were held at Chicago, and have had conversations with professors and pharmacists from a great number of the states and cities of the Union. From these several sources I have gleaned certain facts and formed opinions, but in stating them to you I shall almost without exception refrain from mentioning the names of states, colleges, and persons, so that my remarks may be as free as possible from personal considerations, whether I appear to admire or criticize.

Before I touch on pharmacy just a word as to the journey, as to travel in America, American scenery and, above all, American hospitality. The ocean journey has been so often described that I can scarcely add to it. A journey to New York is no more exciting than a trip to Paris, except that it occupies a few days instead of a few hours; the Atlantic journey is accomplished with so much precision that you may predict within narrow limits the time you will dine in New York or Liverpool. Much of the steamboat traveling on the great rivers in America is delightful, but the comforts and luxuries of their railway service are greatly over-rated. There is simply no comparison between the smooth precision with which our trains run and the rollicking motion of an American express. Of course it varies, and sometimes for a few miles the train

runs smoothly enough, but at other times it rolls and rocks worse than a ship does at sea, except in a storm. With regard to all the accommodations for day and night travel, the Americans have such long distances to cover that they make the best of it, and that is all I can say in its praise. I once heard of a very plucky lady who, having a great horror of the sea herself, held strongly to the opinion that God never intended man to cross the ocean, and hence he sent him sea-sickness as a punishment for his temerity. If the old lady had said God never intended a Christian to live on a train—even the most luxurious specimen of an American train—day and night for a week, I should have felt heartily inclined to agree with her. I must not detain you with any detailed account of American scenery. New York Harbor, New York City, Boston, Philadelphia, Washington, the Hudson, Lake George, the mountains in the vicinity, Niagara, and a host of other places on the eastern border are worth crossing the Atlantic to see and visit, and if any of my pharmaceutical brethren are tired and jaded with work they cannot possibly do better than to take a trip to America. And now, what shall I say of American hospitality except that it is genuine, hearty, sincere, and as big as their great continent. I am convinced that it springs from a deeper source than community of interests in the same pursuit, and dates as they would say "way back" in the decades and the centuries whence we have sprung from the same source; and the history as well as the literature, the discoveries and the triumphs of our race are the joint heritage of America with ourselves.

Chicago well maintained the honor and reputation of America in this particular, and those of us who enjoyed the warmth and splendor of her private and public hospitality will ever treasure the reminiscence as one of the bright and happy experiences of our past. Personally, I have only one complaint, and that is that they were a little too exacting in their desire that I should "say something." To my colleagues, of one of whom it is written that "he always commanded attention whenever he took the floor," and the other, that "his tall, dark, and manly physique distinguished him whenever he rose in convention, and his remarks were always to the point," this was no hardship, but to one so unskilled in public speaking as I am, and who always remembers the thing he ought to have said after he sits down, it was embarrassing, and would have been more so except for the manifest courtesy and kindness of the listeners, who seemed to know what I ought to have said, and who were sure I would have said it if I could. I am not going to entertain you with newspaper and journal paragraphs about the English delegates, but there is one sentence of a personal character which I hope you will forgive me for transcribing. The writer says "Mr. N. H. Martin, of Newcastle-on-Tyne, did not speak as frequently as other visitors from across the seas, but he was valuable in committee work, and added his share to the success of the International Congress, and kept up the dignity, and reputation of our English cousins." I do not know the writer, but I thank him for the kindest thing he could have said about me, and I hope my colleagues on the Pharmaceutical Council, who know my preference for work in com-

mittee over speeches in Council, will be pleased that the same spirit animated me in Chicago. I may say, however, that several times it happened that our president had so well expressed my views and opinions as well as his own, on the subject under discussion, that I felt it was unnecessary to take up the time of the members with any remarks of mine, and I preferred to sit and listen to others.

With regard to the American Pharmaceutical Association, I was exceedingly disappointed to reach Chicago a day too late to hear the president deliver his inaugural address, for although I have read it in print it would have been a treat to have heard it first from the lips of its author. My friend Martindale removed the traces of the railway journey more quickly than I did, and hurried off to the meeting, so that when I arrived he was already seated among the elders in the odor of sanctity. When I came in, a paper was being read, but at the next interval I was invited to the front also, and received a most cordial welcome from President Remington, which appeared to be endorsed by the members present. The papers were then resumed, and I heard some of them read and discussed. Printed copies of the papers were handed around the room as soon as the authors commenced to read them, and as it was my first experience of this being the case I should like to tell you how it impressed me. It seemed to take all the interest out of the paper for the majority of the audience, who could go on with their private conversations during the reading, and yet by glancing over the printed paper could keep themselves abreast of the main idea in it. The effect was that the reader, instead of having an alert, attentive audience, appeared to be performing some sepulchral rite, but when he ceased the critics were very much on the alert in the discussion. The American Pharmaceutical Association is carried on in three sections, one is styled the section on Scientific Papers, another the section on Education and Legislation, and the third the section on Commercial Interests. The section on Scientific Papers was carried on until nearly 11 p. m., and as I was not aware that there would be such a late sitting I missed a considerable part of it. The papers were varied and practical in their character, and the discussions were participated in by a number of members with considerable spirit. There were several very interesting papers presented to the section on Education and Legislation, but one thing struck me very forcibly, and that was the volubility with which men read papers and discussed views and practices without the least intention or thought that they would have a practical bearing. It all seemed academical and inconsequential, and for such an intensely practical people as we usually think the Americans to be, it seemed to me a waste of time. Another striking feature was the frequent appointment of "committees of three." The President's address, instead of being made the subject of a vote of thanks immediately after its delivery, as it would be with us, was referred to one of these committees of three. The result was that no piece of business was debated and finished straight away, but there was an endless succession of appointments of committees and receiving of reports. The latter were frequently interpolated between the reading and discussion of some interesting paper, and

* Read before the Pharmaceutical Society of Great Britain at an Evening Meeting in London, December 13. Reprinted from Pharm. Journal.

formed an interruption which was anything but valuable in the elucidation of the particular subject which was at that moment before the meeting. The appointment of these committees was so informal that it sometimes happened that committees were appointed the members of which were entirely unconscious of it until months after. It was no one's special duty to apprise them of their appointment or to summon them to discuss the subject for the purpose for which they were nominated.

The section on Commercial Interests was vastly entertaining, but certainly not profitable. All that can be said is that they met, they discussed, they sometimes passed resolutions, and they adjourned until another year. A considerable degree of heat and temper was manifested during the discussions in this section, but immediately after the adjournment the resources of Chicago provided an efficient antidote, and it was not long, after the evening meeting, before good will and friendship again reigned supreme. An attempt is sometimes made to induce this society and the Pharmaceutical Conference of this country to take up what are called "trade matters" (the regulation of prices and so forth). If the men who are so anxious upon this score, and so sanguine that good could be accomplished thereby, could see how little it does in America, I think they would cease their demands.

The dominant feature of the American Pharmaceutical Association was the publication and presentation of the first copy of the United States Pharmacopoeia, which, although it is called the Seventh Decennial Revision and is dated 1890, was not published until August, 1893, and is not to be the official guide until January 1, 1894. You have all seen reviews and notices of this volume, and I have not yet had time to examine it with sufficient minuteness to add to what has been written, so far as the intrinsic merits of the details of the book are concerned, but I think every one who has had an opportunity of even the most cursory examination of it will agree with me that it is a volume of which the Americans may be justly proud. The historical introduction which gives us details of the genesis of this national pharmacopoeia, is full of interest, and from it we learn that up to 1840 the Pharmacopoeia committee had been composed entirely of delegates representing medical societies, although "valuable assistance was rendered to the committee by the colleges of pharmacy." Before the committee of 1840 separated, however, provision was made for a convention to meet in 1850, and in this resolution it was decided to invite incorporated colleges of pharmacy to send delegates to that general convention. From this time onward the influence of the pharmaceutical element increased in each succeeding decade, until on the Seventh Decennial Convention there were representatives from fifty-six pharmaceutical associations and colleges of pharmacy, and the committee was composed of about an equal number of members representing medicine and pharmacy. The result, I think, is most manifest for good on every page of the book. It is evidently a practical book, written by men who have used and tested the formulæ for the various preparations included. At page xvii, of the introductory remarks, the general principles to be followed in revising the Phar-

macopoeia are admirable, and I think they may well be taken as a guide in the production of our own standard work.

During the American Pharmaceutical Association week and the following we made frequent visits to the World's Columbian Exposition, a description of which I shall not attempt here. Our president, in his capacity of a British Commissioner, had many opportunities of becoming closely acquainted with that gigantic exhibition, and I hope he will, on some early day, give us a full account of it. The second week was devoted to the meeting of the International Congress, and in this arrangement I think our friends on the other side made a mistake. We were almost entirely the same set of men; we had but one week pretty fully occupied with matters pharmaceutical; we were largely attracted by the gigantic exhibition on the shores of Lake Michigan, and we were altogether not under the most favorable conditions for the serious discussion of the long list of subjects set down for the consideration of the Congress. There were some features, however, which were unique to this Congress, and I must not omit to mention them. The first, after settling the preliminaries of business, the election of officers, and so forth, was the presentation of the Hanbury medal to the late Professor Malsch. You all know the professor was too ill to be present, and that the formal presentation was made by our president, and the medal was received by Professor Remington, president of the Congress, on behalf of his dear friend and colleague, Malsch. Gentlemen, I have often been proud of Michael Cartelghe, but I never felt more pleased with any man than I was with him in presenting that medal. How his speech has read in hard type I do not know, but, delivered as he gave it, it was inimitable and magnetic in its effect. Professor Remington's reply on behalf of his friend was almost equally felicitous, and was touching in its pathetic allusions. Altogether I rejoice that I had the privilege of being present, and I shall never forget the presentation and reception of the Hanbury medal of 1893.

No meeting of the International Congress would be complete without a reference to an International Pharmacopoeia, but our American friends, with the laurels of their own successful book fresh upon them, took a practical and bold step, and carried matters further than had ever been done before, by voting a sum of one thousand dollars to be placed in the hands of a commission, which was to "be employed by this Congress to compile and publish an International Pharmacopoeia." The resolution of which this formed the basis was referred to a representative committee, of which I happened to be a member, and after a full and most careful discussion it resulted in a permanent committee of three being appointed, to arrange with the Pharmacopoeia committees of the various countries for the appointment of a commission to compile an International Pharmacopoeia of potent remedies. This committee, as you will have already seen, is composed of Professor Remington, Mr. Cartelghe, and Anton von Waldheim, and as there seems no more valid reason why such potent substances as tincture of aconite, tincture of opium and others should be of different strengths in the various civilized countries, except that there has been no official body to authorize their

uniformity, I hope that something like international agreement in these directions may now be accomplished.

The representatives from the continent of Europe who attended the Congress were few in number, but some continental pharmacists wrote and contributed some good papers on Education, Pharmacopoeial Nomenclature, etc., which were duly read and discussed, and the publication of which will be valuable.

On the third day of the Congress, an important discussion took place on the relation of pharmacists to public sanitation, and the subject of the adulteration of food, which was taken part in by several Americans, by Mr. Martindale and Dr. Hamlet. Subsequently a committee was appointed, and the following resolution was unanimously adopted: "That in the judgment of the Congress, the educated pharmacist is the natural and proper expert on measures for public tests, not only in the prevention of adulterations, but in the inspection of water supplies, of sewage, etc. The pharmacist is by virtue of his profession the common chemist of the common people." The last sentence reads well, and was received with applause, but before the "licentiate in pharmacy" of America, or the "registered chemist" of our own country will be able to establish any such claim "by virtue of his profession," he must make a much greater effort to become a chemist in reality as well as in name. With regard to the first half of this resolution, so far as it may have any reference to this country, however natural it may be for pharmacists to be the proper experts in the questions of sanitation and adulteration, the duties are already in the hands of persons who are for the most part not connected with pharmacy.

On the broad question of education for pharmacists, the Congress generally approved a four years' apprenticeship, and an enforced curriculum of study, and it was resolved that every delegate should use his influence to bring this about in his own country. An "enforced curriculum!" We have heard of it since education has been talked about; how long is it to remain in the region of talk?

I think I have now in a very cursory way given you an outline of our work and experiences in Chicago; in the further remarks which I intend to make I shall dwell upon some aspects of education, examination, and legislation as they affect pharmacy in the United States. In this I shall make no comparisons between ourselves and our American cousins, but confine myself to giving you an account of things as they exist on the other side. Great Britain has much to do to set her pharmaceutical house in order, and as there is slowly, but surely, approaching an occasion when necessity will be laid upon me, as president of the conference, to give another address, I hope to have a straight talk on British pharmacy and pharmacists. In the meantime there is no useful lesson to be learned from the United States. So far as my observation goes, I must record the impression I have formed that these three all-important parts of pharmacy, education, examination and legislation, are in an entirely chaotic condition in the United States, and that there are two factors, viz., the dollar and politics, which exert such a pernicious influence, and are so powerful, that I fear it will be many years before pharmacy will reach the plane to which.

many of our friends in America rightly aspire, and to which some of their literature which we meet with in this country would lead us to suppose they had attained.

With regard to education, if advertisements and prospectuses were reliable guides, every state and almost every city is provided with most ample facilities, but if we look beneath the surface and examine closely into the machinery for education, we shall find it differs in value—from the college of pharmacy with a seventy years' record of honored names and honest work, to the college (sic) of just as many months or days, with its self-appointed and denominated professors, who have little to commend them as fit for the posts they occupy, except the possession of an ineffable amount of self-assurance, and a fixed determination to be heard and known for their much speaking. There would appear to be no uniform standard of educational attainment even aimed at by many of these bodies, and although several of them have what they are pleased to call junior and senior courses, we find in some cases the latter are a mere repetition of the former, and that no attempt is made to take the student on to any higher plane of education. Most of the colleges, as the complement of an attendance upon their prescribed course and a more or less serious examination, confer upon their students the title of "graduate in pharmacy," but so little is this title respected in America, and so slight is the confidence reposed in its meaning anything, that at the meeting of the American Pharmaceutical Association in Chicago, the following report was unanimously adopted in the section on legislation:

"Regarding the question of registering of graduates of pharmacy without examination by boards of pharmacy, it is the sense of this section that the best interests of pharmacy are secured by the non-recognition of diplomas by the state boards. That there shall be no difference in the treatment of applicants for registration as pharmacists, whether they be graduates or not."

This means that the title of "graduate of pharmacy" is worth so little, forsooth, or is of such variable and uncertain worth, that even the boards of pharmacy (and I shall tell you presently how they are constituted and how they examine) are advised by a national assembly of pharmacists not to accept the diploma in lieu of their own examinations. I quote the following from a report of a state board of pharmacy:

"It is to be regretted that some colleges of pharmacy, in anxiety to increase their popularity or to enrich themselves financially, have become somewhat lax in their requirements for graduation," and then follow some further remarks, and a copy of a correspondence with a conference of the teaching colleges of pharmacy of the United States, in which are pointed out specific instances of laxity, such as crude and raw students with as little as fifteen months' practical experience of the drug business, and being under age, having been granted diplomas. The dean (sic) of one college claimed that "every American college is doing the same thing." The pharmaceutical journals admitted the existence of the evil, although some of them "hedged," but it was mentioned as a significant fact that those journals were the organs of the colleges

complained of. In this connection it will be interesting to record a question and answer in one of the papers presented to the American Pharmaceutical Association. "How can colleges of pharmacy be placed upon a purely educational basis instead of being conducted for the money they can make?" "By the drug trade of each section giving annually one-fourth the sum now expended for association entertainment and commercial interests, to the establishing of an endowment fund for the nearest college of pharmacy, the income to be devoted to practical instruction."

It will be impossible, within any reasonable space, to present to you a synopsis of the teaching in all the colleges of pharmacy in the States, but, broadly, the opinion I have formed is that there is not anything like sufficient time devoted to laboratory practice in any of the subjects taught. Lectures and review quizzes are provided in abundance, and these are frequently given in the evenings. I have before me the time-table of one college, in which there are lectures from 7:30 to 8:30 p. m., from 8:45 to 9:45 p. m., and a review "quiz" from 10 to 10:45 p. m. every night in the week except Saturdays, when there are two lectures and a review a little earlier. It almost takes one's breath away, and one naturally asks—When do the young men have time to think, and to assimilate and digest the substance of so many lectures and "quizzes," in such doses at bedtime? These lectures, and much of the work in many of the colleges, are arranged for the accommodation for men who are expected to be holding situations in some store or pharmacy, and who are spending the balance of their time (the best of their time, I should say) in the occupation of the proprietors of drug stores, where a miscellaneous business of all kinds is carried on, and whatever legitimate pharmaceutical work there is merely an adjunct to the soda fountain.

One college even advertises the fact that students attending it can obtain situations easily and earn enough for board and lodging. With regard to practical work, we find that one of the colleges—which boasts that "the facilities for laboratory instruction are unexcelled in this or any other country," and has a botanical laboratory, a microscopical laboratory, a chemical laboratory, a pharmaceutical laboratory, and a dispensing laboratory—condenses its practical work into two hours twice a week for twenty-five weeks, during which the students are supposed to be so proficient in these various studies that time is found for lectures on "anatomy, physiology, and the application of medicine to diseases, and the application of trusses to hernia." Amongst "elective subjects" we find lectures on the "origin and location of mankind, the origin of trade, botanical gardens, and medical practice," but in order to induce the student to "elect" to follow these he is assured that "the subject is very interesting, and takes up two lecture hours."

I now come to the question of the examinations by which pharmacy is State-controlled in America, and as the result of which the examined man becomes the possessor of a "certificate of qualification and competency," to either become an assistant, or the possessor of a store on his own account. In almost every state of the Union (if not in all) there is now in existence a Pharmacy Act, by which there

is created a "board of pharmacy," among the duties of which is the conduct of the state examinations. These boards of pharmacy usually consist of five men (in some cases there are only three), who are appointed by the Governor of the state for a term of years, and whose duties are only loosely defined, while their powers are as plenary and as absolute as the most despotic monarch could desire. In some states no other qualification is necessary than that the persons are, in the opinion of the Governor, competent to perform the duties; whereas, in other states, it is provided that three out of the five shall be graduates in pharmacy. These boards of pharmacy appoint one of their number as president, and another as secretary, after which they make up various committees. In one board of five members there exists a committee on "complaints and grievances," another on "adulterations and poisons," a third on "auditing and finance," and so on, so that it is no fancy picture that in America the ideal committee of "one" must be frequently reached. I have not desired to look for motives in the selection and appointment of the members of these state boards, but when I tell you that the secretary is appointed for a term of years, that in one state he gets a salary of \$2,000, and an allowance of \$600 or \$700 more per annum for expenses, I think there is room for the suspicion that political services rendered may be at least as powerful as pharmaceutical fitness, in the selection and appointment of one member of the board.

The board does not meet, as we would suppose, in the capital town or the most important center of the state, but is peripatetic, and travels (as occasion may require, I suppose) from one center to another; the consequence is there are no specially fitted rooms or laboratories suitable for the conduct of the practical subjects of dispensing and analysis, so we find these are dispensed with, and the examinations are entirely theoretical and almost entirely written ones. With regard to materia medica no further provision is made than that specimens of drugs, such as one member of the board can obtain by a visit to the chemists' shops in the neighborhood, just before the examination, appear to be handed to the students for identification and written description. The members of the board on reaching a town take up their quarters and hold their meeting at some hotel, whilst the examination may be held in a room in another hotel. On reaching the hotel where the examination is to be held the secretary calls the roll of students in attendance, and the president proceeds to make a speech, in which he informs the candidates, for the first time, so far as I can make out (there appear to be no printed rules or regulations to guide either the board or the students), of the subjects and scope of the examination, and warns them against the "clandestine use of books," "whispered consultations," and other unfair means of attaining the coveted registration of the board. In one case which I have recorded, thirty-one candidates answered to the roll call, and then two members of the board examined the candidates in "toxicology, prescriptions, and materia medica," from 2 to 5 p. m. A recess was then called, and at 7 the class reassembled and was examined in chemistry by another member of the board until 9:30 p. m. The

next morning at 9 a. m. the candidates reassembled, and were examined in pharmacy until 11:15 by a fourth member of the board. This completed the examination so far as the class was concerned, and a recess was taken by the board until 3 p. m., when the full board met again to "consider the answers to the questions," and as the result fifteen candidates were found to have passed a satisfactory examination before the board of pharmacy, and "on motion, were declared licentiate in pharmacy of the State of

"How long this process of examining the papers of thirty-one candidates in five subjects took is not on the minutes, but as a good deal of other work, including administrative and financial business was done, and no "recess" was called, I infer that the decision upon the papers must have been reached with considerable dispatch.

On another occasion, and in another town, the same board met when only three members were present, two of whom (so the minutes record) repaired to the hotel, where seventeen candidates were in waiting. The examination was conducted during the afternoon of one day and part of the morning of the next, and as the result four names were added to the list of "licentiates" of that particular state. You will observe the rejections—over 75 per cent.—are very heavy at this examination, and we may infer from it, probably, that the two members of the board, conscious of their responsibility to examine in five subjects, erred, if at all, on the side of the "safety of the public."

By this board toxicology is one of the subjects included in the examination, and I find among the questions a request for the symptoms of poisoning by aconite and nitrate of silver, subjects which we should relegate to the medical man. In another examination I find "physiology" included amongst the subjects, and such a question set as "Name the largest gland in the human body, and give an account of its functions." It is not necessary for me to add specimens of ridiculous answers to questions, a number of which were included in papers presented to the American Pharmaceutical Association, or to remark that some of the candidates are so ignorant and so little accustomed to handle drugs and medicines that a writer of a paper presented to the association mentions "the possibility of a candidate for registration in pharmacy being poisoned by the examination of samples submitted," but I would ask our American conferees, in all seriousness, if examination by a state-governor appointed board of pharmacy, in the manner and under the conditions I have sketched, can be accepted as anything better than a parody upon pharmaceutical education and knowledge. It is no answer to say that in this state on in that the governor has made the wisest possible selection, and has appointed five absolutely wise, learned, and conscientious pharmacists, who are capable men, able and willing to devote the time to the work; the system is entirely wrong, and no examination, in the true sense, can be conducted with uniformity and a becoming dignity by three or five men touring from one town to another, without a fixed suite of rooms properly equipped with apparatus and specimens for the work.

Lastly, I come to legislation, and on this point I have not much to say. One of

their own writers states "that the laws we have are crude, inconsistent, and therefore without value." I might leave this section of my notes there, but it will perhaps be more interesting to give you a slight sketch of what their laws are like, and I take a copy of the pharmacy law of one of the states, which was passed in 1880. The act consists of eleven sections. By the first it was enacted that "No person shall conduct or keep a shop of any kind for retailing drugs and medicines, or for dispensing physicians' prescriptions, except he be registered." So far this seems an ideal pharmacy act, and the handling for every purpose of drugs and medicines is confined to the educated and examined pharmacist, but unfortunately the second half of the section gives it nearly all away, as it is expressly stated that "It shall be lawful for any person to sell proprietary medicines, or to be the owner of a shop, if he takes no part in conducting, or keeping the same." This last condition is evidently overcome sometimes, as we find an advertisement for "a qualified man to take charge of a shop at a distance, or of one who has a diploma to let."

By the second section a commission of three, to be styled the "Commission of Pharmacy and Practical Chemistry," is to be appointed by the governor, and to hold office for three years.

Third.—The commission shall hold meetings for examination, etc., at least quarterly, "at such time and place as they may see fit."

Fourth.—They shall examine candidates, and if any one is found skilled and learned in pharmacy they shall give him a "certificate stating that he is a skilled pharmacist and authorized to engage in the business of apothecary and druggist."

You will have observed how under such delightfully vague law as this, men are examined in toxicology, physiology, and many other subjects which we do not connect with pharmacy. There is really nothing to prevent the board from requiring a knowledge of astrology and palmistry if this state-governor appointed board of three thinks these subjects essential to a candidate who is to be called "learned in pharmacy."

Fifth.—They shall examine applicants over 18, with two years' experience, and register them as assistants.

Sixth.—A registry to be kept.

Seventh.—A record of the doings of the commission is to be filed with the secretary of state.

Eighth.—"Applicants for pharmacists' (the fourth clause provides for their being registered as "apothecaries and druggists") certificates are to pay \$5, and of assistants \$2, and each commissioner is to receive \$5 a day for each day of actual service, not exceeding fifteen days in the year, and all expenses incurred in the discharge of his duties."

This is evidently a very economical state, and unless there is a good deal of elasticity about the last words of the clause, the state must be blessed with some patriotic men who will travel a long distance and examine men at \$2 and \$5 a head, on the pittance of \$5 a day and expenses.

Nine.—"All pharmacists lawfully registered are authorized to keep spirituous liquors for compounding their medicines."

In one form or another this is a very important clause. We find in one state one of the reasons for a candidate presenting himself as a candidate for examination is that he may as a registered pharmacist procure a "druggist's license to sell liquors," at the nominal fee of a dollar.

Ten.—"All persons violating this law shall be punished by a fine not exceeding \$50 for each week of the said violation."

Prosecutions appear to be among the duties of the commission, and quite a number of convictions are obtained and penalties received.

Eleven.—"This act shall not apply to physicians."

In most states men who possess medical degrees can claim to be registered as pharmacists without examination, and many practice as medical men at the same time they keep open shop.

Before I finish you may ask me—What was the actual condition of the drug trade, wholesale and retail in the states? With regard to the wholesale and manufacturing trade I will say but little, except to record the impression that there is a great disposition to use the power of money and the services and influence of science and scientific men, in fair and unfair attempts to induce medical men to prescribe and use only X. Y. & Co.'s tincture or extract. The result is that a dispensing chemist has to keep perhaps half a dozen different makers' preparations of a pharmacopoeial article. As to the retail trade, so large a proportion of their pharmacies have the appearance of bazaars and refreshment saloons that one is forced to the conclusion that these pharmaceutical adjuncts are really the important sources of the incomes of the proprietors, and we cannot but suppose that pharmacy suffers accordingly. It was with a feeling of intense pleasure that I visited on my last day in New York a retail pharmacy where there was no sign of soda fountain or sundries, and a pure prescription and drug business was done. I think it is due to the proprietor of this pharmacy, who has the courage to conduct a pure drug business, to state his name. It is Mr. Fraser, of Fifth avenue, and I should like to take this opportunity of thanking him, as well as many others whom I met in America, for much courtesy in giving me information.

In conclusion, although in what I have written I may appear to have blamed more than I have praised, I hope it will be received

"In spite of all, as brother judging brother."

There are men who have been, and are, connected with pharmacy in America whom I respect as highly as I do some of our own most distinguished pharmacists. Proctor, Parrish, Bedford, Mar-ko, Maisch, Squibb, Remington, and a number of others, have been familiar to me in their writings ever since my own connection with pharmacy, and I am indebted to them for much of the information which I possess and value. Bedford, Squibb, and Remington, I count it a happiness to have known, and to know personally. It is with the sincere desire that the pharmacists of the great American nation may be worthy of such men that I have written candidly upon what I have observed, which is hindering, and will hinder, the progress of pharmacy in that country.

[Written for the Era.]

A HASTY REVIEW OF THE NEW PHARMACOPŒIA,

By John Ritter, Chicago.

The new Pharmacopœia is now placed in the hands of the pharmacists of the country to be their guide for the next decade. Several important changes are noticeable in this revision. A few of the older preparations have been omitted and a few new ones have been added, making the total number of articles now official nearly the same in number as in the sixth revision. The abstracts, eleven in number, cease to be official, two fluid and two solid extracts have been omitted, but in their stead fourteen new fluid and solid extracts have been added. Of chemicals heretofore not recognized, but which are now made official, are the salts of strontium, the bromide, iodide and the lactate. Although they may give promise of great therapeutic value in the hands of some practitioners, it is very doubtful if more than one, probably the bromide, will survive the decennial.

There is still in the new, as there was in the old, Pharmacopœia, a tendency to drift into a lengthy foreign vocabulary for native drugs, (roots, herbs, etc.) which is hardly warranted. Many of the old English names for roots and herbs are given a subordinate place in the text and in future Pharmacopœias may be entirely omitted. Such names as burdock, blackberry root, blue flag, butter-bark are spoken of as Lappa, Rubus, Iris and Juglans, their proper English names appearing in small type in brackets. If this is to be the rule, it should be strictly adhered to. *Gossypil Radicis Cortex* is known by the English name of Cotton Root Bark. Why not *Gossypium*? By analogy; burdock root being given as Lappa, Cotton Root Bark becomes *Gossypium*. If the English name of "Rheum" is *Rhubarb*, why should not "Anthemis" be called "Chamomile," and again in *Extractum Rhei Fluidum*, if *Rhubarb* in No. 30 powder, etc., why not *Cascara* in No. 60 powder in *Extractum Rhamni Purshiana* instead of *Rhamnus Purshiana*, in No. 60 powder, etc.

A few typographical and other almost unavoidable errors have crept into this, the first edition of the new revision, which must not be overlooked, and the proper corrections made in the next edition. Corrections should be made as follows:

Page 3, bottom line. Preparations: "Pulvis Cretae Aromaticus" should read "Pulvis Cretae Compositus."

Page 100. *Coriandrum*. Last line on page. Preparation: "Confectio Sennae" should be canceled. In the formula given or preparing "Confectio Sennae," 5 minims of oil of coriander are directed to be used, not coriander.

Page 196. *Foeniculum*. Preparation: "Pulvis Glycyrrhizae Compositus" should be erased. Let it read "Infusum Sennae Compositum."

Page 299. Cancel last line "Extractum Phytolacae Fluidum." There is no such official preparation as Fluid Extract of Poke Berries. The only official preparation of Poke is the *Extractum Phytolacae Radicis Fluidum*, the Fluid Extract of Poke Root, the extract of the root, not of the berries.

Page 324. *Potassii Nitras*. Thirteenth line from top of page. Preparation: "Potassii Nitras" should read "Argentii Nitras Dilutus" (vide Errata and Addenda at end of volume).

Page 340. *Rosa Centifolia*, Pale Rose. Fifth line from bottom of page. Preparations: "Syrupus Sarsaparillae Compositus" should be canceled. Observe that *Rosa Centifolia* is neither an ingredient of *Syrupus Sarsaparillae Compositus*, nor of *Decoctum Sarsaparillae Compositum*, nor of *Extractum Sarsaparillae Fluidum Compositum*.

Page 453. *Zea*, Corn-silk. Observe preparation, "Extractum Zeae Fluidum." This the eighth line from top of page, should be expunged. No preparation of corn-silk is official in the new standard.

Preparations should be mentioned in connection with the following official articles:

Page 21. *Acidum Stearicum*. Preparation: "Suppositoria Glycerini."

Page 54. Is not confection of rose as distinct a preparation of *Aqua Rosae Fortior* as is *Tinctura Benzoini Composita* of *Aloe Purificata*?

Page 106. *Elastica*. Preparation: "Charata Sinapis."

Page 333. *Resina Scammonii*. No preparation of Resin of Scammony is given, although it is an ingredient of *Pilula Catharticae Vegetabiles* mentioned as a distinct preparation of Resin of *Podophyllum*. Let the last line on the page read, Preparation: "Extractum Colocynthidis Compositum."

Page 354. *Sodii Bicarbonas*. Preparation: "Pulvis Effervescentis Compositus."

Strictly pharmaceutical preparations, for which working formulae are given in the text, have all their quantities (by weight or by volume) expressed in words and by figure, two exceptions being *Acidum Hydrochloricum Dilutum*, page 14, eleventh line from below, where the quantity of water is given "Water 65 cc.," omitting the "sixty-five cubic centimeters," and in *Acidum Sulphuricum*, page 23, seventeenth line from below, "Distilled water, 1,000 cc.," omitting "one thousand cubic centimeters."

The new Pharmacopœia recognizes as official eighty-eight fluid extracts and thirty-three solid extracts, a total of one hundred and twenty-one extracts. Of the solid extracts not in the Pharmacopœia of 1880, but official in the present revision is one, the *Extractum Jalapae*, page 147. The English name, *Extract of Jalap*, does not appear. It should follow immediately under the words "Extractum Jalapae." Of the fluid extracts, one which is now official and which was not in the Pharmacopœia of 1880, is to be mentioned, the *Fluid Extract of Broom*, page 167. The Pharmacopœia directs that the Broom be exhausted with diluted alcohol and then continues, "Using the same proportions of alcohol and water as before." Cancel, "Using the same proportions, etc." The direction to use diluted alcohol is quite sufficient.

The Pharmacopœia now recognizes thirty-two official syrups. One at least seems to be very anomalous. Page 339, *Syrupus Amygdalae*. Sweet almond, 140 gm., etc., water, 200 cc., syrup a sufficient quantity to make 1,000 cc. The directions given on next page for preparing Syrup of Almond, seem to be greatly mixed. The use of syrup for making 1,000 cc. is entirely ignored; instead of 200 cc. of water which the formula directed, 330 cc. are used, and in addition a sufficient quantity to make 1,000 cc.

The last page in the Pharmacopœia gives a list of "Corrections and Addi-

tions." It mentions page 189 and directs that the following corrections be made there: Line 14 from below should read the "Iron Wire, Iodine," instead of "the Iron, Iodine." The same correction should be made on page 392, nineteenth line from below. This list also directs that corrections be made on pages 440 and 444. The fifth line from below on either page should read: "Five grammes, 5 gm.," instead of "five cubic centimeters, 5 cc.," Corrections should also be made on page 441, twenty-second line from below so as to read: "Ten grammes, 10 gm.," instead of "ten cubic centimeters," and again on page 444, the thirteenth line from below to read "ten grammes, 10 gm., instead of "ten cubic centimeters, 10cc." 10 cc. of water, hot, as directed, are not 10 grammes. The correction to be made on page 303, top line, *Pilulae Antimonii Compositus*, is fully set forth in this list of corrections. It should read: "Castor oil, a few drops at a time" instead of "mucilage of tragacanth, etc."

The Solution of the Subacetate of Lead, the official *Liquor Plumbi Subacetatis*, page 237, and the preparation known as *Goulard's Extract* are one and the same, in fact, the terms are synonymous, just as the *Ceratum Plumbi Subacetatis*, page 84, and *Goulard's Cerate* are identical. The term *Goulard's Extract*, is not to be found in the text of the Pharmacopœia, although reference is made under *Ceratum Plumbi Subacetatis* to its being *Goulard's Cerate*.

The formula for preparing *Spiritus Aurantii Compositus* is given on page 372. The seventeenth line from below reads "Oil of Orange peel 200 cc." The volatile oil of both, the bitter and the sweet orange peel, is official. Which should be used?

Page 415. *Tincturae Herbarum Recentium* is the single exception that does not follow strictly in alphabetical order. Following *Digitalis* in regular order, it would come after *Tinctura Gualaci Ammoniatæ*. (The arrangement followed by the committee was to consider the entire title, thus "turae Herb" precedes "tura Ferri," and our correspondent's objection does not hold. Ed.)

Castanea, chestnut, is found on page 81. *Castanea*. Nat. order *Cupuliferae*. In the word *Cupuliferae* the letter "p" is omitted, an inverted "a" being inserted instead.

Page 25. The third line from the top of the page, for "Oxalic and Uvic acids" read "Oxalic and Uric acids."

Page 60, sixth line and part of the seventh from below reads: "Difference from and absence of more than a small proportion of hyoscyamine." Let it read: "Difference from hyoscyamine and absence of more than a small proportion of it." It is better English. Similar passages occur quite frequently throughout the work. (The committee's grammar is better than the writer's in these instances. Ed.)

Page 307. *Piperinum*. Molecular weight 254.34 should be 284.3.

A hasty glance at the formula given for preparing *Sulphurated Antimony* shows that the product obtained is not true *Kermes Mineral*. Page 44. (a) *Antimonium Sulphuratum Amorphosum*, *Antimony Trisulphide* with microscopic crystals of *Antimony Oxide* about six per cent, *Kermes Mineral*, reddish-brown.

(b) *Antimonium Persulphuratum*, *Penta Sulphide of Antimony Sulphur Aurant*

Antimonil, Golden Sulphide of Antimony, orange red. As stated, the product obtained by the method in the Pharmacopœia is not true Kermes Mineral, but Kermes Mineral with a variable quantity of Pentasulphide of Antimony, which is precipitated by the sulphuric acid. It is a mixture of Kermes Mineral and Golden is very prone by oxidation to be converted Sulphide of Antimony. Kermes Mineral, at least in part, into pentasulphide and oxide of antimony, hence while preparing sulphurated antimony it must be thoroughly and quickly washed and dried and at a temperature not exceeding 30° C., and preserved in a dark place protected from light. Even with all due precautions it retains sufficient moisture for slow oxidation to take place.

After the subsidence of the Kermes Mineral in the process given for obtaining it, the addition of sulphuric acid to the supernatant liquid precipitates the golden sulphide of antimony. The former was formerly known by the name of the "Oxy-sulphure of Antimony," Antimonium Oxy-sulphuratum, which it really is and which is the preparation known as Kermes Mineral, hence cancel. Preparation: "Phillæe Antimonil Compositæ." (The committee's chemist may not coincide in these views. Ed.)

The committee on revision has adopted a rule to exclude all patented, proprietary or copyrighted preparations from the Pharmacopœia. On page 343 Salol is given. Purchasing a bottle, almost the first thing that will attract attention, after removing the wrapper and scanning the label, is that the word Salol is protected by copyright United States Patent Nos. 350,012, 377,311 and 383,306. A derivative of Phenol. If it is to be official, why not call it by its proper chemical name, Phenyl Salicylate, making no allusion to Salol? A great number of new preparations, most of which are protected by copyright, derived from coal tar, and which have been introduced to the medical profession within the last few years as antipyretics, could equally demand recognition and with as much propriety as Salol.

Another preparation which has been introduced into pharmacy since the revision of 1880, and which is now making its debut in the present Pharmacopœia, is the purified kresae obtained from lamb's wool, the Oleum, or Adeps, Lanae, the hydrated form of which is known by the official name of Adeps Lanae Hydrosus, page 27. The purified fat of the wool of sheep mixed with not more than thirty per cent of water. Wool fat or cholestrine, when pure, is not miscible with water. It is only when an alkali or some bland solution, such as muclilage, is added, that water may be incorporated. Take 100 grammes of sheep's wool from a fleece rich in kresae, put it into a percolator provided with a close-fitting cover and extract the wool with ether. The percolate yields, after the ether has all been expelled, a yellowish-brown fat, which is incapable of miscibility with water, but will readily produce an ointment-like mass on the addition of an alkali or a little muclilage. The fat so obtained is not strictly pure wool fat, though sufficiently so for all practical purposes. It may here be remarked that this fat is non-saponifiable, and the ointment-like mass obtained is really only an emulsion. By the process for washing raw wool large quantities of this grease or fat are

obtained as a by-product, which, under the name of Degras, has a large commercial value. Large quantities of this crude wool fat are annually imported into this country. This fat is used in various industries and, as found on the market, is more or less adulterated with other fats and oils, with rosin and water, according to the use that is to be made of it. In the tanning of certain kinds of leather, as a soap stock in the manufacture of cheaper grades of soap, in the manufacture of India rubber goods, it finds ready use.

A working formula for the preparation of purified anhydrous wool fat from either the commercial or crude product, or preferably direct from sheep's wool, by means of benzine from which all sulphur compounds have been completely removed and which may be volatilized without leaving the least trace of foreign odor, would be most desirable. After all is not the Pharmacopœial name only the synonym for a copyrighted preparation? One would be neither disappointed nor chagrined, in ordering purified wool fat, to be supplied with this patented product.

Is it not an oversight that that well-known and very efficient preparation Mel Sodii Boratis, or more properly the Mel Rosae et Sodii Boratis, the popular Rose Honey and Borax, has not been assigned a place in the Pharmacopœia? There are preparations of less merit and worth which receive recognition from one revision to another. Rose Honey and Borax is found in every pharmacy throughout the land, in some localities, especially in the large cities. It is frequently called for, and as often prescribed by practitioners as is Tincture of Arnica. Probably it is too domestic a remedy. In infantile diseases, in the treatment of simple cases of aphthae, stomatitis, etc., it is the remedy most relied on by the physician.

On page 216 is found Star Anise, the botanical name of which is given as *Illicium Verum*. The botanical name of the poisonous fruit, with which Star Anise is liable to be confounded, is given as *Illicium Anisatum*. Linne, *Illicium religiosum*, Siebold. The Pharmacopœia of 1880 gives the name *Illicium Anisatum* as being the botanical name of the true Star Anise, and *Illicium religiosum* as that of the poisonous variety. The present Pharmacopœia gives both *Illicium anisatum* and *Illicium religiosum* as of the poisonous variety. The specific name "Anisatum" is misleading. One would naturally infer that it is that of Star Anise.

Tobacco, page 402. Tabacum is still retained, no preparation of tobacco being official. A working formula for a Compound Tobacco Ointment would be most desirable. Many practitioners are wont to use a relaxing ointment in these insidious and alarming maladies, such as croup, croupy cough, pseudo-membranous croup, etc., and for want of a desirable official ointment, usually have recourse to a patented salve. An ointment which could be placed in the hands of the medical practitioner, equal if not superior to this patented ointment, would find great favor.

Quite a number of articles have been dismissed from the Pharmacopœia. Some have been retained which are obsolete and a few which are of no special medicinal value. Of those that possess no real medicinal properties, two may be mentioned, viz., fig and prune. The pulps of the fig and prune are used as ingredients in Confection of Senna, Confectio Sennae,

page 99. Let us see how valuable and how efficient these pulps are, or if the medicinal properties of the powdered senna leaves in this reliable preparation are augmented by them. The fig and the prune belong to a class of evacuates, which in medical parlance are known as mechanical cathartics. Their pulps, as ingredients in Confection of Senna, are not cathartics per se, the cathartic effect produced is due to the numerous little seeds or fruit which are distributed throughout the fig, in the prune to the indigestible skin. When either fig or prune is ingested, these indigestible particles pass out, through the alimentary canal, unchanged, but not without some action. They exert a stimulating influence on the muscular fibres of the intestines through the mucous membrane, accelerating the peristaltic action. The ingestion of unpeeled fruit, such as apples, peaches, pears, or of grapes, plums, currants, will produce more or less catharsis, the presence of much or little tannic acid will modify their action. The use of yellow mustard seed (not ground) in tablespoonful doses as a domestic remedy in dyspepsia, indigestion, habitual constipation, is well known. Now in Confection of Senna, prepared according to the directions given, these indigestible particles of the fig and prune, and which operate as mechanical cathartics, have been entirely or almost entirely removed, leaving only the pulpy mass of the fruit, hence it is very evident that the use of either fig or prune in Confection of Senna may be omitted without impairing or lessening its cathartic properties.

Among the obsolete not dismissed from the Pharmacopœia is Auri et Sodii Chloridum. It is of no special therapeutic value in the treatment of disease. Can it be that, in retaining it, the committee had in mind the "Bichloride of Gold cure?"

Muclilage Sassafras Medullae. It is seldom used and only as a collyrium, in which instance any other muclilaginous preparation will answer equally well.

ADULTERATION OF BEESWAX. L. F. Kebler, in a carefully prepared paper recently read before the Philadelphia College of Pharmacy (printed in Am. Jour. Pharm.), sums up his conclusions from analyses of various samples of beeswax and other waxes and allied products, by saying that beeswax, in our markets, is adulterated to the extent of 50 per cent, while in English markets it rises to 66.2 per cent. The melting point of beeswax, which varies from 62° to 64° C., is raised by carnauba wax, stearic acid, certain mineral waxes, and paraffines, while it is lowered by China wax, Japan wax, cacao butter, resin, tallow, spermaceti, vegetable waxes, and certain stearic acids and paraffines. It is apparently unaltered when adulterated with suint wax and certain mineral waxes, paraffines and stearic acids. (It is evident that quite an important point for the analyst to decide is just what "certain mineral waxes, paraffines and stearic acids" are employed by the sophisticated.—Ed.) The normal specific gravity (0.969 to 0.973) is greatly increased by resin, carnauba wax and certain mineral waxes, and lowered by paraffine. The writer considers the "acid number," "ether number," "iodine absorption figure" and other tests of service in valuation of the samples.

[Compiled for the Era.]

TABLE OF SPECIFIC GRAVITIES OCCURRING IN THE U. S. P., 1890.

By F. J. Wullgang.

Temperature, 15° C., 59° F., unless otherwise specified.

ADULTERATION OF OLIVE OIL.

V. Olivier has examined 106 samples of genuine olive oil, finding the amount of potash required for saponification to vary from 19.05 per cent to 19.50 per cent and the iodine absorption from 79 per cent to 83.2 per cent. He tested a number of different oils by oleo-refractometer and is of the opinion that this instrument will be of use to detect considerable adulterations of olive oil. Oils giving normal figures cannot always be passed as genuine without further examination. He relies on the iodine absorption to detect adulterations. Commenting upon these conclusions, one of the staff of the Analyst believes that the maximum iodine absorption given is low, as numerous cases of oils having iodine absorption of 87 per cent to 88 per cent have been reported.

*Specific gravity increasing with age.

PHARMACY.

FOR BURNS a paste of bismuth subnitrate in water, applied with a soft brush, is a late recommendation.

AQUEOUS EXTRACT OF JALAP. Considerable doubt is expressed relative to the efficacy of such a preparation as this, which has recently been proposed by an eclectic physician.

NO MICROBES IN BREAD. Scientists have for a number of years been searching for microbes, especially toxic ones, in all things under the heavens. It is consoling to learn that bread, the staff of life, is not the harbinger of life destroyers.

POTASSIUM CHLORATE AND ALCOHOL. These articles should be mixed with care, says Schneider (Pharm. Cent.) if the chlorate be triturated with alcohol in a mortar, a number of detonations take place and, under certain circumstances, the explosion may become a violent one, this latter in case the chlorate mixed with alcohol be subjected to a sudden blow.

LEAD POISONING FROM EARTHEN JARS. A number of cases of lead poisoning have appeared in Great Britain, which have been traced to wines and beer made in glazed earthen vessels. G. A. E. Roberts points out, in Br. Med. Jour., that the use of lead in glazed dishes should be prohibited, or they should be marked in some way to show that it was unsafe to brew in them.

AN INGENUOUS VOCATION. Someone in London is offering best medical advice by supplying copies of the "prescriptions of famous West-End doctors," which he has dispensed for years. Similar methods have been followed by unworthy members of the pharmaceutical fraternity in the United States, but they have not openly advertised the fact. Prescribing druggists are a thorn in the flesh in England, it seems.

IRON MAY BE REMOVED FROM RUST OR STEEL, if it be fresh and superficial, by rubbing the article with velvet cork merely dipped in oil, but, if the rust be deep-seated a paste of tripoli, flowers of sulphur and olive oil should be spread on the part, allowed to remain a time, and then rubbed off with a camolis or soft buckskin. In obstinate cases, rubbing with emery is a last resort.

AN ELECTRIC FURNACE employed by Moissan in his experiments with very high temperatures is described as being made of whole slabs of magnesia, placed one on the other and prepared under special conditions. A tube made of charcoal fitted beneath the crown forms a separate enclosure in which the reactions take place free from foreign vapors and in an atmosphere of various gases. Moissan has obtained several pounds of chromium by the aid of this furnace.—(Chem. and Drug.

SESAME OIL IN OLIVE OIL.—In a test tube containing 14 to 28 gms. of the suspected oil is poured 14 gms. of a solution of 2 parts pyrogallol in 20 parts of hydrochloric acid, the tube is shaken vigorously and set aside to allow separation of the liquids. The oily layer is then removed and the acid solution is boiled for 5 minutes. The acid solution acquires a purple tint if sesame oil be present, but, if the oil be pure, the tint is only straw color. The test is sufficiently delicate to detect 1 per cent sesame oil.

RECTIFICATION OF ALCOHOL. The first distillate of alcoholic liquors is often very impure, and there are numerous methods for its rectification. The sodium chloride of recent introduction has been proposed as an efficient agent for the process. It has added in quantities of 100 to 500 gms. per hectolitre 24 hours before rectification. It is said that a product is thus produced of first rate taste and odor. The sodium chloride acts both as an oxidizer and an alkali, both which properties are employed in other methods.

AUTULTERATED LICORICE AND GINGER. Food and Sanitation makes the statement that there are very few genuine licorices on the market, while there are many that contain large percentages of spurious admixtures. It states that in a number of samples recently purchased analysis discloses in some of them as high as 70 per cent adulteration. It advises purchasers to buy neither licorice nor ginger without a guarantee of genuineness, and alludes to the fact that some firms quote ground ginger at a less price than whole ginger, evidence on its face of a fraudulent article.

TRUE MARINE GLUE is a combination of shellac and caoutchouc in proportions which vary according to the purpose for which the cement is to be used. Some is very hard, and some quite soft. The degree of softness is regulated by the proportion of benzole used for dissolving the caoutchouc. Marine glue is more easily purchased than made, but when a small quantity is needed the following recipe will give very good result: Dissolve 1 part of India rubber in 12 parts of benzole, and to the solution add 20 parts of powdered shellac, heating the mixture cautiously over the fire. Apply with a brush.

PERMANENT SYRUP OF IRON IODIDE. Augustus Bradley (N. C. P. A.) suggests the following working process: Place 266 grains of iron card teeth and 5 ounces of distilled water in a flask and add 2 avoirdupois ounces iodine. After cessation of chemical action, pour the solution of iron iodide on a filter, taking care that the orifice of the funnel is beneath the surface of a mixture of 101-2 av. oz. sugar and 31-2 av. oz. glucose contained in a porcelain vessel. Heat until the boiling point is reached. When cold add 3 fluid drams of 10 per cent hypophosphorous acid, and sufficient distilled water to make 1 pint. Store the product in 2-ounce bottles accessible to light.

DETECTING HEATED COTTON OIL IN LARD. Place about ten grams of the sample to be examined in a porcelain capsule of about half an ounce capacity. A small disk of white filter paper (which has been soaked in hydrochloric acid, thoroughly washed with distilled water, and dried) is just moistened with a 12 per cent solution of nitrate of silver, and placed in the concave part of a watch-glass, which, with the paper downward, is then inverted over the capsule containing the sample. The capsule is then put in a shallow oil bath, to which heat is gently applied, until 240° F. is reached. The source of heat is then immediately withdrawn. If even less than 1 per cent of heated cotton oil be present in the sample, a very marked coloration takes place on the disk, varying from a light brown to nearly black. If the sample under examination be pure and fresh, the disk is apparently unaffected.

CREOSOTE PILLS. Dieterich comments upon the fact that, while there is little difficulty in making creosote pills with the ordinary excipients, he believes that such pills are not best for administration, because they fall of disintegration in the body. He advises an emulsification of the creosote by thoroughly rubbing up 10 parts of it with 1 part calcined magnesia and 2 parts glycerine and to this mass is then added in the order given, 5 parts each of calcined magnesia and licorice extract, and about 16 parts licorice root and formed into a mass, which is then to be cut into 100 pills and dispensed as desired. These pills easily disintegrate and, upon squeezing, the creosote does not ooze out from them.

TAR PILLS. Make in the same manner as directed for creosote pills, substituting oil of tar in equal quantity for the creosote.

PLANTS WITH POISONOUS ODORS. There are few flowers whose perfume is actually deadly. It is said, however, (W. D.), that the flower of the Kalamujah, or death plant, found in the islands of Java and Sumatra, emits a perfume so powerful as to overcome, if inhaled for any length of time, a full-grown man, and killing all forms of insect life approaching it. This perfume resembles chloroform in its effect, producing insensibility. All insects and birds seem instinctively to avoid the plant. Linnæus mentions a case in which the odor of the rose bay proved fatal, and there is a plant known to the Persians as kerzeroh, the perfume of which they believe will kill a man if he inhales it after a hot south wind has passed over its blossoms. Many other plants, though not having deadly perfumes, nevertheless give forth odors which are decidedly hurtful. The *Poæria foetida* excites fever and headaches in those inhaling it. One of the magnolias emits an odor which produces in many persons nausea and sickness, and the poison sumach and poison dogwood are apt to lead to similarly unpleasant effects.

DETERMINATION OF ESSENTIAL OILS IN ALCOHOL. An elaborate paper by Bardy and Berard is offered in a recent issue of *Jour. de Pharm.*, from which *Pharm. Jour.* takes this description of a method of determining qualitatively the presence of essential oils in solution in alcohol. 25 cc. of distilled water are added to 1 cc. of alcohol, to which is then added 1 cc. of permanganate solution (1 gm. to the litre). If the color does not appreciably alter only traces of oil are present, but, if there is a decided change to maroon or yellow, then to 5 cc. of the spirit add 30 to 35 cc. of brine colored with a little aniline violet. An oily layer of a violet tint may now rise to the surface, and in that case, by operating upon a larger quantity of the alcohol in a similar manner, an appreciable quantity of oil will be separated and its amount may then be determined. The essential oil remaining in solution in the alcohol may be determined quantitatively by a further process, which must also be employed in specimens from which no oily layer separates. This method consists essentially in the separation of the oils by means of carbon bisulphide and their conversion by the action of sulphuric acid and sodium acetate into the acetates of higher alcohols, the amounts of which are then determined, and will indicate the percentage of essential oil dissolved in the alcohol

NEW REMEDIES.

ATHEURIN is a hair dye of Austrian recipe, which *West. Drug.* states is ammoniated pyrogallol solution in alcohol.

AQUOZONE is sold by the *New York Medical Journal* to be a 2½ per cent aqueous solution of ozone rendered permanent by the addition of hypophosphites.

MIGRANIN is a new remedy exploited by Meister, Lucius & Bruenig. Its exact constitution is not divulged, but it is presumed to be a double citrate of antipyrine and caffeine.

RESORBIN is an ointment base prepared by a patented process from a vegetable foundation, such as almond oil mixed with water and an emulsifying agent (*Chem. and Drug.*). Its advantages are said to be ready miscibility with aqueous solutions.

CAIRMALUM is a new staining agent for microscopical use, produced by heating together nearly to the boiling point, 20 cc. distilled water, 10 grams ammonium alum and one grain carmine acid, and decanting or filtering the liquid. A small crystal of thymol is added as a preservative.

DIODOFORM is an antiseptic offered by Adrien, of Paris. He produces it through the action of iodine upon acetylene periodide, and it appears in colorless, needle-shaped crystals. *Chem. and Drug.* describes it as free from odor and as having proved of good service in surgical practice.

LORETIN is a newly proposed substitute for iodoform. It has the properties of an acidulous substance, combining with metallic bases. In chemical constitution it is meta-iodo-ortho-quinoline sulphionate. In appearance it is very similar to iodoform, but is odorless. It is said to act well as a dusting powder employed mixed with magnesia.

CHLOROL is a new disinfectant, which *Jour. de Pharm.* states has the composition of one part each of mercuric chloride, sodium chloride and hydrochloric acid, three parts copper sulphate and 1,000 parts water. It is, therefore, merely a corrosive sublimate preparation, the reason for the presence of copper sulphate being that this salt may act as an emetic in case the solution be accidentally swallowed.

BISMUTH PHENOL is a preparation patented in Germany, the process of whose production is thus described by *Chem. and Drug.* A solution of 38 parts phenol in 400 of water is mixed with 16 parts of sodium hydrate and 49 parts of bismuth nitrate. The precipitate is boiled with water, washed, dried, and then is found as a grayish white powder showing about 80 per cent of bismuth oxide.

BORON-EISEN is described in *Chem. News* by H. N. Warren, who produces it by mixing solutions of borax and ferrous chloride, pressing the resulting white precipitate to free it from adhering water, and, after thoroughly drying, reducing it with an equivalent proportion of carbon in a lead crucible. In this way four to five per cent of boron is said to enter into union with the iron, a compound being produced with the fracture of metallic manganese, and possessing sufficient hardness to scratch glass. It is difficultly soluble in acids, and its melting point is nearly that of cast iron. It may be prepared also through the reduction of ferric carbonate or oxide mixed with boron oxide and charcoal.

RHODINOL is an oily liquid, specific gravity 0.8956, boiling point 125.5° C, which occurs as a constituent of the liquid portion of rose oil. In chemical constitution it is a primary alcohol, whose formula consists of 10 atoms of carbon and 13 of hydrogen. Hydrochloric acid converts it into dipentene dihydrochloride. Its various chemical reactions and decompositions have been studied by Barbier, who contributes his results in a paper given in *Compt. rend.*

ASPOLIN. Lambliack would not, at first sight, seem to be the source of any very potent medicinal agent, but Braconot derives from it this new preparation which he recommends for tuberculosis. It is a dark yellow, syrupy liquid, produced by boiling lambliack with water, adding hydrochloric acid and extracting with alcohol. Upon evaporation of the tincture and treating the residue with ether and distilling off the latter, the aspolin remains. In composition it is principally pyrocatechin and homopyrocatechin.

DISINFECTANT ACTION OF SAPROL. Saprol is an oily brown liquid with an odor of carbolic acid. Specific gravity 0.990. Contains 43 per cent of phenol, 53.9 of cresol, 2.3 of hydrocarbons, pyridin and other bases. Saprol constitutes an admirable disinfectant, devoid of the inconveniences presented by other disinfectants. Distributed in a uniform manner on all fecal matter it covers it with an impermeable film; the phenol and cresol which it contains penetrate little by little in the subjacent liquids. When the liquid possesses an alkaline reaction all the constituent parts exercise their disinfectant action. In the absence of an epidemic 1 per cent of saprol will suffice to disinfect all fecal matter.

THE MATTEI CANCER CURE has come near to involving Great Britain in a most serious imbroglio. It has placed the journals and the daily papers at loggerheads and has brought the great editor, Stead, of the *Review of Reviews*, into disrepute with certain sanitarians. In *Food and Sanitation*, an analysis of these wonderful cures is given to the world and we are told that the cures, so wonderful according to the cancer specialist, contain nothing but water, sugar, starch, sulphate of lime and a little albuminous matter. Analyses of 5 phials of Mattei's Electrics result in the statement that their composition is identical with that of pure water. The journal in which we find this information is making it very lively for Editor Stead and accuses him of all the sins of the decalogue, and particularly frowns upon Stead's plan by which the public is to contribute £100,000 to establish a new journal. All in all, the information given by *Food and Sanitation* is of a rather startling nature. It thinks Editor Stead is mixed up with a new drunk cure company. In this connection it is significant that the *Patent Medicines Journal* is coming out in fulsome articles relating to Mr. Stead and his proposed new venture, the *Daily Paper*. A good many people are calmly sitting on the fence, endeavoring to arrive at a determination to support one side or the other.

OINTMENT ZINC OXIDE. Augustus Bradley suggested at the recent meeting of the North Carolina Pharmaceutical Association, a modification of this preparation, which he finds free from granulation and rancidity: Eight ounces of white petrolatum are thoroughly rubbed up with 2 ounces of zinc oxide.

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

QUERIES ANSWERED.

5896. Female Complaints.

(J. A. C.) We cannot answer queries of this character and would advise you to consult a reputable physician.

5897. Tasteless Cod Liver Oil.

(A. R.) See reply to query No. 5063, July 1, 1893, *Era*, page 15. Also supplemental information, query No. 5297, August 15, 1893, *Era*, page 153.

5898. Treatment for Pimples.

(J. H. B.) Various methods of treatment have been published in the *Era* from time to time. See *Era* of January 15th, 1892, page 246; March 15, 1892, page 171; April 1, 1892, page 204; April 15, 1892, page 234.

5899. Imperial Blue.

(K. Bros.) is the name of a shade of blue, of a reddish hue, and is applied to the color obtained from certain of the various manufacturers. It can be procured through almost any jobbing dealer in aniline dyes.

5900. Chloral and Potassium Bromide.

(G. C. J.) See reply to a similar query in the December 15, 1892, *Era*, page 366. Why do you not try the formula for compound mixture of chloral and potassium bromide of the National Formulary?

5901. Specific Medicines.

(J. O. F.) asks for information regarding "specific medicines," as "specific aconite," specific belladonna, etc. These remedies are listed by certain manufacturing houses and no doubt correspond with the so-called "specific tinctures," information concerning which may be found in a reply in this issue to the query of another correspondent.

5902. Tincture White Pine.

(R. R.) The following is taken from the *Era Formulary*: White pine turpentine (gum), 2 ounces; alcohol, 14 fluid ounces. Cut the turpentine into small pieces and dissolve in the alcohol by gentle heat of the water bath. This is used in making syrup of white pine and syrup white pine compound. See *Era*, April 15, 1893, page 350.

Reproduction of German Prescriptions.

(A. J. G.) The prescriptions you send are not originals but copies, and the reproduction of them, were we so inclined, would be an utter impossibility. They would be of interest, no doubt, to many American pharmacists as showing how and what a German physician may prescribe, but in other respects they do not differ very greatly from many other prescriptions received from German physicians by druggists who cater to a German trade.

5903. Specific Tinctures.

(A. J. G.) Generally represent one-half grain of the drug in each minim of

the tincture and compare very closely in strength and other particulars to those made by the pharmacopoeial process for tinctures from fresh herbs. The so-called "green tinctures" and "saturated tinctures" are made in a similar manner.

5904. Mixed Spices.

(Manlius.) Here is a formula from the *Era Formulary*.

Coriander	16 ounces.
Pimento	4 ounces.
Caraway	4 ounces.
Cinnamon	2 ounces.
Mace	2 ounces.
Cloves	2 ounces.
Nutmeg	2 ounces.
Turmeric	1 ounce.

Finely powder and mix thoroughly. Mixed spices as found upon the market vary greatly in their composition and the proportions of their ingredients as made by different manufacturers. The spices generally used are the white and black peppers, allspice, ginger, mustard seed, coriander, celery seed, cloves, mace, caraway, cinnamon, bay leaves, etc. Pepper, allspice and the ordinary spices are usually in larger proportion than the other ingredients.

5905. Permanent Emulsion Cod Liver Oil with Hypophosphites.

(F. O. F.) There are some formulas in the National Formulary as good as can be found anywhere. We speak this from experience founded upon a trial of nearly every process or formula that came under observation. A formula is given in the book named for an emulsion where each of the various emulsifying agents, acacia, glycofin, Irish moss, dextrine, quillaya, etc., are employed. These formulas may be modified or combined with hypophosphites or other salts as desired. You will also find in connection with the subject of emulsions a number of formulas for flavoring, given on page 40 of the same work. It is suggested you try the formula in which acacia is used as the emulsifying agent, and flavor with one of the formulas cited.

5906. Kidney and Liverwort Tea.

(M. F.)
Liverwort, herb, cut.... 8 ounces.
Dandelion root, cut..... 4 ounces.
Digitalis, cut..... ½ ounce.
Hydrangea root, cut..... 2 ounces.
Wintergreen, cut..... 1 ounce.
Peppermint, cut..... 1 ounce.
Powdered potassium nitrate

Mix thoroughly, and put in packages, holding about 2 ounces. Steep the contents of the package in a quart of water, with gentle heat, for two hours, then strain off 1½ pints and add to it half a pint of alcohol and 2 ounces of sugar. Dose of this preparation, a wineglassful four times a day.

5907. Butter Color.

(E. R.) The particular butter color you name was examined some years ago by Prof. A. R. Leeds, who reported that it yielded 4.80 per cent of coloring matter. "The reactions given by the color were those of annatto. The solvent gave the tests for cottonseed oil."

Annatto is the coloring material almost universally employed in the manufacture of butter color. Turmeric is sometimes added to modify the shade. These dye-drugs are extracted by boiling or by

maceration in cottonseed oil, lard oil, or other similar menstrua. Among the published formulas are the following:

Anatto seed 15 pounds.
Cottonseed oil 10 gallons.
Heat the oil to a temperature of 212 degrees F., add the anatto seed, and allow to macerate for 12 hours. Let settle, and pour off the clear, dark-colored oil.
(2.) Anatto seed 6 ounces.
Turmeric 6 ounces.
Good lard oil 1 gallon.

The coloring matter and the lard oil are boiled together for some time, and when cool the mixture is strained through a cloth.

For additional formulas see formulas Nos. 4879, 4880 and 4882, Era Formulary.

5908. Glycerole of Pepsin.

(F. O. F.) We know of no better formula than that given in the National Formulary, page 62, under the title "Glyceritum Pepsini." Here are also several others:

Pepsin in scales 64 grains.
Concentrated lactic acid 2 fl. drams.
Water 8 fl. ounces.
Glycerine 8 fl. ounces.

Rub the pepsin to a powder and then with the water and glycerine previously mixed, add the lactic acid and allow to stand a few days, with occasional agitation, then strain or filter.

The following is from an English authority:

Hydrochloric acid 1 dram.
Pepsine 256 grains.
Diluted alcohol,
Glycerine,
Concentrated orange
flower water, equal
parts of each to make
the whole measure 16 ounces.

5909. Sulphuric or Muriatic Acid in Vinegar.

(Manlius.) Sulphide of zinc has been recommended as a test for the presence of sulphuric or hydrochloric acid in vinegar. It is not decomposed either by dilute or strong acetic acid, but very easily by the mineral acids. If, therefore, pure vinegar is heated with a little zinc sulphide in a test tube, it will not give off the smell of sulphydric acid.

(3.) A test recommended by Hager is carried out as follows: One large or two small drops of gurgun balsam are mixed with 35 to 40 drops of pure acetic acid in a small test tube, heating and shaking to secure a uniform mixture. On the additions of two, or, at most, three drops of the suspected vinegar, the presence of hydrochloric acid is revealed by an immediate blue violet color, whilst in the presence of free sulphuric acid the reaction takes place somewhat slower. The test is a very simple one and can be made within a period of two or three minutes.

(3.) Bergman's test takes advantage of the fact that oxalate of calcium is insoluble in acetic and tartaric acids, but soluble in mineral acids. Take 5 cubic centimeters of the liquid to be examined and 5 drops test solution of oxalate of ammonium, and then 10 drops test solution of calcium sulphate. In the absence of free mineral acids, a precipitate of oxalate of calcium will occur (either at once or after awhile); if, however, mineral acids be present, the liquid will remain clear. It is claimed that so little as one-half of 1 per cent of free sulphuric, ni-

tric and muriatic acids can be detected by this test.

See also issues of the Era, January 1, 1893, page 9, and August 1st, 1893, page 111, for additional information upon the subject.

5910. Kidney Remedy.

(G. I. B.) The formula which you desire is not available. Following, however, are several formulas for this class of preparations which may be of service to you:

Liverwort 4 ounces.
Jamaica dogwood 1 ounce.
Ergot 2 ounces.
Couch grass 4 ounces.
Wintergreen 2 ounces.
Potassium nitrate 1 ounce.
Alcohol 2 pints.
Glycerine 12 fl. ounces
Water, enough to make 1 gallon.

Grind the drugs to No. 20 or 30 powder, percolate with all the glycerine and alcohol mixed with 2 quarts of water. When that has all passed, add enough hot water to make 1 gallon, and in which dissolve the potassium nitrate.

(2.)

Liverwort 16 ounces.
Dandelion root 8 ounces.
Digitalis leaves 1 ounce.
Hydrangea 4 ounces.
Wintergreen 2 ounces.
Potassium nitrate 3 ounces.
Sugar 12 ounces.
Alcohol 1 1/2 pints.
Menthol 5 grains.
Water, sufficient to
make 1 gallon.

Grind the herbs, etc., to a coarse powder, and having mixed the alcohol with 4 pints of water, moisten the powder with 2 pints of the mixture and macerate in a covered vessel for 24 hours. Then percolate until 7 1/2 pints of the mixture have passed in which dissolve the potassium nitrate and the sugar. The mixture may also be made from the fluid extracts of the drugs, the formula is as follows:

Fluid extract liverwort 16 fl. ounces.
Fluid extract dandelion 8 fl. ounces.
Fluid extract hydrangea 4 fl. ounces.
Fluid extract digitalis 1 fl. ounce.
Essence of wintergreen 1 fl. dram.
Potassium nitrate 3 ounces.
Sugar 12 ounces.
Alcohol 10 fl. ounces.
Menthol 5 grains.
Water 5 pints.

Mix the fluid extracts, alcohol, and water, add the essence of wintergreen and menthol, dissolve the sugar and potassium nitrate in the liquid, and filter.

5911. Dyspepsia Pills.

(G. C. J.) A careful search fails to reveal the formula you desire. Dyspepsia is a very general term and covers a great number of pathological conditions. Of course no one remedy can be devised which will meet the symptoms and be applicable to every case. Among the pills prescribed for these various conditions may be enumerated the so-called "dinner" pills, formulas for a number of which may be found in the National Formulary. Another pill whose formula is given in the same work is that found under the title "Antidyspeptic Pills." Pepsin in its various forms is often prescribed in cases of indigestion either singly or combined with bismuth, strychnine, etc., as in the following formula:

Pepsin 1 grain.
Bismuth subnitrate 5 grains.
Strychnine 1-60 grain.

For one pill.

Here are several other formulas compiled from various sources:

(1.) Fothergill's Antidyspeptic Pill:
Strychnine 1-20 grain.
Ipecac 1/2 grain.
Black pepper 1 1/2 grains.
Extract guthrie 1 grain.

For one pill.

(2.) Hallie's Indigestion Pills:

Extract aloes 20 grains.
Powdered ipecac 8 grains.
Powdered ginger 1/2 dram.

Divide into 16 pills.

(3.)

Extract quassala 2 drams.
Extract conium 10 grains.
Iron subcarbonate 10 grains.
Fowler's solution 10 drops.

For 10 pills.

5912. Pancreatin in Digestive Preparations.

(J. J. M.) Pancreatin is claimed to be an ingredient of many of the so-called digestive preparations on the market, though to what extent it is actually found in them, we are unable to say. Pancreatin as now understood, consists of four ferments, viz.: Pancreatic diastase, the amylolytic ferment, trypsin, the proteolytic ferment, a fat emulsifying, and a milk curdling ferment. Physiologically it is an active digestive of protoid and amyloid foods, converting protoids into peptones, and emulsifying fats. In the presence of an alkaline solution. In this respect it differs from pepsin, which requires an acid solution. Its therapeutic value in certain pathological conditions is a question for the physician rather than the pharmacist. We are aware, however, that it is often prescribed in cases of intestinal dyspepsia and it, or food predigested by its action, would seem to be indicated in cases of enfeebled digestion due to severe and prolonged illness and wasting disease. It is generally believed that the beneficial effects of pancreatin are best secured by causing it to act on the food before it enters the stomach, since the acid normally present in that organ tends to suspend its activity until it passes into the duodenum, the pancreatin itself being digested and lost. Upon this ground a point may be raised against the use of pancreatin in the formula you send, which, by the way, is almost identical with that given in the National Formulary, page 111, for compound powder of pepsin, in that it is combined in an acid solution. In the National Formulary a full working formula may be found for the preparation of pancreatin and tests for determining the proteolytic activity of the same.

5913. Tetraethylammonium Hydrate.

(F. L. N.) is a preparation that has lately been brought forward as a remedy for acute articular rheumatism. It is obtained (Roscoe and Schorlemmer) by gradually adding freshly precipitated silver oxide to a weak warm solution of tetra ethylammonium iodide, which is the starting point for all the tetra ethylammonium compounds. Tetra ethylammonium iodide is produced by the action of ethyl iodide on ammonia or on the ethylamines. If the filtrate, in the preparation of tetra ethylammonium hydrate

by precipitation with silver oxide from the iodide, be evaporated first on a water bath and then in a vacuum, long very deliquescent needles are frequently obtained. These disappear on further evaporation, the compound drying up to a semi-solid deliquescent mass which in its reactions closely resembles caustic potash, absorbing carbonic acid gas from the air, is strongly alkaline and saponifies fats. Concentrated, it burns the tongue. It is as bitter as quinine, has a caustic action upon the epidermis and a greasy unctuous feel when rubbed between the fingers. Tetra ethylammonium hydrate when heated alone decomposes into triethylamine, ethylene, and water. As a therapeutic agent it has been highly recommended by Dr. Peterson (N. Y. Med. Jour.) as a solvent for urea, uric acid, and the like. According to his statements a 10 per cent solution may be safely employed internally in doses of ten to twenty minims three times daily, and it may be used hypodermically in 1 per cent solutions. He believes it may also prove useful in the place of solutions of lithia salts when applied on positive galvanic electrodes about gouty joints or rheumatic concretions.

5914. Swedish Remedies.

(Bass.) "Slag Vatten" is a Swedish domestic remedy for fits. It is prepared by distilling equal parts of rosemary and lavender flowers with dilute alcohol. Sometimes gold leaf is put in the bottle when dispensed, in order that it may be more effective. Ordinarily, spirit of lavender is dispensed for this preparation. "Koleick Droppar" may be translated "colic drops," for which any one of a number of remedies may be dispensed. Hager gives the following:

(1.)

Oil chamomile	20.0 grams.
Oil peppermint	1.2 grams.
Oil caraway	0.3 grams.
Oil fennel	0.3 grams.
Oil cumin	0.3 grams.

(2.)

Oil chamomile	100 grams.
Oil rosemary	6 grams.
Oil thyme	6 grams.
Oil caraway	3 grams.

(3.) "Krampf Tropfen."

Valerian	4 troy ounces.
Galanga	2 drams.
Compound spirit ether	4 fl. drams.
Spirit cinnamon	2 drams.
Red saunder	20 grams.
Water and alcohol, of each, enough to make	2 pints.

(4.)

Spirit ether	10 grams.
Spirit nitrous ether.....	20 grams.
Tincture castor	20 grams.
Tincture opium	20 grams.
Tincture valerian	20 grams.

The other preparation you name is probably a Swedish domestic remedy, the exact composition of which we are unable to make out.

5915. Alterative Remedy.

(W. P. J.) We are unable to furnish you the formula at the present writing. Most of the blood purifiers and sarsaparillas on the market are also known as alteratives. One of the best compounds of this class of remedies is the compound elixir of corydalis of the National Formulary. Here are several other formulas:

(1.)
Tincture prickly ash bark 10 drams.
Fluid extract burdock... 2 ounces.
Fluid extract poke root... 2 ounces.
Fluid extract stillingia... 2 ounces.
Fluid extract sarsaparilla
enough to make 3 pints.
Dose, teaspoonful three times a day.

(2.)
Sarsaparilla root 1 pound.
Burdock root 1 pound.
Dandelion root ½ pound.
Mandrake root ¼ pound.
Rhubarb 2 ounces.
Red clover blossoms..... ½ pound.
Boiling water, about.... 3 gallons.
Steep over a slow fire for 12 hours.
Strain through a fine cloth and, while still hot, add granulated sugar, 5 pounds.
If it does not dissolve, add a little more heat. Then take

Potassium iodide..... 2½ ounces.
Alcohol, 95 per cent.... 1 quart.
Mix all together and add water to make 4 gallons. Dose, tablespoonful three times a day after meals.

(3.)
Fluid extract sarsaparilla 1 ounce.
Fluid extract stillingia... 1 ounce.
Fluid extract yellow dock 1 ounce.
Podophyllin

In the Era Formulary a great variety of formulas for alteratives and blood purifiers may be found.

5916. Liquid for Bronze Paint.

(X. Y. Z.) For a bronze paint, the bronze is suspended in a vehicle adapted to the special use to be made of the paint; where the object painted is likely to be exposed to dampness some thin varnish is required. A solution of sodium silicate has been recommended very highly for this purpose and would probably answer in most cases.

A preparation under the name of "Durable Liquid Bronze" is made according to a German patent as follows: Melt together 3 parts of gum dammar with 1 part of potassium or sodium bicarbonate, and continue heating on a water bath, stirring constantly, for three days. After cooling reduce the mass to powder, then dry, in thin layers, at a temperature of 50° C. This powder is then dissolved in petroleum benzine previously neutralized by passing through it ammonia gas. It is said that bronze powders suspended in this varnish will retain their luster for a long time.

Pour over 100 parts of dammar and a few pieces of glass in a bottle 900 parts of benzine. Pour off the solution from the fine sediment and glass, and suspend in it 300 to 400 parts of bronze powder. This is said to stand the action of water and may be washed.

5917. Depilatory Powders.

(C. M. H.) Most of the preparations on the market for the removal of superfluous hair are similar in composition to those made from the following formulas taken from the Era Formulary:

(1.)
Powdered quicklime 10 grams.
Barium sulphide..... 10 grams.
Starch 10 grams.
The powders are mixed and moistened with a little water, and then applied. It acts in a few minutes and is then removed

by scraping with a paper knife or similar blunt instrument.

(2.) Mix lime and water to a thick cream, and pass through the mixture 25 or 30 times its volume of sulphuretted hydrogen gas. When the gas escapes, stop the process. The pulpy mass is spread on paper, and applied for 10 or 15 minutes, and then washed off with sponge and water.

(3.) Chinese Depilatory:
Quicklime 16 ounces.
Pearlash 2 ounces.
Liver of sulphur 2 ounces.
Reduce it to a fine powder and keep it in a well-closed bottle.

Unless these remedies be employed under the supervision of a competent physician their use should be discouraged. At best great caution should be exercised in their employment as there is no preparation or application for the purpose that is absolutely safe and not attended with some degree of danger.

5918. Shaving Soap.

(D. J. N.) The requirements which determine the fitness of a soap for shaving purposes may be summed up as follows: The soap must yield a strong, thick lather, which should remain as long as possible without drying; it must be mild in use, and must keep a long time without turning rancid. To make a soap of the characteristics mentioned, great care and the best of materials are required. The stock most suitable is clean, hard, fresh tallow of the best quality and about 10 to 20 per cent of cocoa nut oil. The lye used is partly potash (say three parts soda lye and one part potash lye). Too large a proportion of cocoa nut oil causes the froth to dry up rapidly and fails to render the hair soft enough for shaving; the potash lye causes the soap to yield a better lather than a pure soda soap, as it produces the froth more rapidly, while a soap made entirely with soda lye yields a poor lather, which is silmy rather than frothy. For the further improvement of the soap, an addition of gum tragacanth is often made, which serves to bind the soap together and also makes it very mild in use, and improves the lathering qualities. Bassorin, a constituent part of some gums, has been used in the same way. The gum tragacanth is incorporated with some of the hot fat, when the soap is made by the cold process. From 1 to 2 pounds of the powdered gum to a frame (about 1,000 pounds) will make a noticeable improvement. Here are several formulas for cold made shaving soaps, taken from "American Soaps" and with which gum tragacanth may be incorporated:

(1.)

Tallow	400 pounds.
Cocoanut oil	50 pounds.
Soda lye, 38° B.....	200 pounds.
Potash lye, 38° B.....	25 pounds.

(2.)

Tallow	350 pounds.
Lard	50 pounds.
Cocoanut oil	100 pounds.
Soda lye, 37° B.....	220 pounds.
Potash lye, 32° B.....	60 pounds.

(3.)

Tallow	300 pounds.
Cocoanut oil	40 pounds.
Soda lye, 37° B.....	150 pounds.
Potash lye, 33° B.....	24 pounds.

The stock is melted and strained and allowed to cool to 100° F., when the lye (previously mixed) is added. The soap

is lightly perfumed with a composition somewhat as follows:

(1.)	Oil lavender	15 parts.
	Oil geranium	3 parts.
	Oil caraway	10 parts.

(2.)	Oil lavender	15 parts.
	Oil thyme	10 parts.
	Oil caraway	8 parts.
	Oil bergamot	2 parts.

(3.)	Oil lavender	8 parts.
	Oil sassafras	6 parts.
	Oil citronella	4 parts.

If gum tragacanth is to be added, it is previously mixed in some hot fat, taking care to get out all the lumps, and added to the stock in cretching. Of course, enough lye for the additional fat so used must be added.

5049. Preserving Orange Juice.

(W. E. P.) Ripe and carefully selected oranges are taken, the skins and seeds removed and the pulp crushed and pressed out. The juice as it comes from the fruit must be clarified, which may be accomplished by several methods, viz., heat, fermentation, etc. The juice when clarified by heat, is heated to about 80° or 90° C., when a solution of white of egg is added. It is then skimmed and filtered. Clarification by fermentation is based upon the transformation of sugar into alcohol, which tends to insure the preservation of the juice. By this method the juice is placed where the temperature varies from 20° to 25° C., until it is transformed into wine, forty-eight hours being usually sufficient. When the fermentation is finished, the liquid is filtered.

After clarifying the juice, it may then be preserved by one of several methods. Here is a process from the Era Formulary:

The clarified juice is heated to boiling in a copper vessel and then poured into a dish. Meanwhile the bottles are provided with stoppers, and are then gradually filled, a space of about two centimeters in the neck being left empty; some alcohol is then poured upon the hot liquid, and the bottle is quickly stoppered, the cork being further secured as the liquid cools. The alcohol which evaporates into the empty space is sufficient for the preservation of the liquid. The juice of fresh herbs may be preserved in the same manner.

Another process similar to the one just given is called the "Appert Method." It is the most convenient method and with some kinds of juice works very well. The clarified juices are bottled in stone or glass bottles and corked and wired, they are then carried in a rack to a hot water kettle of sufficient size to allow the liquid to cover the bottles. The water is heated to the boiling point, and after a few seconds the source of heat is removed and the water is allowed to cool down, when the bottles are removed.

Antiseptics of various kinds such as sulphurous, boric, benzoic, formic and salicylic acids have also been recommended and are no doubt used to a very large extent for the preservation of the different fruit juices. Boroglyceride, sulphite of sodium and peroxide of hydrogen are also used. It has been maintained, and justly so, that antiseptics like the above should not be employed in articles of diet or drink for hygienic reasons, and there has always been more or less discussion

as to how injurious they might become when taken into the system in small amounts continuously. Upon these grounds the French government has prohibited and adopted severe penalties to their uses. For further remarks upon the subject see Era of September 15, 1893, page 256, and Era of October 15, 1893, page 315.

5020. Recognition of American Registered Druggists in Germany.

(P. W. G.) asks if a druggist registered in several states in this country can practice or work at the drug business in Germany. Not by reason of such registration. In Germany the laws governing the practice of pharmacy are much more stringent and thorough than in this country. Here are a few of the things the German pharmacist must undergo before he has the right to make application to the government for a license to practice upon his own account. In beginning the business the would-be apprentice has to give evidence of having attained a certain standard of school education and the term of apprenticeship is not less than two years if the youth have matriculated at a university, or three years for such as have qualified themselves for the one year's military service. Pharmacists rarely take more than one apprentice at a time and they really undertake his scientific and technical training. During the apprenticeship he has to acquaint himself practically with his calling and theoretically with the various associated sciences. At the expiration of the three years the novice enters for the first technical examination.

The examinations are conducted by special committees at the universities and include laboratory work, analytical chemistry, physics and a knowledge of the laws specially affecting pharmacists. The first examination is not only viva voce but practical and written.

This certificate entitles the holder to rank as an assistant, at which he has to serve another three years, after which he studies eighteen months at a university. The subjects here studied, many of them comparatively exhaustively, are chemistry, organic and inorganic, analytical and forensic, physics, botany and materia medica.

The final examination extends over six weeks or two months. It is written, practical, and oral, and embraces all the different branches of science mentioned above. The successful candidate is entitled to manage or own a pharmacy if he can obtain a license from the government to do so, in a locality where the increase of population is sufficient to warrant an addition to the existing number of pharmacies or "Apotheken." The applications for such licenses, however, are so numerous that unless one has powerful influence the chances are heavily against success, and the pharmacist has to be content to continue as an assistant or enters some other profession or calling.

5021. Snow Globe Colors.

(J. B. S.) Here are some formulas taken from the Era Formulary:

Canary—
Make a solution of picric acid in alcohol and add to water to form the desired shades.

Yellow—
Sesquichloride of Iron..... ½ pound.
Hydrochloric acid 1 quart.
Dissolve and dilute with water.

Amber—
Dragon's blood, in coarse powder 1 part.
Sulphuric acid 4 parts.
When thoroughly dissolved, dilute with cold distilled water till the required tint is obtained.

Blue—
Distilled water 90 parts.
Blue vitriol 30 parts.
Alum 30 parts.
Sulphuric acid 20 parts.

Dark blue—
Distilled water 500 parts.
Ammonia water 40 parts.
Sulphate copper 10 parts.
Any desired shade can be obtained by varying the proportion of ammonia and copper salt.

Dark blue—
Sulphate copper 160 grains.
Solution potash 1 pint.
Glycerine ¼ pint.
Water 16 pints.

Dissolve sulphate of copper in sufficient water, add to the solution potash, then glycerine, until complete solution results. Finally add the remainder of the water.

Green—
Dissolve several large copper pennies and a nickel in nitric acid. This solution, when diluted with water, furnishes a beautiful permanent green color, which can be adjusted to any desired shade by varying the proportion of diluent.

Pink—
Cobalt oxide 1 gram.
Nitric acid 49 grams.
Water to make 1,000 grams.
Dissolve the cobalt in the acid, then add the water.

Bright red—
Distilled water 970 parts.
Sulphuric acid 10 parts.
Cochineal 8 parts.
Alum 8 parts.
Pure cream tartar 4 parts.

Carmine—
Carmine 3 to 5 grains.
Chloride of tin 3 to 5 grains.
Water of ammonia 1 dram.
Water enough to make 8 pints.
Dissolve the carmine in the water of ammonia; add the chloride of tin and water.

Purple—
Sugar lead 3 ounces.
Powdered cochineal 1 dram.
Water, quantity sufficient.

Violet—
Mix together solutions of nitrate of cobalt and sesquicarbonate of ammonia, adding a sufficiency of ammonio-sulphate of copper to strike the required color.

See also Era, February 15, 1893, page 158, for a formula for the so-called "multi colors" for show globes.

Formulas Wanted.

(C. M. H.) Hukka Cream.
(G. B. B. & H.) Kilmer's Swamp Root.

CHEAP METHOD OF FINISHING FLOORS. Mix burnt sienna with petroleum, and apply freely. This method is objectionable from the point of view of fireproof qualities, but has the advantage of being very cheap, while the appearance is not at all objectionable. Another very cheap method is to add a very little Brunswick black to boiled linseed oil. This gives a rich brown color that will dry hard, and if it be at, say, the end of every year removed, the floor will always look in good order.

THOMAS S. WIEGAND.

A READY willingness always displayed in helping both the individual interests of the members of the profession of pharmacy and the profession itself as a whole has placed the name of Thomas S. Wiegand among those whom the pharmacists of the country delight to honor. Mr. Wiegand has been known for the last thirty years by the large number of those who are proud to write "P. C. P." as an addition to their usual pharmaceutical degrees, as Actuary and Librarian of the Philadelphia College of Pharmacy, and to the world at large he has been no less well known by his scholarly contributions to the literature of the profession. Mr. Wiegand was born in 1825, and after receiving a fair preliminary education he entered, at the age of 14, the drug store of Haskell & Merrick, of Philadelphia. In 1844 he became a graduate of the Philadelphia College of Pharmacy, and in the following year he was appointed apothecary of the United States Naval Hospital, Brooklyn, N. Y. He remained in the service of the government nearly three years, and at the expiration of this time he returned to Philadelphia. After two years' service in the store of Frederick Brown he started in business on his own account, which he continued for a number of years until impaired health demanded a change from the onerous duties of the retail pharmacy. This experience, in a measure, explains the hearty sympathy which has always characterized his efforts in aiding, in a practical way, those who serve the public in the capacity of retail pharmacists. Mr. Wiegand then took charge of the pill department of Bullock & Crenshaw, Philadelphia, with whom he remained sixteen years, when he was elected to the position he now so ably fills. It is in this position that he has, by a rare combination of personal

qualities, endeared himself to a wide circle

of friends who have yearly passed from the doors of the college to engage in their chosen vocation. It has been remarked that Mr. Wiegand makes several hundred firm friends each year, and the appellation "Uncle Tommy" is one which is applied to him by every student with whom he comes in contact as one of affectionate regard, showing an appreciation of an assumed relationship which is marked by kindly advice and lasting friendship. Mr. Wiegand's contributions to the literature of pharmacy have, with a few exceptions, appeared in the American Journal of Pharmacy, and his reputation as a careful and painstaking writer finds a firm foundation in the later editions of Farrish's Pharmacy, which he revised and, to a great extent, rewrote. The proceedings of the American Pharmaceutical Association also show numerous articles bearing his name.

NEWS COMMENT.

Users' drug store at Galeton, N. Y. was burned recently. The loss is estimated at \$1,000, with \$2,500 insurance. The fire was supposed to be the work of an incendiary.

West & Truax, wholesale druggists of Toledo, were heavy sufferers in the disastrous fire which occurred in Toledo January 4. The losses figure about \$75,000, with about \$15,000 insurance. The firm permanently retires from business and will be succeeded by the Toledo Drug Co., a concern incorporated at Lansing, Mich., the principal stockholder, E. D. Peck, being a former member of the West & Truax Co.

Gustave A. Liebig, Ph. D., prominently identified with the chemical industries of Baltimore, died at his home in Baltimore County, Md., December 17. He studied pharmacy with Baron Berndt, in Prague, and later entered the Carolinum, the oldest university of Germany, graduating in 1849 as doctor of philosophy. He came to the United States in 1856, landing in New York, where he remained two years. He then removed to Baltimore.

An explosion which resulted in the loss of two lives occurred in Procter & Gamble's glycerine works, Cincinnati, December 28. It was caused by the bursting of a tank in the digester-house, which is used to separate the glycerine from the grease. It was thirty feet high and four feet wide. So great was the force exerted that part of the tank was sent through the roof of the building, three stories high. The loss is estimated at \$1,500.

Following the lead of the Michigan Board of Health, the members of other state boards of health have been investigating the system of disposing of excreta by the dry closet method. The committee appointed by the Iowa State Board of Health to investigate the subject reported that, in twenty-six replies to letters addressed to seventeen different cities, six were in favor of the system, fifteen considered it unsatisfactory, and five expressed no positive opinion. From its own investigations the committee condemns the system for the following reasons: The drying of the excreta and ventilation of the closets depend wholly upon the ventilation of the building—the uninterrupted and continuous flow of air in one direction. This, under all circumstances, was impossible, as adverse winds or even opening of a door may cause a reversal of the air current, there being no means of preventing back drafts. Neither does the so-called dry closet always remain dry, an objectionable feature. Another point against it is the excreta is never subjected to any sufficient degree of heat to destroy possible disease germs when desiccation of the material in the vault occurs. In this way the desiccated material, when drawn up through the ventilation shaft, may become a source of contagion to the surrounding community and even to the occupants of the building by contaminating the air as it is drawn into the fresh air ducts, should it be infected by the microbes of typhoid fever, diphtheria or other contagious diseases. The dry closet system, as it is now constructed, is not the best means of caring for excreta of school buildings when proper sewerage or other approved methods are obtainable.

The London correspondent of the Medical Record, in his report of the recent meeting of the General Medical Council, says: "Perhaps the most interesting subject of discussion on your side of the Atlantic will be the approach toward an International Pharmacopoeia. The medical authorities of India and the colonies have been in communication with the council as to their wants, and, as a new edition of the British Pharmacopoeia will be wanted in about a couple of years, it will not improbably be adopted for the empire as far as the committee can manage. I wonder if America will some day join in this work so as to have a codex for the English-speaking world." For the benefit of the correspondent and the General Medical Council, we would state that the American Pharmaceutical Association, since its last annual meeting in Chicago in August, 1893, has been carrying a chip on its shoulder in the shape of \$1,000 which it appropriated for the purpose of aiding in the work of bringing out an International Pharmacopoeia. Talk about America joining! America has already joined and is busily engaged hunting for converts.

The trial of Jennie Carr, a colored woman of Marion County, Ind., accused of killing her 3-months-old child by giving it morphine in milk, has been watched with great interest by medical and chemical experts. The accused was first convicted upon the evidence of a physician formerly associated with the coroner who conducted the inquest. In his statements to the jury he testified that he had found morphine in the stomach, blood, spleen and other organs of the child in enormous quantities. Conviction followed and the woman was sentenced to life imprisonment. Upon an appeal, the Supreme Court of Indiana set aside the verdict of the lower court and ordered a new trial in another county. At the second trial experts were introduced by the defense, whose testimony put to rout the claims of the doctor upon whose evidence the woman was convicted. The experts for the defense also testified that the report of the doctor's examination was in large part copied from Elyth's Toxicology and Atfield's Chemistry. It was alleged that the milk which the child drank contained only about three-eighths of a grain of morphine, and from which the expert for the prosecution claimed that he had made over one hundred tests for poison. Experts on the other side claimed that it would have hardly been possible to make ten color tests for morphine with such a small quantity, to say nothing of making one hundred tests. The defense also demonstrated to the satisfaction of the jury, that such color tests as were made to prove the presence of morphine might also be made for ptomaines. Among the experts employed by the defense was Dr. V. C. Vaughan, of Michigan University, who testified that, upon careful examination of the evidence and report made by the expert employed by the prosecution, he was of the opinion that no chemist could make all of the tests in a case of morphine poisoning and obtain morphine in sufficient quantity and purity to produce results with such distinctness as was claimed in the report. The second trial lasted about a week and the jury very quickly returned a verdict of not guilty.

NEW YORK.

New York, January 11.—The improvement in business previously reported continues, and in gripe seems to be on the increase. The drug trade has not escaped this malady, as quite a number in wholesale drug circles are victims of it. The retailer is too busy to think of taking it, and if the general drug business was as good as the prescription business extra help would be needed to take care of it, but the buying is for actual necessities only, showing that the people are carefully guarding their surplus cash. Business in the smaller stores is better than in the larger ones. The popular remedies sought as cures for la gripe by those who do their own doctoring are quinine, phenacetine, porous plasters and whiskey. The pharmacist who was thoughtful enough to put up a grip remedy is now reaping the benefit of his forethought. In a small eastside pharmacy upwards of four dozen bottles were sold in a week.

T. E. Fraser, Fifty-fourth street and Second avenue, has been a victim of an employer's dishonesty. Cases of this kind have been very numerous of late, but no prosecution has taken place the proprietors preferring to let it go rather than to be troubled with going to court; but Mr. Fraser preferred to make an example of his case and push it to conviction. The culprit in question was the colored porter of the store. The credit of detecting the thief is due to Mrs. Fraser, who at the time was acting as cashier, the regular cashier being ill. She noticed, as he was about to leave the store, that his pockets were slightly bulged out, and becoming suspicious that all was not right, called him back and gave him some work to do which necessitated the removal of his coat, and while he was engaged at this they examined his coat and found about \$30 worth of goods secreted in the different pockets. A policeman was called and the porter was locked up. The case came before general sessions, and a sentence of four months and a fine was imposed. This is the fifth similar experience Mr. Fraser has had, but this is the first time he has prosecuted, and he thinks if his brother pharmacists would do likewise there would be less of it going on.

Considerable excitement has been caused in Brooklyn by the controversy between the Board of Education and the homeopathic physicians over the non-acceptance at the schools of certificates of vaccination of pupils treated by a new homeopathic method, which is the administration, internally, of a preparation called variolin as a substitute for vaccination. This remedy is said to be the highly attenuated matter taken from a pustule of small-pox, which, it is claimed by the allopaths, is taken in so minute a quantity that the medicine would be ineffective, because it would be digested and thrown from the body through the natural channels. The claims of the drug will be fully investigated. In the meantime the Board of Education will refuse these certificates until the Health Board reports.

Mount Vernon is in revolt over the high license imposed on druggists for the sale of alcohol, and only one store has taken out a license to sell it. This throws the trade to the grocer, who takes out the license for the sale of liquor. Considerable annoyance is caused to the people, who have always been in the habit of buying it from the drug store, but the

amount of the license imposed would entail considerable loss upon the pharmacist, as there is never any real profit in selling the article. The one licensed pharmacist is doing a thriving business in the article.

The report of the Health Board shows this city to have been particularly healthy during the past season, and the deaths from contagious diseases are fewer than for some years past. The deaths given are: Diphtheria, 1,944; typhus fever, 190; typhoid fever, 577; scarlet fever, 552; measles, 885, and small-pox, 98. The death rate was the lowest since 1877. It was 23.46 as against 24.26 last year.

Francois Funtz has succeeded A. Grau at 311 Western avenue.

H. Hamerschlag, 119 N. Second, has sold out to W. H. Schatz.

J. Hautelmann has opened a new store at 786 Eastern Parkway, Brooklyn.

Col. Samuel Tilden, president of the Tilden Co., New Lebanon, N. Y., was in town recently.

A. Klipstein & Co. is the name of a new concern incorporated January 2. It will manufacture dyestuffs.

H. Friedland, East Broadway and Jefferson street, has opened a branch store at Jefferson and Henry streets.

Charles Davis, of Davis Bros., Carroll and Smith streets, Brooklyn, is spending the winter at his home, Picout, Ont.

The National Folding Paper Box Co. recently took judgment against the New York Food and Condiment Co. for \$524.

W. H. Bird has purchased Mervin's Pharmacy, 592 Third avenue, Brooklyn, having done relief work there for some time.

Carlisle's Pharmacy, Mt. Vernon, N. Y., has been moved across the street from the former location to more commodious quarters.

E. C. Duheine, for a number of years with H. J. Anable, has purchased Notcutt's Pharmacy, 531 Flushing avenue, Brooklyn.

Charles Woldneck has bought the store of Dr. Meyer, Lexington avenue and Fifty-fourth street, and is having it entirely renovated.

The well known firm of Geo. Lueders, Importer and dealer in essential oils and materials for perfumes, has been changed to Geo. Lueders & Co.

S. Schwarz, Broad street, near Greene, Newark, N. J., has opened a beautiful new store. One of the principal features is a handsome soda fountain.

S. Lipris, Essex and Canal streets, whose store was damaged by fire recently, will entirely renovate and restock it and continue at the same location.

C. P. Kinsella, 167 Main street, Paterson, N. J., has purchased the Odd Fellows Hall, the building in which his store is located. The purchase price is said to be \$45,000.

The Le Page Chemical Company has been incorporated at Albany with a capital stock of \$12,000. It will manufacture Venice turpentine and other chemical products in this city.

C. E. Reinhardt, recently representing Theodore Ricksecker & Co., in Brooklyn, has returned to his former position with F. Huhn, and is representing this firm in Brooklyn and vicinity.

The Union Chemical Works, 15 Cedar street, has made an assignment. Morris Sterne has been appointed receiver. The company has been insolvent for some

time, and is being wound up by the directors.

Joseph Gibian, for a number of years manager of Hermann's Pharmacy, Mulberry street, Newark, N. J., has opened an elegant store at the corner of High and Sussex streets, which he has named the Columbia Pharmacy.

S. L. Meir, for some time at Losee's Pharmacy, Broadway and Madison street, Brooklyn, has opened a new store at 417 Manhattan avenue, Greenpoint.

The store of A. J. Lynch, Fulton and Tompkins avenue, Brooklyn, has been sold to Mykrantz Bros., of Champagne Mist fame; this store was formerly owned by E. L. Blanding & Co.

J. Taylor Clarke, Thirty-third street and Avenue D, Bayonne, N. J., has purchased the store of A. H. Styles, corner Forty-third and Avenue D, Bayonne, and will run it as a branch of his old store.

The well known wholesale drug house of Bruen Bros. & Ritchie has been dissolved, owing to the death of Oscar Bruen. The business will be continued by the surviving partners under the firm name of Bruen, Ritchie & Co.

The dinner recently given to Mayor-elect Scheren, Brooklyn, was a very select affair, only 96 invitations being issued. The drug trade was represented by Wm. M. Davis, president of the Board of Pharmacy.

Geo. E. Wray, Yonkers, N. Y., has put in one of Tufts' latest and most elegant fountains, made of Mexican onyx, and while there are larger fountains than this, there are none handsomer. He has also had his store entirely redecorated in white and gold.

J. W. Edwards, Fifth avenue and Third street, has joined the ranks of benedicts, and has just returned from Chicago, where the wedding took place at the home of the bride's parents. On the return trip points of interest between Chicago and New York were visited.

L. Englehorn, who formerly managed the New York branch of C. F. Boehringer & Soehne, has returned to Germany, and the American branch house will be in charge of Dr. L. Schaefer, a director in the company, formerly located at the company's works at Waldhof, near Mannheim, Germany.

E. H. Hammer, vice-president of the Keasbey & Mattison Co., of Ambler, Pa., will hereafter be located at the factory and assist Dr. Mattison in the general management of the business. He will visit the New York office once a week. A. N. Cox will continue to look after the city trade as usual.

George McDermott, a member of the firm of Edward Hill's Sons & Co., the well known chemical house, died at his residence in this city December 24. He had entered the firm's employ when a boy, and by the faithful performance of his duties worked himself up until he became a member of the firm.

George Kempton, recently with Hudnut's pharmacy, Broadway and Ann streets, is again representing Theodore Ricksecker in New York City and vicinity. Although Mr. Kempton's position was a pleasant one, he found that inside work did not agree with him. He is well known as a salesman of ability and a pharmacist of experience.

Messrs. Griffin and Davie, clerk and librarian of the New York College of Pharmacy, on Christmas were presented with handsome silk umbrellas by the

students of the college. Mr. Griffin, having been sick with la grippe, the speaking was left to Mr. Davie, who thanked them in behalf of his associate and himself, wishing them success in the examinations to come.

The New York and New Jersey Telephone Company have issued an order compelling all druggists who rent telephones to institute pay stations and forbidding any further free use of the instruments for personal calls. Hereafter any one, except the subscriber and his employees, who uses the telephone must pay 10 cents for Brooklyn calls and 20 cents for New York calls.

Mr. Benjamin Altmeier, graduate N. Y. C. P., will soon open a new store on Smith street, between Fulton and Livingston streets, in the building of the new Bijou Theater, Brooklyn. It will be known as the Bijou Pharmacy. Mr. Altmeier is an experienced pharmacist and has been employed in some of the best stores in New York and Brooklyn. His last place was with Hardenberg & Angus, Columbus avenue and 75th street. He was formerly with Adrian Paradis, Brooklyn.

Robert R. Martin, until recently manager of the New York office of Sharp & Dohme, Baltimore, returned from a visit to the chief chemical centers of Europe to again go abroad, this time to London, where he assumes the position of manager with Oppenheimer, Son & Co., Limited, originators of palatinoid and bipalatinoid machinery, and who have a very large business throughout the world. He will also in a general way represent Sharp & Dohme in the foreign countries tributary to London.

Some months ago a prize microscope was offered by Seabury & Johnson to the member of any pharmaceutical association writing the best paper on "Substitution." A committee of award was appointed as follows: S. W. Fairchild, H. W. Atwood, T. J. Macmahon, of the New York College of Pharmacy, and on December 20 they decided that the paper of Addison Dimmitt, chairman of the executive committee of the Kentucky Pharmaceutical Association, was entitled to the prize, and it was so awarded.

The case of William Glockner, the Eighth avenue druggist, who was sued for damages by the brother of the deceased Munde, to whom was administered morphine in place of quinine by a youth employed in the store, came up for trial recently, and the case was dismissed by the jury. It was shown that at the time the mistake was made Glockner was in a lunatic asylum, and was not responsible, as the clerk was hired by the head clerk having charge of the store, the business being run in the name of Mrs. Glockner.

The series of lectures to be given at the New York College of Pharmacy under the auspices of the Alumni Association should receive the hearty support of the profession. All are cordially invited, and the subjects chosen by the different professors and speakers who will deliver the lectures show that they will be particularly interesting to pharmacists, as well as instructive, and should go a long way toward increasing the membership of the Alumni Association. The first lecture will be by Prof. Coblenz on the relationship between the chemical constitution and the medicinal action of the newer remedies. This will be followed by Dr. Rusby, Prof. Elliott and others.

BOSTON.

Hoston, January 11.—Dr. Timothy C. Bardeen died on the night of December 22 at his home in South Boston, after an illness of three weeks' duration. Inflammation of the bowels was the immediate cause of death. Dr. Timothy C. Bardeen was born in that section of Dorchester now known as Hyde Park, February 25, 1859, and spent his early life there, receiving a rudimentary education in the common and high schools. Shortly after being graduated from the high school he entered the employ of David Evans & Co., druggists of Hyde Park. After a four years' connection with this firm he entered the employ of John T. Kesley, a former pharmacist of Charlestown. At the end of a few years' residence in Charlestown he migrated from that district to South Boston, and he had since been a resident and prominently identified with that district. About six years ago he succeeded, and has since conducted and greatly enlarged the business of, William A. Morris, corner of West Broadway and N. streets, one of the oldest established drug stores in South Boston. In connection with the drug business Mr. Bardeen made a study of medicine, and although not a practicing physician, he has been commonly called by the title of doctor. In March, 1902, at a joint meeting of the Boston school committee and the board of aldermen, Dr. Bardeen was elected a member of the school board. With this exception, Dr. Bardeen never held a political office. He was a member of the ward thirteen ward and city committee, and a charter member of the Tammany Club. Several months ago he met with a serious accident, his carriage being run into by a car, and it is thought by many that he never recovered from the effects of the collision. At a meeting of the South Boston Druggists' Association, it was voted to close all the places of business of the members during the hours of 9 to 11 on the day of the funeral. It was also voted to send a delegation to represent the association. The Royal Arcanum, the Irish-American Club and the Tammany Club of ward thirteen also voted to send representatives. Seldom, even in South Boston, has there been such a great gathering of people as was present at SS. Peter and Paul's Catholic Church on Broadway, where the services were held, for Dr. Bardeen had been a kind friend of the poor and needy. A solemn high mass of requiem was celebrated. The interment was at Mt. Calvary Cemetery. The floral tributes were elaborate and beautiful.

There has been some little talk in the trade here recently over a circular letter issued by Weeks & Potter Co. in regard to the Detroit plan for the regulation of the sales of patent medicines. These circulars were distributed to the trade of this section and were in the nature of a protest against the plan, asking the retailers to signify their approval or disapproval of it. The objections advanced were that the plan was in the nature of a trust, the committee which is to designate what houses are to be customers of the manufacturers has too much power, and the retailer who has capital and a desire to buy in quantity lots is discriminated against. The visit of President F. A. Faxon and ex-President James E. Davis, of the N. W. D. A., was taken as a significant fact, and there has been much

animated discussion over the matter.

The "white list" of jobbers already issued by the N. W. D. A., includes for New England the houses of Carter, Carter & Kilham, Gilman Bros., Weeks & Potter, West & Jenny, Geo. C. Goodwin, Smith, Benedict & Co., Cutler Bros. & Co., Rust & Richardson Drug Co. and G. O. & J. G. Wilson, all of Boston; C. P. Alden, of Springfield; Bush & Co., of Worcester, and C. H. & J. Price, of Salem. Some surprise was created that the Theodore Metcalf Co. and Geo. S. Cheney & Co., of Boston, are not recognized, but the reason given is that the association does not consider either house a jobbing firm. A member of the latter house, while unable to understand this ruling, says it does not bother them much. When the Campton plan was brought into operation, finding that they were to appear on the black list, they wrote to the association regarding it, but received no reply, though three letters were sent. Their name appeared on the black list, and they found that they had no trouble in buying all the goods they wanted. Theodore Metcalf & Co. say application for admission to the N. W. D. A. was made some time ago, but was refused. They do not take a serious view of the matter. The senior member of one of the leading wholesale drug firms in Boston says there is no occasion for all the talk that has been made. He believes the circulars issued by the Weeks & Potter Co. were merely to advertise the firm by appealing to the sympathy of the retailers. He insisted that the retailers, as a rule, are in favor of the plan, that is, all of them except the cutters. He accuses the manufacturers of a lack of interest in the matter, and is afraid, judging from past experience, that cutters will have no difficulty in getting all the goods they want. A prominent cutter is anticipating a very strong fight, but expects to come out ahead. He characterizes the whole scheme as one to insure a profit to the wholesaler, and a selfish scheme at that.

Andrew G. Weeks, Jr., of the Weeks & Potter Co., is perfectly willing to discuss the matter, and says that "in order to get an idea of the opinions of the retail druggists of New England, as to whether they are willing to give up rights which their capital entitles them to, and which they would be obliged to give up under the original plan, we sent out our circulars and cards. The replies received covered some 30 per cent of the dealers in New England, and 60 per cent of the replies did not favor the plan, while 40 per cent of them expressed willingness to give up such rights in order to have the plan tried. Under the plan which has been submitted, our inquiry to the retailers may have seemed unnecessary, and our action in making the inquiry has been condemned on many sides. The fact that the plan was submitted does not necessarily mean that every manufacturer is going to follow the plan, and many might independently enter into it with a view of trying the plan as originally proposed. Such action we should heartily oppose, in accordance with the principles set forth in our circular. The plan, as modified, is, we think, a good one, and although we are opposed to the rebate system, we nevertheless shall urge all our friends in the trade to live up strictly to the contracts submitted by the manufacturers. Its complete working would undoubtedly result in hindering cutters

from securing supplies; but if any good results are to be obtained from it the manufacturers have not to be much more active in enforcing their contracts than they have ever been, and it will require considerable detective work, so to speak, on their part, which some leading manufacturers seem very slow to undertake, judging from our experience in the matter. Many wholesalers have criticized our circular because it did not strictly apply to matters as they stood at the time of its issue. In this they may be right, nevertheless, they failed to understand our object. We are always working for the benefit of the retailer, and we hope no action of ours will be considered as contrary to such interests."

There is certainly a humorous side to the affair. Houghton, Dutton & Co., who have an immense store where one may buy almost anything from candy and rubber boots to clothes lines and sets of Thackeray, have a drug department, where they sell patent medicines at 9, 19, 49 and 99 cents, and so on. Now Houghton & Dutton are becoming alarmed, and have issued the subjoined touching appeal.

"CARD TO THE PUBLIC."

"The old fight concerning the sale of patent medicines is revived, and this time the signs point decidedly to strife. The parties to this conflict are aligned as hitherto; it is Trust vs. Public, as it has always been. On one side are ranged the cutters, who by manufacturers of proprietary medicines with millions of dollars behind them. Against this insatiable combine are pitted a few dealers known to the public as 'cutters,' who are satisfied with a reasonable profit on these as on other goods. The purpose of the combination is to prevent the 'cutters' from obtaining any good whatever in this line of trade, so that the former outrageous prices may be restored. Is this a propitious season for such a movement? At a time when thousands remain unemployed, when the relief of prevailing destitution has become a grave official problem, when, as never before, the people are applying the stern lesson of self-denial, and when the unusual prevalence of sickness lays an additional burden upon them, we submit that it seems nothing less than a capital outrage for a combination of extortioners to attempt to force back the old prices of this trade. At such a time should necessities be dominated by the whims of a few? If the people have any rights whatever, ought they not, in such times at least, to be able to procure the supplies of the sick room without submitting to such domination? How can this purpose of the monopolies be defeated? Let the people who are affected by these prices refuse to buy from druggists belonging to the trust, then also obtain from the 'cutters' the names of such manufacturers as are leading the combine, and refuse to use their goods. Let the people remember that the object of this is a fight for cheaper prices. This is pre-eminently the cause of the people, and we make our appeal directly to the public. Will you sustain us, or will you surrender your rights and ours to the trust? Do you choose to pay an enormous profit on your drugs and medicines for the mere gratification of a few nabobs, or will you stand by those who are willing to supply these goods at prices not akin to highway robbery? In this war our interest are yours, and with your support we can win."

It will be interesting to see if the retail druggists are willing to go into a battle against this "insatiable combine," under the leadership of a house like Houghton & Dutton, which puts one in mind of a devil-fish in the way it puts out its antennae and sucks in trade which used to go to a hundred small stores before this firm had so many departments. Druggists generally do not become fond of these great establishments which take away trade legitimately belonging to druggists.

An important meeting of the state board of registration in pharmacy was held at 13 Beacon street to consider complaints lodged against William F. Tripp and Dr. E. A. Cardin, of Fall River, and Charles A. Shea, of Marblehead, for the violation of sec. 1, chapter 472, of the acts of 1893. This section prohibits any person registering as a pharmacist from permitting the use of his name, or his certificate of registration, by others in the conduct of the business when he himself is not the owner and actively engaged in such business; also from violating any of the laws of the commonwealth now under the supervision of the board of pharmacy, and especially the laws relating to the sale of intoxicating liquors. The board has the power, under this law, to suspend any person's registration as a pharmacist, and his certificate, for such a term as may be deemed fitting, and in flagrant cases the certificate may be revoked. These were the first complaints made under the new law, which went into effect last June, and much interest was manifested in the cases by druggists generally. The three alleged offenders were duly summoned before the board at its special session, but only Dr. Cardin appeared. President Whitney presided, and the meeting was held behind closed doors. The full board was present. In the first case it appeared that the certificate was obtained by the owner in 1885, two years after he had left the drug business, and while engaged in railroading. From 1883 to 1892 he had no connection with pharmacy in any way. In the latter year Tripp was approached by a man who was about to open a drug store, and wanted to hire or purchase his certificate. An agreement was entered into by which for the consideration of \$10 per month Tripp's certificate could be used. From the evidence in the second case it appeared that the certificate had been let for \$3 a day, and in the Marblehead case it was elicited that an agreement had been made by which a man not registered was to obtain a sixth-class liquor license, contrary to statute, the owner of the certificate being engaged in another kind of business in another city. After a review of the facts presented it was unanimously voted by the board that the certificates of William F. Tripp, Dr. E. A. Cardin and Charles A. Shea should be suspended.

H. F. Folsom & Co., druggists, Portland, Me., have failed.

At Berlin Falls, N. H., N. J. Marchand & Co. have opened a drug store.

Henry J. Goulding, of Oakland, Me., has opened a pharmacy at Corinna, in that state.

A new drug store has been established at Newport, Vt., with C. F. Davis in charge.

Island Falls, Me., adds to its list of business places a drug store, of which S. R. Crabtree is the owner.

E. J. Sawyer has opened a drug store at the corner of Washington and School streets, Egleston Square, Boston.

Charles H. Bradbury, 97 Cambridge street, Charlestown, has sold out to Albert H. Barnes and E. Willard Shaw.

Thieves entered the apothecary store of S. G. Cottrell, at 19 Chadwick street, Roxbury, and stole \$10 from the cash drawer.

J. C. Oxley & Co., druggists, of Wakefield, have bought out W. S. Bickford, of Reading, and are going to enlarge the place by taking in an adjoining store.

Edward Farrar has opened a drug store at Glenwood station, Mcford. It contains a Low fountain of beautiful design.

At the North End of New Bedford, J. H. Kenally will seek a fortune in a new pharmacy, of which he is the proud proprietor.

F. A. Shurtleff, South Paris, Me., whose drug store is a popular place in summer, has lately put in a new soda fountain.

Nelson M. Stetson, druggist, Newbury, Vt., has bought a soda fountain of Tufts. Pawtucket, R. I., has a new drug store, E. J. Slattey being the proprietor.

Among the patents just granted to New Englanders is one to A. A. Noyes and A. A. Clement, of Boston, for the manufacture of "paramidophenol sulphonic acid."

Two Maine druggists, W. H. Stewart, of Lewiston, and J. S. Towne, of Brunswick, have just bought soda fountains of the Low Company, in anticipation of the summer trade.

Among the victims of some swindlers named Bellah, who were recently arrested in Woburn, is Arthur Whitchee, a druggist in that city, who trusted them to the extent of \$25.

Mr. Crowell, of Winchester, who is well known in connection with the manufacture of "Bovox," has lost his father, Capt. Rufus Crowell, one of the prominent citizens of Chelsea.

Ernest Wadewitz, of New Haven, Conn., has lately moved, and his new drug store is very tastefully fitted up. Mr. Wadewitz bought two soda fountains from the Low Company.

At the Beyercroft Pharmacy, in Cambridge, ordinary prescription have lately been filled for the poor without charge, the physician's certificate of the patients' inability to pay being sufficient.

C. A. Baker, of Fall River, one of the oldest druggists in the state, was a heavy sufferer by a large fire a short time ago. He is, however, still doing business, though laboring under disadvantages.

Mrs. Horace Goodwin, of this city, has invented a spoon which will make it pleasant for invalids to take medicine. The spoon carries a hinged lid, which prevents the escape of unpleasant odors, and likewise the spilling of the medicine.

Hon. Gorham D. Gilman, of Gilman Bros., is receiving many social honors. He has lately been the guest of the New England Furniture Exchange at its annual banquet and addressed the Art Club on the subject of "Hawaii, Past and Present."

Already promoters of the plan to have a free training school for plumbers in this city have obtained \$1,700, owing, largely, to the efforts of James W. Tufts. Mr. Tufts put in \$100 and his partner, James N. North, duplicated the generous contribution.

According to the returns filed at the State House, the Talbot Dyewood & Chemical Co. has as assets, real estate, \$6,500; machinery, \$21,400; cash, \$24,182; stock, \$30,434; miscellaneous, \$2,535. Liabilities, capital, \$60,000; debts, \$9,141; net income for the year, \$4,530.

Burglars entered the drug store of John H. Sullivan, Gore street, Cambridge, about a fortnight ago, by breaking the glass in the front door and then turning the key by thrusting a hand through the opening. About \$10 was stolen, besides some cigarettes. The thieves probably were boys.

J. D. Tyler, druggist, Windsor Locks, Conn., took a dose of belladonna to relieve pain. He soon discovered that he had taken an overdose, and treated himself with antidotes. Early the next morning he went into a stupor, and several physicians were summoned. They were unable to arouse him, and later he died.

As there has been considerable talk here about an epidemic of grip this winter many physicians and others have been interviewed on the subject. Among those who gave their views on various phases of the question is E. W. Taff, representing B. W. Neil & Co., wholesale druggists, who said: "I do not believe we shall have it to any extent this year. We do not expect an epidemic and are not getting in any extra stock of remedies."

Robert S. Joy and Isaac Jacobs, self-confessed counterfeiters, have been arrested for using counterfeited labels and form of advertising, and also using counterfeit trademarks. Jacobs is a cigar-maker by trade, and it is alleged that he and Joy have been counterfeiting the brand of "J. A." cigars, manufactured by Alles & Fisher, of Cambridge street. The men admit their guilt and the plates by which boxes and trademarks were stamped have been recovered by the police.

The first convictions under the statute of 1885 forbidding the sale and use of opium for smoking have been secured in the municipal criminal court. Judge Burke has fined four Harrison avenue Chinamen \$250 each. They were arrested for maintaining a room where opium was sold. These habitations of vice were raided by policemen, and several opium outfits were seized. Five fines, aggregating \$100, were also imposed upon a like number of individuals for resorting to "opium joints" on Harrison avenue.

Apparatus for hot soda has lately been supplied by the Low Company to J. H. Lakin & Co., Boston; G. K. Mountain, East Boston; Frank Tucker, Tremont street, Roxbury; C. J. O'Shea, Salem; Bernard Billings, Newton Upper Falls; W. S. Tower, Melrose Highlands; Bates & Kirby, New Bedford; James O'Hare, Providence; Thomas & Co., and C. S. Balley, New York City; C. F. Gibbon, Washington; all of whom are druggists. W. D. Grace, Portsmouth, N. H., has ordered both hot and cold apparatus of the Low Company.

Charles R. Kirby, a drug clerk in Worcester, was in court the other day to answer to a complaint for being a fugitive from justice. Constable Nickerson, of Vineland, N. J., testified that Kirby was one of three members of the excise commission for Cumberland Co., N. J. This commission had power to grant liquor licenses. The people of Vineland were particularly averse to liquor selling, and when the Supreme Court recently declared the liquor dealers brought suits against its members for extortion. Their efforts met with success, and in the case of the Cumberland County commission they secured an indictment for extortion. The other two members of the commission had been arrested in New Jersey prior to Kirby's arrest. The judge here said he did not think Kirby was a fugitive, and that, if the New Jersey authorities want him, the thing to do is to get out requisition papers and then come after him. The court ordered Kirby to be discharged.

PHILADELPHIA.

The Dana Sarsaparilla Co. has published the first series of its prize lessons in penmanship for boys and girls. The book is intended for residents of Maine, New Hampshire and Massachusetts under 15 years of age. It closely resembles the copy-books used in schools, such as those of the Spencerian and other systems. Four prizes are offered, amounting to \$100, the first being \$50, and the others \$25, \$15 and \$10 respectively. The only conditions are that the work shall be done with black ink and without assistance, and the books mailed to the company at Belfast, Me., by May 1, 1894. Rev. A. E. Winship, editor of the Journal of Education, Boston, will act as judge.

There entered the drug store of S. J. Clark, in Attleborough, about ten days ago, an old man who said he wanted some alcohol. Herbert Mason, the clerk in charge, refused to sell it without a prescription; but, as the visitor pretended to be an umbrella repairer, and said he wanted the liquid solely for cleaning the ribs of the umbrellas, and asked to be favored because he was an ex-soldier, Mason was persuaded to make the sale. Into the alcohol he put some tincture of aconite. Upon the pint bottle he put two labels, one "For external use only," the other, "Poison." Over and over again he cautioned the buyer not to swallow any of the stuff, telling him that it would cause death. Now, when the stranger went out he met six other tramps who were waiting for him, and they concluded to risk taking a drink. Two of the strollers were killed and all the rest escaped only by a slim margin. It was a horrible experience for young Mason, though nobody doubts that he used great care in giving his warning.

School Committeeman Henry D. Huggan had in his handsome drug store on Maverick Square, East Boston, on New Year's day, two customers who made the most desperate effort to wreck and ruin it. They smashed the show cases, the plate glass in the door, and did altogether many hundreds of dollars' worth of damage. These troublesome visitors were Samuel McSheehy, aged 27 years, proprietor of a drug store in another part of East Boston, and William Sullivan, aged 23 years, a substitute letter carrier. They both appeared to be intoxicated. While being served with soda, one of them addressed some insulting remarks to a lady customer present, which brought a protest from Mr. Huggan. They would not desist, and upon Mr. Huggan's sending one of his clerks for a policeman, McSheehy picked up the glass from which he had been drinking, and threw it at the school committeeman's head. Then the destruction began. Glasses were thrown here, there and everywhere. After the glasses there followed the flavor bottles. They crashed into the beautiful show cases, not alone breaking the glass, but damaging the thousand and one articles that apothecaries delight to show for the admiration of their customers—toilet sets, and the like. Glasses struck in among the bottles adorning the shelves, and also shattered the plate glass of the door. Mr. Huggan kept dodging the missiles. The lady customer had fled to the street. The lady customer, also, sought safety in flight. The men for a few minutes had the store practically to themselves; but the clerk found a policeman in a few moments and the vandals were arrested.

Philadelphia, January 11.—Many of the drug houses in this city are busy taking account of stock, and until that is completed there will be very little attention given to improving their business. In general trade circles there is somewhat of an improvement, especially in the demand for quinine. It is said that there is very little of this drug in second hands, and that there is a possibility of the price being advanced. The importers hold the key to the situation, and if they desire to mark the price up there is nothing to prevent them, as they have nearly all the visible supply of the drug.

The last two weeks of the old year were good ones for the drug trade, and the business done during that time had considerable to do with the improvement in the year's business. For several months the wholesale and retail druggists have been doing very little business, and at one time it seemed that all of them would run far behind in their business, as compared with 1892. While to some extent there has been a falling off, it is not as large as it was thought it would be, as the business done in the latter part of December was very large and helped to bring up the receipts. The new year started out very well, taking everything into consideration. Most of the large wholesale houses have plenty of orders, and there is no apparent lessening of them. In druggists' sundries there is not much being done, as is generally the case just after the holidays, but, notwithstanding this, some of the manufacturers are getting their goods ready, and in a short time will start their men out on the road. Considerable attention is to be given to the southern trade this year, and old conservative Philadelphia is going to make a big bid for the drug business of that section of the country.

The retail druggists are doing a good prescription trade, and for once they are not complaining of the manner in which some houses are selling patent medicines. While patent medicines are cut by a number of drug stores, there is not much of a reduction in prescriptions. The prices are fairly well maintained, and, as a rule, the druggists who make a cut in the price of patent medicines are the ones who generally uphold the price of prescriptions.

Considerable excitement was created in drug circles during the last week in December by Keesbey & Mattison Company, manufacturers of chemicals and pipe coverings at Ambler, a little town about twelve miles out of Philadelphia. All the excitement was caused by the posting up in the works of the company the following circular:

"Notice to our employes: The preparation and introduction of the Wilson bill in congress, having for its object the lowering of the tariff, has caused this company to lose a large amount of business among the textile and other milling interests, lessened our demand for labor, and is daily depriving the stockholders of the company of the ordinary profits of a manufacturing business. Therefore, those of our employes who are in sympathy with this measure are requested to hand in their resignation to the superintendent, as it is only fair to their fellow-employes that, as their work grows less, it should be done by the men who are not responsible for the present deplorable condition of economic affairs. With the passage of the Wilson bill wages will be reduced, and there will be less work at the reduced wages, it being to do only by the greatest exertions and sacrifices upon the part of the officials

and stockholders of the company that the machinery and covering departments of these works are at present running, instead of being closed for the winter, as are so many mills in our vicinity."

This circular was signed as follows: "Keesbey & Mattison Co., Richard V. Mattison, M. D., President and General Manager." In speaking of the circular Dr. Mattison is reported to have said that in employing new men preference would be given to Republicans, as they should not be made to suffer for the present depression, while Democrats, who were directly responsible for it, should be made to feel it in preference to Republicans. This circular caused considerable discussion in trade circles, and in the mining districts a meeting was held, and several doctors are said to have taken the stand that they will not use any of the articles manufactured by this firm. The Philadelphia Times, in an editorial, jumps on the firm, and in response to the editorial the following letter was sent to the Times:

"I notice in your editorial columns today that you have taken considerable space to refer to our company, and a foot note states that 'the company is discharging all of its Democratic employes.' Now, it is one thing to state opinions and it is quite another thing to state facts, and I do not think it correct for you to state things as facts which have not occurred.

"Of the employes dismissed on account of the depressed condition of things industrial, all were Republicans except three, who were Democrats, and two of these Democrats were re-employed by our company some two weeks ago.

"It does not strike me that this action looks very much like a threat to work up high tariff majorities in manufacturing districts. Does it? No person has ever been discharged by our company on account of his religious, political or economic opinions.

Respectfully,
"RICHARD V. MATTISON, M. D.,
"President Keesbey & Mattison Co."

A committee was appointed last month consisting of Messrs. Sturgis Coffin, Alfred G. Wright, Theo. Ricksecker and Henry Dalley, Jr., to get up a petition to protest against the new tariff bill, which so seriously affects the perfumery business. A meeting of about twenty-five firms representing the leading manufacturers was held in New York on December 20. The sense of the meeting was that the duties now prevailing on imported perfumery should at least remain the same. This committee has issued a circular to the trade, in which it says:

"It is important that the committee should have your support, and we urge upon you immediate action. You should immediately communicate, personally and by letter, with your representative in congress, urging upon them the necessity of our case, and that these dealings now prevailing should be maintained. You have already doubtless been informed that a stamp tax on our goods is contemplated and has a very strong backing in congress. To those who will recall the difficulties and expenses attending the imposition of this tax as a war measure, it will not be necessary to show how onerous a burden such a tax will be. We therefore urge you to take prompt action in expressing to your representative in congress our objection to the imposition of this stamp tax."

The trade at large have authorized the committee to spend such sums of money as shall seem necessary in furthering these ends, and have decided that a contribution of \$100 from each of the perfumery manufacturers will probably defray all the necessary expenses.

The first change to be reported this year is that in the well known drug store at Fifteenth and Market streets, which occurred on January 2. Several years ago Amos Garnall & Co. conducted a wholesale and retail business at this stand, and were afterwards succeeded by Edward C. Jones & Co. Everyone in the city knows and respects Edward C. Jones, and nearly all are familiar with the cause of his retirement. To those who are not it may be said that Mr. Jones' kindness and generosity and constant desire to help others got the better of his judgment and led him into extending credit to many who proved unworthy of his confidence. The store then passed into the hands of W. H. Earl & Co., who found it a task more difficult than they expected to build up a business that for years had been losing ground. Two years ago Mr. Earl closed the wholesale department, and has since devoted his attention to the retail trade. Early in December he concluded to retire from business, and, consulting Frank E. Engelman, placed the store in his hands for sale. A. Eugene De Reeves, the purchaser, during the past three years has visited every drug store of prominence in the United States, and his natural astuteness and large experience led him in a moment to perceive the advantages of this location, and he hastened to close the bargain. The store is immediately opposite the Market street exit of the new Pennsylvania depot, and is unquestionably more favorably situated than any other pharmacy in the neighborhood to catch transient trade from the numerous passengers on this road. Mr. De Reeves is a graduate of the Philadelphia College of Pharmacy, and was formerly with J. T. White, at Twenty-first and Pine streets; afterwards with Milton Campbell, Mr. White's successor. He was next employed by the H. K. Mulford Co. as salesman, and for the past three years has traveled in the interests of the Trommer Malt Co.

After having enjoyed a vacation of ten days, the students of the Philadelphia College of Pharmacy resumed their work on the evening of January 3. Many of the boys did not leave the city. Instead of taking a rest they took advantage of the holidays to do some hard studying, and, in consequence, are now in excellent mental trim for the approaching examinations. The laboratories were crowded at this break in the lecture courses, and both junior and senior students advanced themselves in their work. Then, too, those who came to the college from far-off western and southern cities did not have time to become homesick.

The Board of Trustees of the College have decided to offer another annual scholarship. It is to be in memory of the late Prof. John M. Maisch. One thousand dollars has been set aside for this purpose, and its interest will be available for the purchase of lecture tickets. It is considered to be especially fitting to name a scholarship after Prof. Maisch. He was always the friend of the man who was handicapped with poverty or limited resources, and many of the alumni will acknowledge what he has done toward helping them, though it was not shouted from the house-tops. There are now four scholarships of \$1,000 each offered by the college—those in honor of Robert Bridges, Edward C. Jones, Peter Williamson and John M. Maisch. The income annually is

about enough for the tuition fees of six students.

Even the gentle, art-loving Japanese become bilious. That is to be inferred, at least, when the handsome specimen of camolom added to the college museum by Prof. Trimble is seen. He received it from the Japanese commissioner to the Columbian Exposition last week, together with a neat pamphlet on its therapeutic properties and the process of manufacture. American pharmacists, not having seen Japanese camolom before, would not recognize the foreign product. Its physical appearance is vastly different, and also superior from a point of beauty to the heavy impalpable powder of home manufacture. It comes in glistening pure white scales, which are remarkably light in weight and very bulky. The commissioner writes that one family has made this camolom for over 300 years in a village near Tokio. The annual product is said to be 15,000 pounds. In the Japanese language camolom is known as Keifun. The chemists making it pride themselves on its absolute freedom from mercuric chloride.

The Zeta Phi Society of the senior class has admitted Miss Florence Yaple and Miss Emma L. Kaye as honorary members, and presented them with handsome pins. A glee club and quartet have been organized in the college with C. L. Weidner, W. E. Bowen, F. H. Blackmer, B. La Rue Lauterman, Abner Webb, H. M. Wasley, H. G. Miller, F. W. H. Schearer, O. W. Sellers, H. S. Tompkinson, H. E. Weber, Richard Reeser, H. F. Howell, F. M. Hatten, D. A. Loser, W. L. Light, W. C. Aughinbaugh, F. Rhein, C. L. Fluck, U. G. Hendee, G. F. Baker, R. M. Kaufman, W. G. Barlow.

Walter F. Ware, manufacturer of "Mizpah" specialties, has removed his establishment to 512 Arch street.

The firm of Finnerty, McClure & Co. has been dissolved, Mr. Finnerty retiring. The business will now be carried on under the name of McClure, Heritage & Co. at the same place.

Schandin & Lind, manufacturers of Garwood's standard perfumes, have opened a branch office under the direction of Robert Fergusson at 51 Mercer street, New York.

Philadelphia has taken up the atomizer fad, which a year ago appeared above the commercial horizon. The styles and prices have varied considerably. An increase in the perfumery trade has been a natural result.

W. J. Lerch, the representative of Colgate's perfumery and soap, with headquarters in Cincinnati, spent New Year's week in this city with his friends, Mr. and Mrs. MacLaren, on North Fifteenth street.

By the failure of Fleischman & Co., at Pittsburg, dealers in dry goods and fancy articles, a number of the wholesale drug houses in this city were stuck, especially those who had supplied that firm with perfumery.

John C. Rogers, lately salesman for Schandin & Lind, has started into business for himself. He has associated himself with Mr. Chapman, and the new firm will be known as Chapman & Rogers, dealers in perfumery.

George D. Feicht & Co., 604 Arch street, report a large sale in their 3 F Cough Drops. This firm has also on sale a large line of W. H. Brown Bros.' perfumes.

They also handle Gilpin, Langdon & Co.'s powdered drugs and the pharmaceutical preparations of Sharp & Dohme.

William J. Pechin, the enterprising druggist of the northwestern section, reports a good Christmas business. Mr. Pechin has just made a contract with Charles Lippincott & Co. for a large soda fountain. It will be a unique as well as handsome ornament, and will occupy the greater part of the Twentieth street side of the store at Twentieth street and Columbia avenue.

George M. Smith, who for many years has traveled the country over as a salesman for John M. Maris' Sons, but who took it in his head last year to remain in the office of the firm, has again changed his mind and started on another tour. It is thought by Mr. Smith's friends that he is on his way to Florida to challenge the winner of the Corbett-Mitchell fight. Mr. Smith is a great sportsman, and for the last four months he has been in active training. He is, as the sporting fraternity put it, "fit to make the fight of his life."

A dinner was tendered to Robert S. Lucas on Wednesday evening, December 20, by his fellow-employees of the cashier's department of the firm of John Lucas & Co., paint and glass manufacturers, 322 Race street. Mr. Lucas is soon to leave this city to assume duties in the branch office of the firm in Chicago. An enjoyable evening was spent, and Mr. Potter, head of the department, on behalf of those present, spoke in glowing terms of the pleasant relations existing between employer and employes, and wished the guest of the evening godspeed and success in his new field of labor. Mr. Lucas felicitously thanked the company for the honor done him, and hoped next year to be at the festive board again with the boys. There were present Messrs. Potter, Haulterman, Bryan, Lorcey, Heiser, Queen and Simpson.

On the evening of December 25 a fire broke out in the building 123 North Seventh street, occupied by Wiley & Wallace Co., dealers in drugs and chemicals, and before it could be extinguished about \$500 damage was done. The fire was discovered by policemen about 7:45 p. m. They burst in the door and found flames in some hay and rubbish near the center of the store, close to the elevator. With some assistance the policemen stamped the fire out, but by the time the firemen had arrived and were getting their hose out a fire broke out on the third floor in another quantity of rubbish. The fires on the first and third floors appeared to be independent of each other, but before that on the third floor had been extinguished the flames had crept up the elevator to the fourth floor. The firm was about to move to a new building, and the store was for rent. On November 11, 1889, there was an explosion of flash powder in the basement of this store, instantly killing Joseph Wiley, the senior member of the firm, and two employes. Five persons were injured and nearly every pane of glass in the building was broken.

A new olive mill has been put in operation in Montecito, Cal., which as an industry promises great things. The machinery is of the best type and the product is a superior grade of oil. The largest sale of olives by any individual rancher to the company is recorded at sixteen tons, while another has delivered eight tons.

DETROIT.

The duties of the proprietor of a drug store are manifold and the man who, in these latter days, can successfully operate a pharmacy must have all of the qualities of a Figaro. In addition to the duties which he now performs he may be called upon to assume others if the recommendation of the president of the public library commission becomes operative. That official recommends that there be established eight library stations in this city where patrons of the city library may go and leave requests for the books they want. He believes also that druggists would be glad to do this work for a nominal compensation. Each day the eight sub-libraries would get from the public libraries the books that had been requested the day before, and keep them in readiness for those ordering them. In way of remuneration the sub-librarians should receive \$2 for each 100 books handled up to the point of \$20 a month, and then only \$1 a hundred. The president of the commission thinks the plan would greatly increase the circulation of the books. Whether the druggist will direct his efforts toward establishing the scheme or not is a question. Many druggists believe they have enough to do now.

The Michigan Board of Pharmacy met at Saginaw January 10.

L. T. Lochner, druggist at Adrian, has organized a stock company to manufacture a new proprietary remedy.

Mr. Percy Latham, with Billings, Clapp & Co., manufacturing chemists, Boston, Mass., has been visiting the drug trade in this city.

E. C. Kinsell, druggist, 752 Michigan avenue, will remove his stock to the store recently made vacant by the removal of S. F. Fritzele to 4 and 6 Grant street.

E. R. Wilson, for many years one of Grand Rapids' well-known druggists, died recently. He was 64 years of age, a prominent Mason, and a member of the Old Settlers' Association.

Brown's Pharmacy recently suffered a small loss by fire. A machine in the basement employed by an outside party for roasting peanuts, was the cause of the trouble. Damages very slight.

John G. Wise, Ph. G., '85, Chicago College of Pharmacy and for a number of years a retail druggist in Chicago and later in Indiana, is now with the Detroit Standard Savings & Loan Association.

John Fahry and Anthony Drach, partners in the drug business at Benton Harbor, have been arrested for quarreling and drawing pistols. Chicago wholesalers have taken charge of their store, which will probably be closed.

Miner E. Keyes, a graduate of the Philadelphia College of Pharmacy, has leased the premises corner East Fort street and Campau avenue for a drug store. Farrand, Williams & Clark are furnishing the entire stock and fixtures.

The "free remedy" dealers operating from Marshall have been denied the use of the mails, the postmaster of that city having been ordered to withhold the mail of all local firms or individuals advertising to send free remedies to the suffering. The postoffice inspector has decided that the business is illegal. At least twelve firms were engaged in the business.

Farrand, Williams & Clark are remodeling and thoroughly overhauling the premises recently occupied by Williams, Davis, Brooks & Co. With new fixtures, convenient location and increased facilities for transacting business they will not only benefit themselves but their customers as well. They expect to move at an early day.

M. S. Goodman, secretary and treasurer of the Hazeltine-Perkins Drug Company, Grand Rapids, has resigned from that position and will engage in other business. He is succeeded in the drug business and in the two offices, by M. B. Hazeltine, son of Dr. C. S. Hazeltine, president and principal stockholder of the corporation.

W. J. Crane, who has represented Lord, Owen & Co., wholesale druggists, Chicago, in the Upper Peninsula for a number of years, has resigned his place with that concern and taken a similar position with Fuller, Fuller & Co., also of Chicago. His territory will embrace Northern Wisconsin and Northern Michigan. Nequawbe will be his headquarters.

Dr. Kedzie, state analyst, has recently been examining various food products now on the market. A sample of coffee was found by him to contain 12 per cent coffee, 20 per cent of wheat or barley and 68 per cent of peas or beans. A sample of coffee extract was found to consist of a mixture of roasted chicory and peas, with sufficient glucose to make it into a solid roll. Jellies and maple syrups were found quite generally adulterated.

QUINCY, ILL.

Miller & Arthur report a good holiday trade.

Percy Brown, of Chicago, is the prescription clerk at Christie's Pharmacy.

The City Hall Pharmacy, until recently owned by Christie & Granacher, now belongs to ex-Mayor Walker.

Dr. J. Y. Lewis, of the Central Pharmacy, reports a good holiday business. He has a fine store and enjoys a good business.

The Quincy Retail Druggists' Association will hold their annual meeting in February. H. Schroeder is president and Frank C. Parker secretary.

Mr. Schanz, secretary of Sommer, Lynds & Co., wholesale druggists, has been soliciting signatures from the drug trade to a petition memorializing Congress against a reinforcement of the stamp duty on proprietary articles. A majority of our druggists signed it.

A newspaper man at Omaha, Neb., brings to light a few of the disadvantages under which the druggists of that state labor in the matter of liquor selling. The law requires each applicant for license to sell liquor either as a beverage or for medicinal purposes, to publish a notice of such application for two weeks in the newspaper having the largest circulation in the county. The rate for such publication is fixed by law, so that the cost of such notice foots up \$13, to which must be added a fee to a notary for certification, which makes the total amount \$13.25. As one newspaper is disposed to cut rates and do the advertising for \$3.25, its chief competitor demands an investigation of circulation claims, and threatens to protest every application which is found to have been published in a paper not having the largest circulation.

THE HINCHMAN FIRE.

Wednesday evening, January 3, shortly after 6 o'clock, a fire was discovered on the third floor of the wholesale drug establishment of T. H. Hinchman & Sons, located at 76-78 Jefferson avenue, Detroit, Mich. The flames spread very rapidly, and almost before the fire department arrived the entire building was in flames. Most of the employees had left, and the few remaining ones barely had time to escape, after locking the vaults and safes and taking such books and other valuables as they could carry in their arms. The fire raged for about two hours and destroyed all the stock, with the exception of some heavy goods stored in the cellar, and what was locked in the vaults. The inside of the building was completely destroyed, leaving only the walls.

The cause of the fire is as yet a mystery. The loss on stock is something over \$109,000, with an insurance of \$63,000. The loss on the building is estimated at \$35,000, with an insurance of \$20,000.

Early the next morning the firm had rented temporary quarters at 31 East Larned street, put out their sign and were ready for business. They telegraphed their agents to stay out on the road, and through the kindly assistance of their neighbors they have been able to take very good care of their orders. Fortunately, the stock had been reduced as much as possible for inventory purposes, and goods which had been ordered for the new year had not yet arrived. Larger quarters will soon be secured, and with an entire new stock of goods, purchased at a most favorable time, the firm expect to soon be re-established, with their trade on a much larger scale than ever before.

The firm will lose thousands of dollars over and above their insurance, and "about the only consolation," said a member of the firm, "has been the large number of telegrams and letters which we have received from our friends in the trade, expressing their sympathy and offering their assistance. Many of our customers throughout the state telegraphed or wrote to this effect, and said they would buy as light as possible until we were able to take care of their full orders."

We print below a few of the telegrams and letters received from jobbers and manufacturers, showing the high esteem in which Messrs. Hinchman & Sons are held by these influential members of the trade:

(TELEGRAMS.)

Toledo, January 4.

Regret to learn of your loss. We offer our services.

WALDING, KINXAN & MARVIN.

Pittsburgh, January 4.

We learn with deep regret of your misfortune.

GEORGE A. KELLY CO.

Cleveland, January 4.

You have our sincere sympathy. Command us in any way that will be of service.

STRONG, COBB & CO.

Cleveland, January 4.

We wish to extend to you our sympathy, and will be pleased to render you any assistance in furnishing you goods or filling your orders for you.

BENTON, MYERS & CO.

New York, January 4.

Grieved to learn of your affliction. Command us freely.

MERCK & CO.

Philadelphia, January 4.

Receive heartiest sympathy. Can we serve you in any way?

JOHN WYETH & BRO.

St. Louis, January 4.

Regret to learn of your loss by fire. If we can be of any service, please command us.

MALLINCKRODT CHEMICAL WKS.

(LETTERS.)

Grand Rapids, January 4.

Gentlemen—It is with great regret we learn by press dispatches of the total loss of your stock by fire last evening.

If there is anything we can do for you in the way of making shipments until you can get another stock together, we will be very much pleased to do so.

If, in any other way, we can assist you, please call on us, as of all the competitors we have in our line, we have the warmest of feelings for you.

Very truly yours,

HAZELTINE & PERKINS DRUG CO.

Chicago, January 4.

Gentlemen—We notice by this morning's papers that you have been visited by the fire fiend. As we have had varied and repeated experiences in this line, we feel that we know how to sympathize with you in such a calamity. Allow us to most sincerely commiserate with you in this misfortune and interruption of your business. If we can serve you in any way, it would be our pleasure to do so.

Truly yours,

LORD, OWEN & CO.

Chicago, January 4, 1894.

Gentlemen—We learn by the morning papers with deepest regret of the misfortune which has befallen you by destructive fire. We hasten to express our regrets and that the distance lessens any prospect on our part showing our substantial sympathy.

Hoping your insurance will turn out well placed, and soon to hear of your early re-establishment, we remain

Very truly yours,

PETER VAN SCHAACK & SONS.

St. Paul, January 4, 1894.

Gentlemen—We notice with extreme regret the account of your fire, and trust sincerely that the loss is well covered by insurance, and that you will soon again be doing business in a larger and finer store, and with increasing prosperity.

It is a sad beginning for the new year, but we venture still to hope that the new year will be a happy and prosperous one for you in spite of this disaster.

Yours respectfully,

NOYES BROS. & CUTLER.

Louisville, January 4, 1894.

Gentlemen—We regret sincerely to see in the morning paper the announcement of your misfortune in the loss of your stock by fire.

From a similar experience some years since, we can fully appreciate your unfortunate position.

We feel sure that you are well protected by insurance, but this is no compensation for the loss of business, and great labor involved in such troubles. We hope that we may in due time, indeed at an early day, hear of your resumption.

Very truly yours,

ROBINSON-PETTIT CO.

Louisville, January 4, 1894.

Gentlemen—We notice with regret in the morning paper a statement of your disas-

trous fire. Having passed through just such an experience we write to tender our sympathy, and if there is anything in our power that would aid you in repairing the loss, we would be happy to render any such assistance as we can. With the hope that you will soon resume business and without material loss in the matter, we remain,

Your friends,

ARTHUR PETER & CO.

St. Louis, January 4, 1894.

Gentlemen—We regret to learn, through the daily papers, that you have had the misfortune of having a serious fire in your establishment, and beg to offer you our sympathy, and trust that your loss will not be very large, and that your interruption in business will be short. The papers say it started in your packing-room. Do you know how it originated?

Very truly yours,

MEYER BROS.' DRUG CO.

Kansas City, January 4, 1894.

Gentlemen—I was much pained to read in this morning's paper that your house and stock of goods had been destroyed by fire. From personal experience I know what this means, and I beg to extend to you my sincere sympathy. I hope the adjustment of your insurance claims will be satisfactory, and that you will soon be in shape for business. May the new year which opens so inauspiciously bring you much good in the end.

Yours very truly,

FRANK A. FAXON.

Philadelphia, January 4, 1894.

Gentlemen—We regret to learn from the newspapers this morning that your establishment has been visited by a serious fire. We beg to tender you our sympathy, and if we can be of any service whatever to you, shall esteem it a favor if you will kindly advise us.

Yours truly,

POWERS & WEIGHTMAN.

St. Louis, January 4, 1894.

Gentlemen—We regret very much to notice in to-day's paper that your store has been burnt out, and we beg to tender you our sincere sympathy. We hope you will soon be in a position to resume your business, and remain

Yours truly,

HERF & FRERICHS CHEMICAL CO.

Cleveland, January 4.

Gentlemen—We regret to note through the columns of the morning paper that you have met with a severe loss by fire. We hope that you are fully insured and that you will soon be in a position to resume business again. You are one of the oldest customers we have on our books, and our business relations have always been of the most pleasant character. We wish to extend to you our sympathy, and if we can be of any assistance to you or accommodate you in any way, please advise us.

Your friends,

THE GRASSELLI CHEMICAL CO.

New York, January 4.

Gentlemen—In the New York papers you are reported as having quite a disastrous fire.

We exceedingly regret to learn of your misfortune, but trust it is not as serious as reported.

Our December account can now wait your pleasure, and we regret not to be able to offer you a more substantial help.

Trusting you will soon be out of chaos, we wish for you a prosperous year.

Yours truly,

CROTON CHEMICAL CO.

Detroit, January 3.

Gentlemen—We greatly sympathize with you in your fire loss and great interruption to your business. If we can be of any service to you in any way, do not hesitate to call upon us.

Yours truly,

THEO. H. EATON & SON.

Detroit, January 4.

Gentlemen—We tried hard last evening and this morning to get at you people personally by 'phone and otherwise, but have been unable to do so. We wish to tender you our sincere sympathy, and if we can in any way serve you, do not hesitate to call upon us. We will be glad to serve you in any way through the medium of our establishment, to assist you in filling your orders, or in helping you out until your stock arrives.

The writer, as you are aware, has been very unfortunate in the way of fires, and can fully appreciate the unfortunate position which you are in this morning, and if our firm, in any way, can serve you, do not hesitate to call upon us. We will do everything in our power to facilitate your early re-establishment, and hope you will not hesitate for a moment to use us as you may see fit. With our sincere regrets, and hoping that the loss will not be as great as the papers have put it this morning, we remain,

Yours very sincerely,

WILLIAMS, DAVIS, BROOKS & CO.

Detroit, January 4.

Gentlemen—We sincerely regret to learn of the serious fire which occurred yesterday, and know from experience what setbacks a business house is subjected to under such circumstances. We trust that if we can be of assistance to you in any way that you will not fail to call upon us.

Again assuring you of our sincere regret for your misfortune and with kindest regards, we beg to remain,

Very truly yours,

F. STEARNS & CO.

Detroit, January 4.

Gentlemen—It is with very much regret that we feel called upon to extend to you our sympathy with regard to the loss and serious inconvenience you have suffered from last evening's disastrous fire. We feel that we are in position to keenly appreciate the situation from your point of view, although our mishaps of like character have never resulted in so complete destruction as yours in this instance. We trust that you will speedily resume with, if anything, improved facilities for the conduct of your business, and if we can in any wise assist you in the premises, we shall be only too glad to have you call on us for such assistance. Meanwhile we beg to remain

Sincerely yours,

ACME WHITE LEAD & COLOR WKS.

Detroit, January 4.

Gentlemen—We were unable to find any member of your firm while your fire was in progress last night, and only able to reach you by telephone quite late in the evening. We then expressed to you our sincere sympathy and offer of any assistance in our power, and will see you this morning and personally extend to you any help we can render you. We trust that after your insurance is adjusted you will find that you have not suffered loss.

Very truly yours,

FARRAND, WILLIAMS & CLARK.

CHICAGO.

Chicago, January 11—A review of trade for 1893 discloses a more pleasing condition than some had anticipated. The wholesale houses report that the total of trade for the year was in advance of the twelve months preceding. Up to June trade was exceptionally favorable prices being well maintained, but when the financial depression began to affect the whole country prices weakened and purchases fell off. Some little reaction for the better was felt in September, as stocks had been allowed to run so low that retailers found it absolutely necessary to replenish them. The holiday trade, particularly in sundries, was not so good as could be desired, but all things considered the drug trade has cause to congratulate itself on passing through the great financial depression of 1893 with so little injury. Jobbers, while granting all legitimate accommodation to their customers, have been guided by a policy of careful discrimination, and the effect has been the maintenance of a stable condition. Collections have been fairly good, better than could be expected under the circumstances. The new year starts out with every promise for an increase in profitable business. Medicines and drugs are less affected by hard times than the great majority of commodities. They are necessities, and the average man can always find means to procure medicines for his ailments.

The Amos and Swinford Co. will on a capital stock of \$2,000 manufacture and sell perfumes, complexion powders, etc.

The Ash Soda Fountain Co. is a new Chicago concern with a capital of \$25,000 contributed by Iluco Ash, Robert McMurdy and Fred W. Job.

The D. & L. Caledonia Spring Water Company, with a capital stock of \$50,000, has been incorporated in this city by John H. Doran, H. L. Langelier and J. J. McClellan.

The Mrs. Dr. Truenell Medical Manufacturing Company has been incorporated with a capital stock of \$50,000. Stockholders are Estelle Truenell, Lily Vanarsdale and Pearl Young.

Druggist D. B. Miller, of Glencoe, was arrested December 22 charged with selling liquor without a license and was released under \$200 bonds for later hearing. It is said that several other arrests of a similar nature will be made in the towns along the north shore.

Morrisson, Plummer & Co. now occupy the space heretofore held by Gerts, Lumbard & Co. under a sub-lease which has just expired. They are therefore given increased floor room, and claim to have the largest drug building, so far as square feet of floor space is concerned, in the city.

George Wagner, Jr., Ph. C., was recently appointed instructor in botany and pharmacognosy in the School of Pharmacy of Northwestern University and entered upon his duties December 18. He is a graduate of the class of '93, School of Pharmacy, Michigan University, at Ann Arbor.

James D. Sipp, a Riverside druggist, had for some time noticed a great falling off in his receipts and at last became suspicious of his clerk, in whom up to that time he had reposed the greatest confidence. A little detective work with

the use of marked bills resulted in trapping the clerk, G. E. Bluo, who confessed to having stolen \$90 in small amounts; \$450 was recovered.

Traces of the fire at 110 Randolph street are rapidly disappearing, and in a week or two things will be moving on as though nothing had happened. The Jno. Block Drug Co. were the chief sufferers, and the only occupants damaged by the fire itself. E. H. Bushler's stock of Schiefelin's pills and Fairchild's preparations was affected by smoke only, no damage being done that new wrappers will not repair. The Era's Chicago office is in the same room, but aside from a slight scorching of its desk, it sustained no loss.

On New Year's eve the Kent Chemical Laboratory was formally presented to the trustees of the University of Chicago. The dedicatory exercises were held in the auditorium of the laboratory, and were the principal event of the winter convocation, and, with possibly a few exceptions, the chief event in the history of the institution. All of the exercises of the evening were in keeping and sympathy with the dedication on the bronze tablet, which the donor, Sidney A. Kent, caused to be placed in the walls of the main hallway: "This building is dedicated to a fundamental science in the hope that it will be a foundation stone laid broad and deep for the temple of knowledge in which as we live we have life."

The principal address was delivered by President Harper. Many noted chemists were present at the convocation, among whom were: Profs. Remsen, Prescott, Baker, Russel, Smith, Long, Hillyer, Paul C. Freer. The total cost of the building, including furnishings, equipment, etc., was \$235,000.

Arthur A. Winter, a traveling salesman and former druggist, is in trouble. Some years ago he and James T. Dougherty owned a drug store in McCoy's Hotel. Dougherty sold out to Winter, accepting in payment five promissory notes of \$500 each. An expert, called in by Winter to examine the books, said Dougherty had secured more than his legal share of the business in the transfer. Winter's attorneys thereupon caused Dougherty's arrest after he had refused to restore the notes. Then Dougherty's attorneys sued Winter for \$50,000 on the ground of forcible detention, and, it is said, secured a judgment of \$750. When the writ of execution was served upon him by the deputy sheriff, he was engaged in making preparations for his marriage upon the following day. He refused to honor the writ of execution, and the next day the officer called again with a capias and arrested him. His fiancée refused to leave him and went with him to the sheriff's office and remained with him until he was arraigned in the county court. The father and mother of the young lady furnished \$2,000 bail, and Winter was released. It is said the execution was issued to secure the \$750 judgment.

A number of the leading druggists of Milwaukee, Wis., are preparing to fight the Wisconsin Telephone Co. The company, the druggists say, will not allow doctors and other customers to use the telephones in the drug stores, and insist upon the putting in of public pay stations. They talk of combining with the physicians and waging war on the telephone company.

ST. LOUIS.

St. Louis, January 11—With the beginning of the new year the clouds which hovered over the financial horizon for months past are lifting, and a brisk pick-up in business is expected in the next few months. The grand exhibit which St. Louis has been making throughout the entire period of business depression is exceedingly gratifying to her people. All that is hindering a general revival of business now is the tariff question, but this, it is hoped, will be settled in a short time.

The claim of the St. Louis Board of Health and the City Chemist that St. Louis drinking water was being badly polluted by Chicago sewage through the Illinois River, has been knocked out by Mayor C. P. Walbridge, who gives as his opinion, that the pollution of the water is due to local causes and that Chicago has nothing to do with it. The Board of Health, it will be remembered, had caused a chemical examination to be made of the water, and were so sure that Chicago was the source of the pollution that they asked the mayor to institute proceedings to prevent the completion of the Chicago sewage canal, now in course of construction. The board was of the opinion that the additional sewage which would come through the canal would make St. Louis water unfit to drink. The surprise of the Board of Health may be imagined when the mayor not only declined to take any action in the matter, but sent an interesting letter, wherein he relates the results of his personal investigation. He does not favor further superficial work, but believes a sufficient sum should be set aside to go into the matter thoroughly and remedy existing defects.

The latest move of Excise Commissioner Bell is an effort to make druggists and others dealing in "malts" and "bitters" take out dramshop licenses. In an interview he said: "It is my opinion that these proprietary medicines are intoxicating liquors, and I intend, in a day or two, to summon all parties dealing in these goods to appear before me and show cause why they should not take out dramshop licenses. The law says a druggist cannot sell or give away bitters or proprietary medicines containing intoxicating liquors without a written prescription from a regularly registered and practicing physician. If they fail to show that these 'malts' and 'bitters' do not contain intoxicating liquors, then I shall request them to take out licenses, failing to do which I shall have them brought into court." This declaration of war has been the cause of considerable amusement in pharmaceutical circles. One well known drug man spoke thus: "That is the most senseless thing I have heard in a long time. I have consulted a number of legal lights, and I was informed by each that there was no power to prevent a druggist from selling malts and bitters without a license. Again, bitters contain medicinal herbs, compounded with alcohol. We are already paying a license for selling alcohol, and if we were compelled to take out another license for selling bitters we would actually be paying double license. Any attempt to extort from us what is not fair and just will be fought to the bitter end."

William J. Lees, proprietor of the drug store at No. 291 Market street, swore out

a warrant for embezzlement December 3 against James W. Bandell, a former partner. Mr. Lees states that in July, 1880, he picked up Bandell and made him his bookkeeper, and that in December, 1891, he took Bandell into partnership. Lees says that his wife and friends kept warning him that Bandell was robbing him, but every time he asked for an explanation his partner showed the books, and not being an expert, Lees was unable to discover anything wrong. In October, 1893, Bandell secretly sold out his share in the drug store to one Benjamin Perkins. As the latter suited Lees, he entered no objection, and the firm is now Lees & Perkins. Bandell, after selling out his share, went into the real estate business with a man named Ferguson. Since his withdrawal from the drug store Lees has had the books examined by an expert, and finds a shortage of about \$3,000. Since the law does not allow a prosecution for embezzlement committed over three years back, Bandell is only charged with embezzling \$500 between January, 1891 and December 15, 1892, the time he was bookkeeper. No provision is made by the criminal law for the prosecution for embezzlement of one partner by another, and Lees will be obliged to recover the balance by civil action. Bandell has been arrested, and will be vigorously prosecuted.

John S. Moffitt, of the Moffitt-West Drug Co., was unanimously elected first vice-president of the Western Commercial Travelers' Association at the annual election held December 26 in this city.

The Alumni Association of the St. Louis College of Pharmacy, has made elaborate arrangements for the annual ball, to be given Saturday evening, January 20, at the College hall, Nineteenth and Lucas Place.

Dr. Eugene Van Ness, president of the Cooper Pharmacy Company, of St. Louis, has purchased the Kirkwood Leader, a well known suburban newspaper. The name of the paper will be changed to the Kirkwood American.

On Friday, January 12, bids were received by Supply Commissioner John Gilbert for supplying the Insane Asylum, Poor House, Female Hospital and City Hospital with drugs and medicines for the ensuing three months. The bidding was spirited.

The regular quarterly meeting of the Central District Medical Society of Missouri was held at Sedalia January 4. A large attendance was present. "Druggist vs. Doctor" was the title of an interesting paper submitted by Dr. C. M. Decker, of Knobnoster, Mo.

W. T. Harris, a young drug clerk of Bethalto, Ill., while on a visit to this city, met at a down-town resort a convivially-inclined damsel, who relieved him of \$250 in currency, a gold watch and a diamond. He reported the matter to the police. Two days after his employer, George A. Klein, called at police headquarters and wanted him arrested. He said he had sent young Harris to this city with \$100 to pay some bills, which he had failed to do. When Mr. Klein learned the story he withdrew the charge.

Dr. L. S. Stroll, druggist and postmaster at Granville, Ia., has been arrested by the United States postal officials, charged with embezzling postoffice funds and opening mail. The druggist's friends claim the case is instituted through malice.

CLEVELAND.

Cleveland, January 11.—E. A. Schellentrager and a coterie of friends, marshaled by "Brother" Chas. Schellentrager, the county auditor, all noted bon vivants, discussed the following holiday menu at E. A.'s Glenville Sans Souci:

Oysters.
(By St. Clair motor quick dispatch.)
Olives—Malaga. Celery—Glenville.
Bouillon—Bovox.
Champagne Pop Entree.
Glenville Yard Fowl Melee.
(Mrs. Schellentrager's Method.)
Vegetables—Self-raised.
Peppin—Cudahy.
Hasenpfeffer from Corporation Line Rabbits.
Mushrooms—Glenville Rooster Dumphill.
Sauces a la Leick-Mellor Imbrogio.
Eggnog—Carefully Compounded.
Tom and Jerry—Genuine Egg Coloring.
Cal's Breast—Stuffed with Egg Albumen.
Duroy & Haines Vintage.
Sandusky Bay Ducklets, Warranted.
Thuringer Lebkuchen—Jamaica Ginger Flavour.
Holland Cheese, Deodorized with Vermifuge Gelee.
Oranges, Bitter and Sweet.
Glenville Walnuts.
Almonds, Bitter and Sweet.
Glenville Cider,
Served with Two Antidotes.
Liqueur, for Medicinal Use Only.
Digestives, Select Cut-Rate Brands.
Coffee, Certified by Food Inspector.
Cigars, Nicotine-Cured.
Cigarettes, Cubes.

Cubec cigarettes are now in great demand.

Strong, Cobb & Co. find their Kilnol is proving a popular 50-cent article.

The homeopathic pharmacy in the Lenox building has removed to 333 Erie street.

The annexation of Brookline will add several desirable drug stores to Cleveland's list.

Ira M. Drake, a Mt. Vernon, O., druggist, has disappeared, leaving a destitute family.

The Buckeye Radical Rupture Co., of Columbus, has been incorporated with a capital of \$54,000.

Frank Dalrymple's pharmacy, in the Center block, Hicksville, O., was partially destroyed by fire December 30.

Ex-Chief of Police Schmitt has succumbed to an attack of pneumonia. He was the father of Carl P. Schmitt, a local druggist.

J. H. Guthrie, the well-known Conneaut druggist, is also a railroad ticket agent. When the cut-rate fever strikes there he will be right in it.

The case of a well-known patent medicine company against T. H. Goodsell & Co. is to be revived in the United States Circuit Court. Infringement on a tonic bitters is alleged, but denied by the defendants.

Geo. F. Klock, well-known among patent oil and drug men, will remove to Philadelphia in January to assume the management of Berry Bros.' branch office. He has been with the Murphy Vanish Co. for ten years.

Lewis Clark, general merchant and druggist of Brownhelm, was robbed of \$400 in cash and \$115 in township orders on the night of December 12. A night bell worker occupied his attention while an accomplice looted the house.

The name of the Homeopathic Hospital College has been legally changed to the Cleveland University of Medicine and Surgery.

Constance Grosvenor, eldest daughter of Congressman C. H. Grosvenor, was married to Wilson H. McKee, the druggist, at Athens, O., recently.

Aprons the registration of physicians, there is some little discussion of the question whether prescription druggists should be classed as doctors.

Governor McKinley will have to appoint a member to the Pharmacy Board by March 31 next, when the commission of John Weyer, of Hamilton, expires. "Lone Star Jack," a patent medicine vender of national notoriety, fell off a train near Girard, Pa., and was killed. He had relatives in Painesville, O., but claimed a home in Texas.

A. W. Bock, Ontario and Prospect streets, is local agent of the Wonderful Tint Manufacturing Co., of Rochester, N. Y., and is doing a handsome business in the wares of this concern.

Two men and two women visited H. H. Flandermeyer's pharmacy, at 492 St. Clair street, Sunday, December 31, and while the men made a trifling purchase the women lifted \$5 worth of perfumery. They escaped.

A great many druggists who were looking for a brisk holiday cigar trade laid in generous supplies, anticipating a general demand in the 25-in-a-box line. That they reckoned without their host the remnants show.

James Monroe, assistant of H. C. Wells, the Wellsville, O., druggist, and formerly in the employ of O. H. Dixon, of Pittsburg, and the Hires Root Beer Co., committed suicide with morphine. Motive, despondency and excesses.

The controversy between Health Officer Leick and Food Inspector Mellor has resulted in the former bringing charges of incompetency against the latter, which are now being investigated. Dr. Mellor for years kept a drug store on Broadway.

The following standing committees on pharmaceutical and medical societies and schools have been appointed: Senate—Morgrove, Hogg, Plum, Hardesty, Johnson, Earnhart and Hutsiniller. House—Reed, Schuler, Jones, Jacobs, Deaton, Carvin and Bayham.

E. F. Hull, secretary and treasurer of the Champion Chemical Company, Springfield, who recently disappeared, has returned and acknowledges overdrawing his account, but disclaims the shortage of \$5,000 to \$10,000 with which he is charged.

Crow & Whitmarsh are becoming quite personal in their advertisements since the C. P. A. cut-rate schedule went into effect, which is taken as evidence that competition has hurt. They refer to the druggists as sleepers, and wish them an eternal slumber.

At the last meeting of the C. P. A. the following officers were elected for the current year: Thomas Sords, president; D. E. Steuer, first-vice-president; Philip Lehr, second-vice-president; Carl Krebs, secretary; Edward Strong, treasurer. The committees will be appointed at the next meeting.

The master house painters and decorators elected the following officers for 1894: Wm. Downie, president; James Hayr, vice-president; L. W. Weber, treasurer; W. A. De Vries, secretary. Downie, De Vries and S. Towser were chosen

delegates to the national gathering at Baltimore next month.

The Alliance Paint Co., Alliance, O., capital stock \$50,000, was incorporated by John Y. Williams, G. W. Henry, A. L. McDonald, Josse S. Bird and John Thomas.

The spring-like weather, December 23, 24 and 25, started a lively demand for soda drinks, the shoppers fairly flocking into the downtown drug stores. The fountains were generally dry, however. Primitive dispensing methods were resorted to where presence of mind prevailed.

A suit has been filed against the Grassell Chemical Co. by residents in the vicinity of its factories, charging that vapors arising from the manufacture of nitric, sulphuric and other acids, sulphate of soda and sulphate of copper have ruined the vegetation and are detrimental to health. Injunction and damages are prayed for.

The big Detroit and Toledo drug fires aroused general sympathy among the local trade and assistance was generously offered. The destruction of West & Traux's five-story building was complete, entailing a loss of \$35,000 on the building and on the stock, with but partial insurance. The stock of I. N. Reed, the retailer, was also completely destroyed by water and smoke.

A casual remark by Daniel Myers concerning the drug schedule of the Wilson bill at the last session of the C. P. A., led to a general discussion of the objectionable features, but many of the members not being conversant with the schedule as amended, a committee was appointed to peruse the bill and report all changes which might prove cumbersome. These will then be embodied in a formal petition and forwarded to the congressmen of the district.

Cleveland produces more paint material, red and otherwise, than any other city in the United States, and ranks about fourth in the manufacture of varnishes. The trade express the opinion that the Wilson tariff bill in its present form will not noticeably affect the paint business, except as acting indirectly upon the industries in the way of placing smaller orders. So far as foreign competition with the manufactured product is concerned no effect is anticipated.

E. A. Schellentrager is again to the fore with a new enterprise. This time he appears upon the records as the purchaser of Fred Emde's pharmacy, corner Superior street and East Madison avenue. Mr. Emde, being otherwise engaged, his drug business lacked the necessary attention to make it the success which the location alone would reasonably insure. The business will be conducted under the name of Schellentrager & Hoehn, and an efficient assistant has been placed in charge of it. Everything will be overhauled until it reaches Mr. Schellentrager's standard.

One of the promised "reform" bills has been introduced in the legislature by McBride. It requires that the state shall be required to furnish proof of guilt in all prosecutions for violation of the pure drug and food law, thus repealing the section of the present law which makes guilty knowledge presumptive in case a dealer is found to be handling impure drugs or food. State Food Commissioner McNeal ridicules the bill in that it will make a conviction impossible, and asks

Meltride for something more tangible than a burlesque effort if he wish to earn his assistance rather than his opposition.

City Chemist Joseph Mellor has been removed from office, the charges of incompetency against him having been sustained. The qualitative and quantitative analysis of a sample of water and flour required over a week, and the result was so unsatisfactory that "Doc" Mellor was peremptorily invited to henceforth affix an "ex" to his title of city chemist. In the water, which had been doctored with arsenic and tin, Mellor failed to find either, discovering "zinc" in their place. Louis A. Dryfoos, a well-known analytical chemist, was offered the place, but he declined, owing to the salary being but \$1,000 per year. It is probable that chemist Schlewind will be appointed.

HOW THEY SPENT THE HOLIDAYS IN CLEVELAND.

AJ Peterslidge—Priding himself on being the only person of this name in town.
Carl Schmitt—Praying for Brooklyn's annexation to Cleveland.

Edo. Claassen—Inquiring into the merits of the Mellor-Leick chemical essays.

Billy Horsch—Wondering why that wag did not send the razor-back hog to Stecher Bros., the barber druggists.

Franz Kelper—Getting his pharmaceutical journals ready for the bookbinder.

E. A. Schellentrager—Adding to the comforts of his luxurious (Henville home).
"Jim" Bruce—Celebrating the fact that he was born lucky.

Ludwig Kelper—Associating in his mind with the deutsch-laendische wohnachtsrueder.

J. A. Bartlett—Calling hello over line A.
Henry Bechberger—Guessing what the C. P. A. will be doing next.

"Triple Alliance" Benfield—Making the rounds of his three pharmacies.

Wm. Bodebender—Inventing burglar-proof plate glass.

S. P. Churchill—Wondering whether friendship is worth seeking.

L. Dreher—Testing his conversational powers with the avenue belles.

Theo. Claus—Holding his customers spellbound with his characteristic ear whisper.

Jim Ferguson—Pointing out the beauties of Wade Park's panorama.

"American House" George—Consoling the homeless traveling men.

G. L. Hechler—Plausibly calculating the relation of ice sports to artificial limbs.

K. P. Humiston—Laying out plans for vaccine farming.

R. Parsons—Reaping a harvest of catarrh cure shekels.

W. F. Steadman—Still rejoicing over the advent of St. Clair street motor cars.

O. R. Goodyear—Weighing the advisability of changing his name to suit the times.

W. H. Flood—Turning over a new leaf in some humorous paper.

J. H. Silberling—Denying any ancestral connection with the Judas coin.

F. L. Gegelein—Disapproving of a cut-rate style in holiday feasting.

C. Krebs—Gathering courage for '94.
John Krause—Forecasting probabilities.

J. J. Riegelhaupt—Filling his own prescriptions.

C. W. Smith—Contemplating the complicated life of a suburban druggist.

J. S. Wood—Missing connections with the Collingwood Interurban.

BUFFALO.

Buffalo, January 11.—The drug trade is fully good, much to the wonder of most of the dealers. Most of them report a larger holiday business than ever before, and all appear to have done much better than they expected, that is to say, well. The explanation of this is that the holiday gift habit has become so firmly fixed that it cannot be broken off, even with short purses to meet it, and so the buying was confined to inexpensive articles. The druggists have of late been so cut under by the dry goods stores that they have put in very little holiday stuff that was expensive, so sales were lively. There is no special demand for any particular goods. Hot soda sells more freely than ever before, and the trade is in quite fair shape, considering the times. Wholesale report a very brisk trade.

Foster, Milburn & Co., who rent and occupy in part the Berick building, at Swan and Elliott streets, have a problem before them in the shape of a condemnation of the block by the factory inspector, who claims that the floors are shaky and that there are not enough fire escapes. Steps will be taken at once to make good the defects. This company, long prominent for the manufacture of Burdock Blood Bitters, has about forty employees in the building. The hard times have struck such concerns to the tune of 30 or 40 per cent, as other proprietary establishments besides this one acknowledge, but all have retrenched considerably, especially in advertising. The theory is that people have not the money to buy medicine with, so neither advertising nor any other means will bring it. Well-to-do people at such times shorten purchases of medicine and poor people go to the free dispensaries.

There is a diversion in the line of cut-rate dealing. Boston sends out a dispatch stating that manufacturers and wholesalers were trying to shut off not only the cut-rate dealers, but also those who are substituting their own preparations for the regular patent medicines, which latter practice is always reckoned a crime by manufacturers. The Buffalo retailers deny that they are cutting rates, and most of them are in an organization having a forfeit pledging them to maintain rates. The fact that the pharmaceutical association has not met in a long time is evidence that there is no great disturbance in the trade, such as general cutting would produce, for the association exists mainly for the purpose of looking after such matters.

The Buffalo retailers have, to some extent, gone into the coupon business, after the fashion of the soapmakers, giving out a ticket with every purchase of a dollar, which, with other tickets, calls for some article supposed to be valuable to the customer. An effort has been made to stop this practice, which really amounts to cutting rates, and it has already partly succeeded. A certain cyclopedia company has twenty-three druggists on its list.

The old Arcade building, which burned down last month, did not contain a drug store, though it did contain about everything else. The Hart Rheumatic Company, which was located on the second floor, was completely burned out. It had a large stock of medicine, advertising matter and other goods on hand, and estimates the loss at fully \$5,000, which is not covered by any insurance.

The Erie County Board of Pharmacy

granted six licenses at its second December meeting, Jacob P. Billett, Charles T. Bischof, John Levinson and Valentine E. Euler receiving full pharmacists' papers, and Alf. E. Cavers and Fred C. Kelley receiving assistants' licenses. Mr. Bischof is a graduate of the New York College of Pharmacy and Mr. Levinson came from New York. Mr. Cavers came from Canada, Mr. Billett from Tonawanda. Mr. Kelley is with Dr. Ray W. Pierce and Mr. Euler is at Tilma's drug store.

There is considerable complaint among local druggists of the way Carlsbad salts are manipulated by the manufacturers or their New York agents. So many times has the price been put up that it is now almost out of the reach of the retail trade. One dealer who bought a quantity some years ago has most of it on hand, and is asking other druggists to help him out. The result of the high price is that substitutes have been put on the market by one and another, and this is the reason why the Carlsbad remains on hand.

Some small boys learned a few days ago that naphtha is explosive, even if it is a mere residue in a barrel supposed to be empty. The barrel was standing in front of the Buffalo Refining Co.'s office on lower Main street, and these urchins amused themselves for a while by throwing lighted matches into the bung-hole. After considerable maneuvering in this way the gas in the barrel exploded, wrecking the barrel and waking up the neighborhood. Had the boys stood at the end instead of the side of the barrel they would have been killed, as the heads were blown some distance.

Among the few new articles in the drug trade is the Norwich Pharmacal Co.'s (New York) Unguentine, an ointment base, which is well received by the dealers.

Dambach & Co., who have a drug store at Main and Chippewa streets and another on Seneca street, have lately been resolved into W. C. Dambach, Dr. Lothering retiring.

J. P. Billett, of Stanley & Billett, druggists of Tonawanda, has bought out the drug store of William Coleman on Connecticut street. Mr. Stanley will continue the Tonawanda store alone.

R. K. Smither, the druggist-alderman, is president of the board this year, a place for which his character and experience well fit him. He was for some years at the head of the Board of Supervisors.

The drug store of Edward A. Kingston, at Main and Ferry streets, was burglarized a few nights ago by what proved to be a former employe, who carried off a lot of cigars and a small amount of money.

The pharmacy college students are back from vacation, getting ready for the mid-season examination, which now, by a most acceptable change of time, comes just after a chance is given for review and general preparation.

Fred A. Darrin, a bright pharmacist, who left the business last year to try a hand at the baking profession, has given up the venture and is doing relief work in drug stores. He is preparing to go into the ice cream trade in the spring.

H. W. Wagner, formerly of Chicago, will open a fine new store at 313 William street. The fixtures are in white and gold, supplied by Buffalo parties. The shelf-ware and show bottles come from Whittall, Tatum & Co., and Plimpton, Cowan

& Co., of this city, contribute the stock of sundries, etc.

W. H. Chase, who has drug stores on Forest avenue and at the corner of Ferry and Grant streets, has opened an elegant new one at No. 226 Main street, in the new Parkside district. It is said that there are very few finer ones in the whole city of Buffalo.

The smuggling industry is quiet at present. Dealers know this from the fact that there are no nondescript people blowing in with opium, antipyrine, phenacetine and similar expensive but unidentifiable articles to sell at cut rates. At certain seasons of the year these people are quite numerous.

A number of pharmacy college men, including Profs. Hill, Gregory, Long and Gray, besides several graduates, are preparing to buy a summer lodge in the Adirondacks. Prof. Hill went to his old home at Watertown during the holidays and looked out a location on Horseshoe Pond, ten miles from Tupper Lake, which has a hotel. There is also a railroad station and boarding house across the pond, but of easy approach to it only across the pond. From 5 to 100 acres of land will be bought, according to price, and a lodge will be built suitable for occupation by women and children, and a point from which parties can go on fishing and hunting trips of one or more days in length. This region has always been a great favorite with the Buffalo University men, so much so that a number of them gave up the World's Fair for it.

Dr. Frank P. Vandenberg, the analytical chemist, has been engaged in some very interesting work lately in connection with the adjustment of claims against the city of Syracuse in its efforts to secure a water supply from Skaneateles Lake. There are about forty mills on the outlet of the lake, all of which must be bought up before any water can be taken. Dr. Vandenberg was retained by the Glenside Woolen Mill, which gets water for dyeing purposes from a spring some distance from the outlet. The mill made claims for the spring, but the city declared that it was not dependent on the outlet as its source. Dr. Vandenberg took steps to prove the matter by throwing into the outlet a quantity of the chloride of lithium, and in eight hours he found lithium in the spring. Having tested both the outlet and the spring for lithium previous to the use of it, the experiment was apparently successful, but, to furnish a second proof, the doctor threw into the outlet ten pounds of fluoresceine, and the peculiar greenish tint given water by the dispersion of light produced by this drug was soon very apparent in the water.

These drugs are so scarce that almost the whole supply of the country had to be used. Only the carbonate of lithium could be found even in New York, the doctor himself converting it into the chloride. His purchase of twenty-five pounds so exhausted the supply that the price was at once advanced, and the Buffalo users of lithium were soon besetting the doctor to learn what had happened. Syracuse was to get the Skaneateles water for about \$2,500,000, according to the estimate, but the cost is already \$12,000,000, with no indication of the end of the expense. Dr. Vandenberg's legal difficulties with Charles Platt, his late partner, have been settled, and he is back at his laboratory again.

LOUISVILLE.

Louisville, January 11.—The expectation of legislation on the part of Congress has led most of the local distillers to resume operations. The whiskey men seem anxious to get on hand as big a supply as possible before any new provisions should become operative. The new legislation would of course not have a retroactive effect and the liquor dealers would be ahead just that much. Among the distillers which have already started are the Old Times, Mellwood, Fern Cliff, Crystal Springs, Rosenfield Bros Co., John G. Roach & Co., Rugby Distilling Company and the J. G. Mattingly Company. Thousands of workmen have been given employment by the resumption. As to the question of an increased tax, the whiskey men here are divided. Some think it will be greatly beneficial to the trade, while others cannot see it that way and insist that it is the very worst thing that could happen. Some think that while an increase in the tax may prove of temporary benefit, it will result in loss in the long run owing to the decreased consumption. Of course in these views, the extended bonded period is taken into consideration.

The following call has been sent out by Secretary Frick, of the Interstate Retail Druggists' League:

"The crisis is over and the Interstate Retail Druggists' League, having a remedy in the Detroit plan, will endeavor with the co-operation of the retail druggists of the United States to put this plan in force. You all are no doubt familiar with this plan, which was adopted at Detroit at the meeting of the N. W. D. A., and it is upon this plan, we hope to accomplish our object. The work done during the past few months has been very successful in many localities in the East, and it is this success which has prevailed on the officers of the league to call a special meeting of this body in New York City on Tuesday, February 6, 1894, at Ionic Room, Terrace Garden, 149 East Fifty-eighth street, at 10 o'clock a. m. By reading the president's address you will more fully understand what is desired to be accomplished at this meeting. Before the league was organized a few years ago at St. Louis, the retail trade in many sections was in a demoralized condition. The few states represented at St. Louis were taken with a whim and in the course of eighteen months had over twenty different states interested in our work. Up to that time the jobbers and manufacturers thought it useless to listen to the retailer's plea. But look back at their meetings and you will notice the interest the retailers have awakened in them. They have shown their good will by offering a plan whereby we can eventually accomplish our object. But it needs the hearty co-operation of all the druggists of the United States. Therefore we kindly urge you to bring this matter before your local associations and urge them to send representatives to this meeting, or if not able to be present in person, have them take action on the matter and send the report to the meeting. We are in a position now to be able to accomplish some good and we need your assistance. For further information address the secretary of the league. For hotel accommodations and other matters concerning the meeting, address state executives of New York, Mr. V. Kostka, No. 700 Ninth avenue, New York City."

This is a matter in which the league is deeply interested and it is expected that the meeting will be marked by a large attendance.

The Botanical Club has effected a satisfactory compromise with the dry goods houses of the city. The houses agree not to handle any article of medicinal value such as vaseline, ammonia, camphor, etc. They will, however, continue to sell toilet articles. For some

time there was a good outlook for a merry war between the retailers and the dry goods merchants. Most of the drug men are eminently satisfied with the new arrangement. It is fortunate that the concession was obtained, as of late the dry goods houses have been making inroads on the drug trade in certain of its departments. The next meeting of the Botanical Club will be the one for election of officers. At the last meeting there was a veritable flood of eloquence and it is promised that this will continue at the next meeting also. The club is now in a prosperous condition and it has begun the new year with every assurance of greater prosperity than ever. Every druggist in the city, with but one or two exceptions, is a member.

Druggists report that collections with the opening of the year do not show much improvement and trade is about in the same condition. Of course this result is naturally looked for just after the holidays and will hardly give place to livelier times for a month or so yet. The extremely warm temperature here recently has also had a bad effect on the prescription business for the past two or three weeks. Christmas Day in Louisville was almost as balmy and pleasant as a day in June.

Mr. Addison Dimmitt, a brilliant young pharmacist, has been notified that he is the winner of the first prize for an essay on substitution. The prize was offered by the New York College of Pharmacy in a national contest. Mr. Dimmitt has previously taken the prize given by the Kentucky Pharmaceutical Association on this subject.

INDIANAPOLIS.

Indianapolis, January 11.—In a suit brought at Terre Haute by an anti-vaccinationist to restrain a teacher from excluding his son from school because he had not been vaccinated, the County Court has decreed that, under the present rules of the State Board of Health, the local board has no power to compel a healthy child, not exposed to small-pox, to be vaccinated or to quit school. The court expressed no opinion on the power of a Board of Health of a city or state or of the Legislature in a similar case.

The Supreme Court has granted a rehearing in the case of the State vs. Parker and McAfee, the colored youths charged with the murder of druggist Eyster, on account of alleged irregularities in the former trial. The court says the testimony of Mrs. Eyster: "My husband said to me when I got to 'him, my God, those colored boys who were in here have killed me" should not have been admitted, not being part of the res gesta. Under the original judgment the boys would have been hanged on the 7th inst.

A Lawrenceburg druggist is charged with carelessness that threatens to cause the loss of eyesight to a minister in a neighboring town. The latter was given a big quantity of quinine without a proper label and the minister's wife used it instead of the proper drug. Her husband soon lost both sight and hearing, but rallied and is now suffering but the one affliction, blindness.

Winfield Scott Lynn, for nearly a quarter of a century a fixture in the Browning drug store, of this city, seems to be in imminent peril of becoming suddenly rich. Mr. Lynn's mother was a granddaughter of Isaac Williams, who figured

conspicuously in the romantic marriage of the daughter of Lord Townley, of England, a little over a century ago. Lord Townley died in 1791, leaving an immense estate which has not yet been distributed to his heirs. The Chicago Herald says that interests of the heirs of Lord Townley are now in the hands of a competent English lawyer, with almost a certainty of an early distribution of a fabulous sum, which has been over a century in the Bank of England, awaiting proper claimants. It is difficult to say what Mr. Lynn's share will be. It cannot be less than \$100,000, and it may be \$500,000 or more, depending, of course, upon the number of heirs who may be able to prove their title to a share. Mr. Lynn is not overconfident, however, of getting any portion of the estate, because, when such an estate lies unclaimed in England for thirty years, it cheats to the crown.

There are 7,291 members in the Indiana Traveling Men's Association.

William E. Lee, shipping clerk at A. Klefer & Co., died on the 4th inst.

Lou Plogsterth, of Riggs & Plogsterth, druggists of Marion, spent the holidays with his mother in this city.

Dr. H. Lindley, of H. Lindley & Sons, druggists, Bloomington, Ind., was one whose recent death is much mourned by brother druggists.

Frank Best, formerly in business at Ninth street and College avenue, this city, has purchased the store of A. A. Wells, Lafayette.

Frank Leese, Danville, Ill., has taken a position with A. Klefer & Co., representing the firm's clear interests in Billions and Western Indiana.

Fire at Red Key on the 2nd inst. destroyed seven business houses and three dwellings, among them being the drug store of Charles Walker, whose loss was \$5,000, insured for \$2,000.

Chas. L. Kackson, for several months prescription clerk with Henry Gante, Anderson, Ind., skipped town recently, leaving numerous bills, which he forgot to cancel. He was a skilled telegraph operator, and it is thought that he is at work on some railroad.

The wholesalers report trade opening briskly for '94, and they infer that the retailers must be doing correspondingly well. The general tone is hopeful, and the feeling is that the new year will not experience the pinch that has been the chief characteristic of '93.

Dr. E. A. Guy, once of the Ohio drug store of Valparaiso, this state, and who gained notoriety by swindling wealthy widows, has been arrested, tried on the charge of stealing \$250 from Mrs. Emma Spangenburg, of Galena, and in default of bail put in jail at Berrien Springs.

S. H. Eustis, Shelbyville, has recovered from the effects of the fire that for awhile stopped the wheels of business, and he is now pacing along in old style.

Campbell & Kersey are the successors of G. J. Rhorer, Darlington, Ind. Mr. Rhorer was forced from the business by ill health.

G. H. Cane's drug store at Knightsville was visited by burglars on the night of the 3rd inst. The safe was intact, but showed signs that it had been tampered with, and a can of powder lay suspiciously near it. The more valuable and portable articles in the store were taken by the plunderers, who were evidently

disturbed before they were through with their intended visit.

Councilman Colter, who is foremost in the fight to make drug stores take out a city license for the sale of liquor, is authoritatively for the statement that the government receives more revenue from Hendricks County than from any other county in the state. There are no saloons in Hendricks County and liquors are dispensed from drug (?) stores.

Three or four years ago Capt. Hardy, of Loganport, joined the combine known as the National Lined Oil Company, taking his pay in stock for his mill. Last week the trust sent a Detroit man to supersede him as manager, but he refused to surrender possession and appealed to the authorities for protection. He says the trust is trying to ruin his business.

Several men of this city, who use alcohol in their business, were remarking to each other casually that their stock-in-hand appeared to disappear much more quickly now than formerly. A book-binder confessed that he knew not how to stop the petty pilfering of his employes, a foundryman suggested doctoring it with gum shellac, but a druggist informed them that a small quantity of aloes might save the alcohol, while not injuring it for mechanical purposes.

Henry J. Huder began the new year by opening his new drug store at Washington and Pennsylvania streets, the two most prominent thoroughfares in this city. He occupies the room that was formerly tenanted by the Indianapolis National Bank, and he has fitted it up in a style not surpassed for elegance by any drug store in the city. Mr. Huder was an unqualified success as a druggist during the years that he shared work and profit with Mr. Pomeroy, and his prosperity promises to continue and increase now that he is "going it alone."

The metric system has been adopted by many of the druggists of this state since the receipt of the Pharmacopoeia.

Dr. Hammond, one of the three members of the Board of Health of this city, complains of the high-priced drugs that are bought for the city dispensary. He says also that, in order to cut down the expenses of the dispensary, a man was put in to make the tinctures and fluid extracts, but the bills are still coming in for these drugs, and the dispensary superintendent reports that he can buy them cheaper at wholesale than he can make them.

The one Indianapolis cutter is still a fly pestering the bald heads of the legitimates. Some excitement was created at the last meeting of the local association by the expression of some of the druggists that he ought either to be brought promptly into the ranks or be suppressed by a grand assault of price-cutting by all hands. Others advocated the establishment of another cutter alongside of him to do him up as David did Goliath and return in triumph to the association army. Wiser counsel prevailed and it was decided that, as he was hurting no one in particular and all very little in general, it would be well to let him fall naturally and freely into a state of complete and innocuous desuetude.

The Boehme Drug Company, Superior, Wis., has temporarily suspended. The business may be carried on by the assignee.

ATLANTA, GA.

Atlanta, Ga., January 11.—Business in this section is still without any marked signs of improvement. The holiday trade was not what was expected, it being the dullest in many years. Prescription trade is actually dead.

The people of Atlanta are now beginning to boom the "Cotton States and Pan-American Exposition," to be held here in the fall of 1895.

Harvey & Harvey, druggists, Valdosta, Ga., sustained a small loss by fire on December 24. Covered by insurance.

Dr. Geo. F. Payne, Georgia's state chemist, was recently elected to an honorary fellowship in the London Chemical Society.

At a large fire in Dublin, Ga., Tarpley & Kellam's drug store was totally destroyed. They were insured for \$2,500 on a \$4,000 stock.

Dr. Wise, druggist in the employ of Whitehead & McMaster, Waynesboro, Ga., attempted suicide by shooting himself twice in the breast. He is dangerously shot, and not expected to live.

On Sunday night, December 24, the window in Abernathy's drug store on Decatur street was broken into and some fireworks stolen. The thief was captured as he was crawling out of the window.

On the morning of December 27 the Leonard & Ellis oil and paint works, Birmingham, Ala., were consumed by fire, with \$7,000 worth of stock. The loss, which exceeds \$18,000, was covered by insurance.

Several of the druggists of Atlanta have a novel and quick method for delivering their packages by means of bicycles. Those who do not own vehicles of this kind patronize the Bicycle Messenger Service Co., who deliver packages for seven and a half cents each.

The Southern Perfumery Co., of this city, has been organized with a paid up capital stock of \$25,000. The officers are: J. H. Porter, president; J. F. Renfro, manager; Edgar Bridger, secretary, and E. L. Bergstrom, chemist. The company intends, at an early day, to manufacture toilet soaps, and also to extend their territory further west.

The evening of December 30 the employees of the order department of the Lamar & Rankin Drug Co. were tendered a banquet by Mr. D. R. Stauffacher, who was formerly at the head of this department. Covers were laid for twelve guests, and the supper was an elegant one. Several toasts were drunk to the host, and J. D. Lee responded to "Our Host" in a very happy manner. J. L. Sutton spoke of "Pleasant Days, Past and Present." The evening was a most enjoyable one.

The druggists of South Carolina have a very hard time of it in securing their alcohol. They must buy it from the county dispensary, where they pay a little more than actual cost and 10 per cent profit for liquors. They are compelled to keep and file with the county board of control a sworn statement of the uses to which the alcohol is to be put, and should they dispose of it in any other way, they are liable to all the penalties provided for violators of the law, and shall also forfeit their licenses as pharmacists.

Witmer's drug store, Dubuque, Ia., was burglarized recently. Quite a sum of money was secured by the burglars.

BOARDS OF PHARMACY.

Alabama Board of Pharmacy will meet in Montgomery, January 25th, 1894.

Massachusetts Board of Pharmacy held sessions December 19, 21 and 22, and examined forty-four applicants. The following were the successful candidates: A. B. Kelley, John Parr, Lawrence; F. H. Holt, D. W. Rintel, W. H. Standard, J. A. Munkley, Boston; G. F. Butler, Watertown; A. C. Wagner, Everett; H. E. Brier, Cottage City; H. E. Bowman, Somerville; E. S. Blumenkranz, Newport, R. I.; W. H. Wallace, Belmont; Claude Curtis, Rockport; W. H. Davis, Fall River; E. D. Hatch, Melrose; Howard W. Nowell, Merrimac.

The Ontario College of Pharmacy at its forty-sixth semi-annual examination, held December 20th, 1893, announces the following successful candidates in the various grades: Passed in order of merit—Walter B. Scott, Port Hope; C. A. Buchanan, Kemptville; Geo. C. Park, Chatham; Thos. Rowland, Toronto; Wm. H. Rutledge, Creemore. Roiph, T. Shepherd, Stayner. Passed in subjects now and on previous occasions—Dugald Campbell, Atwood; Harry W. Love, Toronto; Alex Ray, Belleville; Colin McIntyre, St. Thomas; Arthur S. Hopkins, Toronto; H. F. Gordon, Woodstock. Candidates who succeeded in taking four subjects—John Gordan, Woodstock. Candidate who succeeded in taking one subject now and four on previous occasions—Leon Albert Goodacre, London; Jas. M. A. Waugh, Wallaceburg.

The American Chemical Society held its annual meeting at Johns Hopkins University, Baltimore, December 27 and 28. President D. C. Gillman, of the university, made the address of welcome, and H. W. Wiley, president of the society, replied. The society has four local sections—in New York, Newport, R. I., Cincinnati and Washington, and a membership of about 600. A number of valuable papers were read and discussed. At the business session the advisability of getting a national charter for the society was discussed, as it is at present a national organization working under a charter of the State of New York. This causes a double set of governing bodies, a board of four directors, comprising residents of New York, and a national council of equal membership. The report of a special committee advising the society to secure a charter from the national government was read and referred to the council for action. Before adjourning, the following officers were elected for the ensuing year: President, H. W. Wiley, Washington; general secretary, Albert C. Hale, Brooklyn; treasurer, C. F. McKenna, New York; librarian, C. E. Dodge, New York. Council, C. B. Dudley, Altoona, Pa.; C. E. Monroe, Columbian University; William McCormurtrie, New York; J. H. Appleton, Providence, R. I. Directors, C. F. Chandler, P. T. Ansten, C. A. Doremus and M. Carrington Bolton. The time and place for the next meeting will be determined by the council of the society.

Three druggists recently paid \$49.75 each in a Kansas City, Mo., court for selling liquor without a license. One of the druggists is credited with saying that he was glad he was fined, as he could now refuse to sell any more liquors and thought the business should be stopped.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

THEY ARE NOT CUTTERS.

To the Editor:

I beg to inform you that here in Worcester there has existed a Pharmacists' Association for nine months. Messrs. P. B. Moriarty & Co. and W. M. Maynard are good and loyal members and should be removed from the list of cutters (Era, January 1). The uniform price adopted by the association is 20 per cent from list price. If you should have occasion to print a list again please drop those names.

Respectfully,

W. S. DOANE,
On Executive Committee.
Worcester, Mass., January 9, 1894.

LONDON LETTER.

One thousand eight hundred and ninety-three has ceased to exist. It has been full of memorable experiences to the druggist, and that for many reasons, and while there have been the usual glimpses of the silver lining which it is said accompanies every cloud, no matter how black and dismal the side nearest the earth may seem, all has not been exactly as most of the mercantile community could have wished. But this is a state of affairs which has obtained since the world began, and it therefore behoves all enterprising merchants to get out of the well-trodden path which has been made by successive generations, and track out something new and better for themselves, as there is no reason why the present generation should follow the antiquated methods of those who have gone before, except, perhaps, in those features respecting integrity and thoroughness, for which many of our ancestors have been noted.

To bring about a state of matters which will benefit the great mass of retail druggists, and also those in other branches of commerce, it would seem that it is absolutely necessary to bring the inventive faculties into requisition, and employ them in a new line, as any suggestions which have been made up till now have been lacking the feature of practical workability. Much correspondence has been going on in some of the better known journals as to the best means to encourage sociability in small communities, and some of the plans would perhaps admit of being adapted to the needs of the drug trade as there should be undoubtedly more intercourse between the members thereof than there is at present. This of course alludes to the condition of affairs in this country, and may not appertain to those of other lands. In any case, however, it never does any harm to endeavor to improve matters, and the time has arrived when all members of any one trade should act in unison, and abolish the cut-throat policy which has now obtained for a very long period. The difficulty lies in the old complaint—the profession contains more assistants than there is need for, and when one of these is dispensed with as a consequence of the bad times, there are too many wholesale houses who are willing to start the youth on his account, the usual method being to have a mort-

take on the goods supplied, which includes fixtures as well as the stock of saleable goods.

This is a question which has agitated the minds of a great many of the druggists who take an interest in the welfare of the younger members of the trade, but the difficulty appears to be as far from being solved as ever it was. Emigration is often regarded as a safe means of remedying the evil, but those who speak of this as a way out of the problem, speak unadvisedly, as there are continually reaching these islands reports of non-success in the parts of the globe which are thought to be the best places to make a good living.

One effective way of deterring many a young man from entering on his career as a druggist is the ever-increasing severity of the examinations set forth by the Pharmaceutical Society, and the profession is also supplied with a better class of assistants, as those who pull through nowadays, must be made of the proper stuff, and are well able to make up the prescriptions of their allies—the doctors. As regards the latter profession, it would be a good thing if the powers that be would make the exam. papers for the materia medica a little stiffer, as a good many seem to be strangely at sea at times respecting this subject. It is bound to come.

The entire mercantile community throughout Great Britain has been more or less disturbed in the operation of their respective businesses on account of various causes, but chiefly in consequence of strikes, which apparently result in no good to anybody—at any rate this is the general feeling here. Much suffering has resulted, and a large number of deserving people have been thrown out of employment as an indirect effect of those who thought to better their own positions. They have not done so, but on the contrary, they have contributed in a great degree to the discomfort of many others. At times during the great coal strikes, manufacturing chemists were at their wits' end to know how to fill orders which were urgently required, and a long list of inconveniences could be recounted on this score. Expenses of working have been increased, and while profits have not participated in an increase the general expenditure of maintaining the store in a decent manner has gone up. The peculiarity of these affairs is, that when they once rise, they never come down again. So, within the past five years, disbursements in the ordinary routine of business have multiplied in an alarming manner, without a corresponding augmentation of the receipts. This is a mystery which ought to be looked into, and, if possible, rectified.

The defunct year has witnessed the adoption of many new business methods—good, and otherwise—and our forefathers would be shocked at the idea of consigning several time-honored systems to oblivion, although it would not be assuming too much to suppose that at some time or other in the far distant future, the same will be resurrected, and shot upon our descendants as "something new." On the whole, however, no good thing is abolished without some adequate cause, and there can be no doubt that there are many things which will stand a good deal of revising, if not total obliteration.

The receipts both as regards the retail and wholesale sections of the drug business, have been much less than former years,

and when it is borne in mind that some factories were stopped altogether for a time for lack of coals, it will be readily seen that nothing else could have been looked for. The retail suffered as there was a dearth of money in circulation, and the majority of retailers preferred not to do the business, than to risk the probability of a large contingent of bad debts; it is reported from two or three quarters, however, that those who gave practically unlimited credit, did a good thing for themselves in the way of advertising, besides getting quit of a good deal of stock which they could not have disposed of at ordinary times.

Notwithstanding the good fortune of a few, most people in business think that the best system is to keep clear of all risks, and rather keep their hard earned cash in a safe than shovel out goods which have to be paid for. There are times when the proportion of risk to the amount of profit to be obtained, appears to be very large, and on the occasions alluded to, those who staked a little have come out on the right side. When this may happen once, it is always highly probable that things will not come out as anticipated, and, therefore no blame can be attached to those who prefer prudence to any species of speculation.

The holiday season has this year made up for a good deal of the bad times, and sales have been quite satisfactory. There has been unlimited choice so that there was very little exertion required to make sales, and this is exceptionally lucky, as it so happens in many cases that the prescription departments have required a good deal of attention, and as this is the chief object of the druggists' life, it would never do to allow matters in this direction to fall behind.

The departed year has seen what is believed to be the last of some of the more objectionable cutting concerns, and their demise will not raise up any feelings of regret in any quarter. It is a source of immense satisfaction to the drug trade to see this system of dealing being relegated to the past, where it ought to have been long since. It yet remains with those interested to subdue the illegitimate sales of registered poisons which are still going on in many places quite openly, and that this acts prejudicially to the druggists is beyond question, while the peril to which the public is subjected is not slight, many deaths taking place from time to time as a result of improper handling of dangerous substances.

The recent prosecutions have had the effect of lessening the desire on the part of traders other than druggists, to deal in this class of commodity, as there are few people who wittingly lay themselves open to being fined, and it is noticeable that the penalties which are being inflicted are ever on the increase, so that in the near future, the cases will be fewer in number. This is a good thing for the retail trade, and should help it considerably.

It is a matter to be regretted that the wholesale trade are in no wise protected as the laws governing the wholesale sales of poisons are quite inadequate for the responsibility which rests on those dealing in such articles. Repeated attempts have been made to effect this but there is some reason which is not known to outsiders which prevents the passage of bills to remedy this state of affairs. Sooner or later, however, there will have to be something done to set these matters right, and

thereby afford means of protection to the public as well as those of the mercantile community who are interested.

The balancing of the books is at this season of the year a rather formidable occupation, and it is to be feared that things will not look over bright, as the sundry hindrances to commerce during the year which has just closed must have made themselves felt in various ways. A great many of the firms which have for a long time been considered unsafe to deal with have accumulated to the bad times, so that the constant watching of their accounts will save some trouble, and also anxiety, which was not worth the trouble, considering the small margin to be got out of this sort of customer.

The new introductions which first saw the light during 1893 have been fairly numerous, and withal good value both to those who have to retail them and also to the public, and, as it is the latter who make the access or otherwise of any article, their opinion ought to be secured in some way before flooding the markets with something which will not sell or which might bring discredit on the manufacturers and the retailers. The number of shoddy articles is, however, on the decrease and it is a matter of congratulation to all concerned, as many customers are lost, through a retail druggist unwittingly supplying goods which are not what they are represented to be in public advertisements, and elsewhere. A goodly number of proprietary articles have seen their last through being puffed injudiciously, and claiming virtues which were not a component part of their manufacture. The market is gradually being cleared out of much trash, and where such goods are now being sold is a question which no one seems to be able to answer, but no doubt, the whereabouts could be ascertained if any took the interest and the trouble to make the necessary inquiries, but the subject is not important enough to render the taking of any trouble worth while. That the goods continue to be made and sold is quite certain, as occasionally one hears of them either from a traveling man or a price list. They are about played out, however, and as a consequence many people will be able to keep their money in their pockets, or purchase goods which are more stable in character.

The immediate prospects of the retail and wholesale sections of the trade are by no means certain, as there is usually a prolonged lull after the holidays, except there be some special reason for rendering the prescription department active. The wholesale branch will, without doubt, be "slack" for a couple of months, at least, but they will in all likelihood be able to do something during that period to prepare for the regular spring and summer trade, which follows then.

The junior students of the Philadelphia College of Pharmacy made a bet recently that, within a month the blue and white, college colors, would float from the stage of the Bijou Theater. The bet was won the other evening by an understanding with the assistant of a lady mind reader, who was giving an entertainment. During the performance the young lady was seen to come down into the audience, remove the ribbons from one of the students present, pin them on herself, and walk back to the stage in full sight of the audience. The bet was won.

TRADE COMMENT.

DIRECTORY SUPPLEMENTS.

The third (1900) edition of the Era Drugists Directory has now been issued, and we shall begin the regular publication of the "Supplements" to this new edition in the next (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. address

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

Soap was first manufactured in London in 1524.

Mich phosphate beds have been discovered in Lewis County, Tenn.

The pearl is only carbonate of lime, is readily affected by acids, and burns into lime.

Manchester, England, has been lately made a seaport by the completion of a ship canal.

Courses in "advertising" have lately been introduced in several progressive business colleges.

A sponge has been found on the coast of Florida with a circumference of 5 feet 6 inches.

The mica deposits at the Fortner mine, in Fannin Co., Fla., are reported as being developed for an Ohio syndicate.

Two hundred and eighteen thousand tons of phosphate have been mined in South Carolina during the last year.

It is said that the work of engraving the plate for the World's Fair diplomas will not be finished in less than a year.

The Government of India has appropriated 10,000 rupees for the equipment of a bacteriological laboratory at Agra.

Brunswick, Ga., exported over eight millions' worth of goods during 1893. A great part of this trade consisted of naval stores, etc.

The Grangers are engaged in a warfare against artificial butter in the State of New York. They want it taxed to the extent of seven cents per pound.

It is said that the postal authorities will soon discontinue the issue of two sizes of postal cards, and will hereafter furnish but one size only, 3½ by 5¼ inches.

A bill has been introduced at Montreal prohibiting the sale, by grocers or merchants not registered pharmacists, of chemicals, drugs and patent medicines. It has developed a great deal of opposition, and the result is awaited with interest.

The Savannah Board of Trade has been investigating adulterated turpentine, and has found that cheating by the use of irregular barrels is quite frequent. The propriety of selling this product by weight is being seriously agitated in some quarters.

It is estimated that the receipts of vanilla beans for 1893 are 30,000 pounds below those of the previous year.

The work on the die for the World's Fair medals was begun during the first week of this year at the Philadelphia mint. It will require several months to complete the die.

When a woman reads an article on the vulgarity of chewing gum it reminds her, says the *Atchison Globe*, that she hasn't had any to chew for several days, and she sends out to get some.

Here is a pointer for housewives and washers: Put a wineglassful of strong borax water in a pint of raw starch, and you can do up collars and cuffs as stiff as any laundry.

The Marquis Van Dickens (at the swell-est ball in London)—"Surely I have seen your beautiful face before, Miss Saint-louis?" Miss Saint-louis—"More'n likely. Pa used it on all his patent-medicine ads as 'after taking.'"—Chicago Record.

An editor out west who sends his paper out to "time subscribers" sends a bill each year. When a second bill is sent and there is no response he takes it for granted that the subscriber is dead, and publishes an "obituary notice" in his columns.

A life insurance company of India which enjoys a monopoly of the native business, makes no distinction in the way of extra premiums from opium users, and reports that during the last twenty years no risk has been paid for death that could be attributed to the use of opium.

A commendable feature which marks the management of the New York hospitals is the Saturday and Sunday collections from the drug, chemical and allied trades. For every dollar's worth of supplies furnished, the donor is entitled to one day of free treatment for himself or any one whom he desires to aid.

Human hair is an important article in the markets of India and China, large quantities being shipped to European countries. A foreign medical journal says this traffic is the cause of the introduction of many diseases, as it is cut from the heads of persons after death in China, and disinfection cannot be relied upon to kill all the disease germs.

The apparent incongruity which exists in associating pharmacy with gold or silver mines is entirely dissipated by the owners of a gold mine at Cripple Creek, Colorado, who have named their property the "Pharmacist." The name does not appear to be a hindrance to prosperity, as the company owning the mine report that they have paid dividends amounting to \$84,000 since its discovery.

The Czar of Russia has evidently been loafing around the drug stores lately and has become acquainted with the duties and needs of the pharmacist. In order to relieve them from the necessity of holding occasional meetings and resolving that the metric system ought to come into general use, he has quietly issued an ukase that at the beginning of the year this system must be used by all druggists.

T. H. HINCHMAN & SONS.

There are three occasions in the history of a business firm which are of sufficient importance to deserve mention. They are when they start in business; when they go out of business; and when they burn out. Two of these occasions would bring to the notice of our readers in connection with the well-known house of T. H. Hinchman & Sons, one of which is referred to in our news columns, and is an occasion when the sympathy of the trade is bestowed upon one of its honored members, and the other is one which, with its sequence of a successful career, calls for the congratulations of the trade.

The history of this prominent firm of wholesale druggists of Detroit is one which reaches back to a time when the city was considered "out west" and was best known as an important frontier town located on the eastern edge of the great northwest wilderness. Its growth has been coincident with that of the city of its location, and the character of its growth is of a nature which calls forth the same degree of approval which that of the city itself provoked in the mind of its average citizen. The personnel of the firm at present consists of Mr. Theodore H. Hinchman and his three sons, John M. Hinchman, Ford D. C. Hinchman, and Charles C. Hinchman, and the identity of interests which naturally resulted from this relationship has no doubt contributed in a large measure to the success which has distinguished the firm in making for itself a prominent position in the jobbing drug trade of Michigan and neighboring states.

Mr. Theodore H. Hinchman, the senior member of the firm, is the oldest druggist in Detroit and is also, we believe, the oldest in the state. He was born in Morris County, New Jersey, March 6, 1818, and acquired his early education in the public schools of New York.

His first connection with the drug trade was in the capacity of clerk, at the age of 14, in a retail store in New York City, where he remained one year. He then became connected with the wholesale grocery and commission house of John Johnson & Sons, then the largest in the United States, with which he remained four years, mastering in the meantime the methods of conducting wholesale trade as practiced by one of the greatest firms in the business. In 1836 he removed to Detroit and entered the drug and grocery house of Chapin & Owen, a house which had been established by Dr. Marshall Chapin in 1819. In 1842, Dr. Chapin having died, Mr. Hinchman became a partner in the firm, which was known as J. Owen & Co. In 1853 he purchased Mr. Owen's interest and took into partnership his brother, James A. Hinchman, who retired in 1863, at which time John M. Hinchman was admitted to the firm, which then became known as T. H. Hinchman & Son. In 1869 Ford D. Hinchman became a member and the firm name was changed to T. H. Hinchman & Sons. In 1872 Charles C. Hinchman was admitted to the membership, which remains practically the same at the present time, although the active management of the business of the house is now in the hands of John M. Hinchman and Charles C. Hinchman.

Many men who never went hungry for a dinner in their lives worry every day about to-morrow's noonday meal.

A TALK ON VANILLAS.*

By Charles E. Hires.

THE importance and value of the vanilla bean cannot be more correctly estimated than by a brief glance at its position as a factor in the commercial products of this country. To the majority of men the vanilla bean is used as a flavoring extract for ice cream, or to add a delicacy and piquancy to an after dinner dessert; but to the specialist, familiar with its use, it assumes a magnitude that is really astonishing. In the year of 1892, in this country alone there was imported and consumed in the various industries and agencies requiring vanilla over one million dollars' worth of this product, numbering over fifteen million beans, and employing in the operations of raising, picking, curing, packing and shipping, over 35,000 people, constituting in value, in commercial importance, in capital involved, in its production and in the amount of labor required for its development, one of the most important products of this vast and rich country.

The vanilla bean is indigenous to the soil of Mexico. The chief center of its cultivation is the state of Vera Cruz, and the metropolis of the vanilla district is the city of Papantla. After twenty years of active experience in handling vanilla, after a long and careful study of it as an article of commerce, and an intimate acquaintance

with its various uses, and its growing value as an article of import, I became possessed with a desire to see it in its natural state, to ride beneath the forests where it grew, to pluck it by my own hands from its natural branch, to enjoy its sweet and delicious aroma in the land of its birth, and in general to familiarize myself with the growth and preparation of this wonderful product, which is so rapidly growing in favor as one of our nineteenth century luxuries.

Take down your map of Mexico and locate the city of Vera Cruz in the state of Vera Cruz, situated on the western shore of the Bay of Campeche. Go north from Vera Cruz a distance of some three hundred miles to Tuxpan. Equip yourself there with a retinue of mustangs, servants, guide and interpreter, and start to the southwest on a three days' journey, over mountains, through almost impenetrable forests, over dangerous and treacherous morasses, and through tropical jungles, to the city of Papantla, situated about seventy-five miles from the coast, inaccessible by railroad or water, and in the heart of as wild and lawless a country as you would care to visit, and you have reached the heart of the vanilla growing district; only a few hundred miles by actual measurement, but requiring more time, toil, privation and danger than to make a trip to the Orient.

Actuated by the desire before mentioned, I left Philadelphia on the 31st of January, 1893, and after a few days'

railroad travel, arrived at Laredo, on the border of the United States and Mexico. From Laredo, on the Rio Grande, to the city of Monterey it is a distance of 170 miles. After a run of a few hours we stopped in a little town—Salinas—and found ourselves confronting a civilization entirely different from that which we left; here were one-story huts with thatched roof, a door, but no windows; women and children at the doors, and the children half naked. No floor but that of hard dirt, no furniture but a chair and stand with a lamp; a bundle of clothes in one corner, probably used as a bed. Flowers were in bloom, a species of cactus six feet high was growing everywhere, and the Spanish Bayonet, a queer-shaped tree of the Yucca variety, was the one prominent tree in the landscape. My vanilla expedition has now carried me about 2,200 miles from Philadelphia into new and strange surroundings. We find here a singular and instructive commentary upon the silver question that is now agitating the country. I found that in spending money this is one of the best countries in the world—the more I spent the more I had left, owing to the very low price of silver and Mexican finances being based on silver values. The Mexican dollar (or peso) is worth 65 cents, and an American dollar is worth \$1.60. When I bought \$1.50 worth of goods and gave a \$5 note I received \$6.25 in change, and it struck me as one of the most wonderful things in political economy that I had

*Read at a pharmaceutical meeting of the Philadelphia College of Pharmacy, November 21. Contributed to the Era by the author.

ever seen. My next stop was in San Louis Potosi, 300 miles from Monterey, having a population of 60,000, on the way you cross the Tropic of Cancer and pass from the temperate to the torrid zone. Here we come to field after field of the green Century plant. I next visited Toluca, some 300 miles south of San Louis Potosi, and 45 miles north of the City of Mexico—the capital of the government, where I spent nine days. Leaving the City of Mexico I proceeded to Puebla, then to Jalapa, and on to Vera Cruz, taking the Ward's line of steamers up the coast to Tuxpan, where I arrived after a thirty hours' sail. Here a tug came to the mouth of the Tuxpan River and took me off, steaming up the river nine miles to the city of Tuxpan. The city has 10,000 inhabitants, and is composed principally of one-story, limestone, thatched houses. After spending three or four days here getting my outfit together, consisting of four mustangs, servants, guide and interpreter, we started early one Monday morning for the vanilla land. We rode through a dense forest by a bridle path, where we had to go single file, after some thirty miles of hard riding, besides having to ford several rivers, coming to an Indian village on the Casonies River. We stopped about 11 o'clock at a small village composed of thatched bamboo houses, and where we waited until 4 o'clock before proceeding on our journey, and arriving at Casonies in the evening at about twilight. On the Casonies River we saw hundreds of Indian canoes plying up and down this stream with women propelling them. We started early next morning for Papantla, where we arrived at about 9 o'clock at night. This is some thirty-five miles further inland. It is a city of about 12,000 inhabitants, and is composed mostly of one-story, limestone, thatched houses. This is the metropolis of the vanilla growing district, situated in the valley surrounded by high mountains on all sides. This is the county seat. Court was in session when we arrived and it was impossible to get accommodations at the one hotel or any of the boarding houses. The hotel is a one-story building composed of three or four rooms; these were all turned into sleeping rooms at night, and everybody had to sleep together; cots were arranged side by side until there was scarcely room to get around. As the climate here is always warm eating is done mostly out of doors. By the courtesy extended to me through letters of introduction I had, I was taken and well cared for by Mr. Tremari, who is one of the first citizens and the largest curer and shipper of vanillas in Papantla. At last I am at the goal of my journey. In the land of vanillas, in the center of a district from which a large portion of the world's supply of this luxury is derived, and in readiness to transform into a reality the dream of years, and here I ask you to pause with me a moment to scan briefly the history of this strange and popular product, of which little is known to the general student.

When the Spaniards discovered America the custom among the Aztecs of flavoring chocolate with vanilla was already in vogue. The former borrowed the practice from the latter and transmitted it in turn to the other nations of Europe. A few years later this valuable product became an export article, and it

is believed that the first vanilla bean introduced into Spain came from the state of Oaxaca. It is raised in divers parts of the continent, in the Island of Cuba and other Antilles, and in some portions of Africa and Asia as well, and as a rule wherever there is enough heat, moisture and shade, provided the lowest temperature in winter be not lower than 55 degrees Fahrenheit.

At first that which grew wild in the woods was harvested, and the inference is clear that, in proportion to its gradual diminution and increasing consumption it was found necessary to foster its growth, and in this the state of Vera Cruz took the initiative, being the first place known in which the plant was under cultivation in America. Notwithstanding numerous inquiries, I have found it well nigh impossible, even with the aid of tradition, to ascertain the exact time in which the cultivation began; this alone being known, that the period is a remote one. From some of the old archives of Papantla we derive the information that in the year 1760 there were already in existence vanilla forests under cultivation. The state of Vera Cruz has had, and to-day possesses great natural advantages for the production of vanilla, but it is cultivated only in the cantons of Misantla and Papantla. For a number of years Mexico supplied the markets of the world with this product, but of late years the Island of Bourbon and Java have come in competition in European markets to a marked degree.

With this brief history of the origin of vanilla start out with me on a bright, clear morning in the month of February, with the thermometer ranging from 85 to 100 degrees; dressed in thin linen, with a light Panama hat, and mounted upon a mustang, for our first visit to the vanilla fields, located about nine miles from Papantla. The first error that you need to correct is our northern conception of a field. It is not here a carefully tilled, snugly fenced, and finely cultivated tract of land, but a wild, boundless, dense and almost impenetrable forest, with undergrowth so dense and rank that our mustangs must be abandoned at a by path, and we ourselves compelled to stoop almost to a creeping posture to penetrate it. Look at yonder tree—a Mexican cedar—25 feet in height, covered with dark green luxuriant verdure, with a small tapering trunk, a few feet in circumference, and clinging to and apparently growing out of its bark observe that strange looking, clinging vine, in circumference a little larger than an ordinary lead pencil, shooting up into the tree, covering its branches, and running from it into the adjoining trees, and often forming festoons and arbors so dense and thick as to exclude the rays of the sun at noon day. Imagine green pods, from four to ten inches long, covered with dark green and spear-shaped leaves, and hanging pendant from the interlacing branches, and you have a picture of a vanilla vine as I first saw it in its native soil and in its highest state of cultivation. Tree after tree in this vast forest is covered with those luxuriant vines, peeping from which, in all the glory of tropical luxuriance, are countless hundreds of the long, luscious, tapering vanilla bean; in circumference almost equal to a banana and from two to three inches longer; some of a dark green, and others of a bright yellow, and sometimes where they grow most luxuriantly resembling bunches of bananas, apparently growing

upon the native trees of the forests. The remoteness from civilization, the total absence of everything indicating care of the ripening fruit in the wild and unbounded woods made the scene one of the most strange and marvellous upon which the eye ever rested. Vast areas containing hundreds of square miles of contiguous territory in this province are devoted to the growth of this plant, wherever you look and wherever you travel you are confronted with this overhanging vegetation. You behold the primeval forest utilized by the half civilized natives as a natural garden for the growth of this delicious aromatic plant.

The cultivation of the plant consists of cutting away the forests to give it room to grow. The vines are naturally grown direct from cuttings, the same as grape vines, but they are also grown direct from the seeds, and in such cases the fruit is much later than when the vines are planted. The vine is very hardy in its native element, and sometimes takes root even if thrown carelessly on the ground, providing it has shade and moisture. Four or five years after the vine is planted, and sometimes before that period, its base rots for some distance, but before this occurs rootlets form above that portion which is dying, having already grown and descended along the tree to get nourishment from the earth. This circumstance, added to the fact that if a root be severed some distance from the ground it does not die, has given rise to two distinct theories respecting this plant, which I desire here to take the opportunity of correcting. The first theory, which has the support of many reputable scientists, is that the plant is Epiphyte, deriving its sustenance from the atmosphere and being independent of the soil, and the second that it is a parasite, and derives its nourishment chiefly from the trees to which it clings. A careful examination of the plant in its natural forests and a patient study of its habits and characteristics, have convinced me that both of these theories are founded in error, although before my visit to Mexico I confess I had been led to adopt the parasitic theory, upon information from many intelligent growers.

Mr. Fuent told me he had made the experiment of severing the reed two or three feet from the ground, and a few days later two or more tendrils had sprung from the lower end of the vine and gone directly to the earth, thus replacing the lost base. The reed is very juicy, and when deprived of its roots tries to replace them, but this is done at its own expense, taking nothing from the tree, which statement is proven by the fact that if it consumes too much time in its endeavor to reach the soil it withers. Should the tendrils reach the soil before the reed is entirely dried up the latter recovers later; but, if, on the contrary, its strength is not sufficient to accomplish the task of reaching the earth, it gradually withers until it dies. In spite of the facility with which the reed takes root and replaces its base, some die, either because the reed was not fresh and sound or because it was damaged, or by reason of its being in localities where it received too much sun or too much shade.

I found others familiar with the vanilla ground contending that the plant depended for its nourishment and growth upon the sap of a particular tree—the cojundi-

gate—and in support of this theory I was taken to the forest and shown vines growing luxuriantly around the base of this tree, showing great fertility and productiveness, and a high state of health. But upon examination of the facts I found that this tree would grow only upon certain soil, and under certain conditions, where the soil was always moist, and the reason that the vanilla grew so much better on this tree than any other, was because the conditions that so well suited the tree were the very conditions that best suited the vanilla plant, and when speaking of my observations in this direction, they admitted that it might be possible, and when finding in one of the gardens of Papanla, a vine growing upon a dead tree, they could not but confess, that it was perhaps not a parasite. These good people had before proven to me, or assured me in their correspondence, that the plant was a parasite, and it gave me pleasure to correct the error I was then laboring under. After making diligent inquiry about the plant, I had the pleasure of meeting Agopito Fontecilla, who I soon learned was an intelligent man, and who had made a scientific study of the plant, and to whom I am indebted for the greater part of my knowledge of the plant.

Taking the average of the last ten years, the number of beans that has been gathered each crop has been above 15,000,000, with the exception of a small quantity gathered on the southern coast of Vera Cruz, some 100,000. The remainder comes from the cantons of Papanla and Misantla, mostly from Papanla. The prices which it has attained during that time have varied much, ranging from \$2 to \$25 a thousand. According to the data in my possession it averages \$60 to \$70, and produces over \$1,000,000. The smallest unripe vanilla weighs twenty pounds to the thousand, and the largest sixty-five pounds to the thousand, and the average about forty-five to fifty pounds. The average loss of weight in curing is about nine pounds to the thousand. The length of the bean varies as much as its weight, from 4 1/2 to 10 inches; the greater part ranging from 7 to 8 1/2 inches. The plant (Vanilla Planifolia) grows a few yards in length each year, some portions of it clinging to the tree which supports it, and some remaining loose and hanging wavelike. Its thickness is about 3/8 to 1 1/2 inch. It is very juicy, round, and of a green color, knotty at intervals, of alternate leaves, shaped like spears and plump. The flower is yellow, and has a sweet agreeable smell. The plant grows in length only. It does not grow anything like a grape vine, and bears fruit only upon the new portion that grows each year. The thickness of the vanilla bean decreases gradually from two-thirds of the lower portion to the tip. Its shape is almost round, somewhat flattened on one side, curving up to the neck, which generally terminates in an arc. Its circumference varies, measuring when green from two to three inches, the greater part measuring three-fourths of an inch in diameter. It has a thin, smooth cuticle, with two superficial lines on either side. When thoroughly ripe its color varies from dark green to light yellow. Its lower portion is filled with small seeds, and after being treated its thickness is reduced to one-fourth of its original size. It remains black, oily, and has an agreeable perfume.

Around Misantla there are several varieties, which are known as Misantla beans, having thick skins. They are not packed as well and are not considered as valuable as the Papanla curing. These varieties are designated by the natives as Cimarrona, Mestiza and Manza. When cured only an expert can tell the different goods. The wild or Pompoma beans, Segne Xante, sometimes called banana vanilla by the Totonaca Indians, who eat them, are to be found here. This plant differs from the Vanilla Planifolia, in that it is much smaller, with larger leaves and less pointed. The bean is about twice as thick and of a triangular shape somewhat resembling the ordinary banana when insufficiently nourished. It has an agreeable fragrance, resembling that of the anise plant. It is commonly and naturally supposed that the bean grows and thickens until approaching ripeness. It is not so, for after it is two months and a half old it ceases to increase in size. Mr. Tremari said he had made several observations during the past two years, measuring vanilla from different vines, and has found that some after the middle and some after the last half of June have neither grown nor thickened in the least. The vine puts forth many blossoms, but the greater part do not bear, and those attaining full growth fall, or turn yellow and crack prematurely, owing to some disease in the seed, the beans, however, cling to it. This serves as a pretext for some persons to say that in October and November the vanilla bean is ripe and should be out, not bearing in mind that its apparent ripeness arrives from sickness in the plant, as shown by its defective nutrition, it being soft to the touch and lacking the solidity of the ripe bean.

I found that the plants grew best in virgin soil where streams and brooks abound, and where the earth is a little sandy, and the dampness is retained longer than in any other soil; in these places the vines grow luxuriantly and vigorously, and yield large fruit, a most important factor, when one considers how scarce rain is in this section between February and July. Marshy ground is likewise undesirable, as an excess of moisture rots the vine. It is found that plants do best where a little sun light can reach them, and the largest growers have trimmed out the heavy foliage that covers many plants. Yet vines exposed too much to the sun yield little vanilla, and what they do yield, is small; the plants soon get yellow and die in a few years. On the other hand those with heavy foliage never thicken. Their color remain a rich green, and finally sickens. The bean it yields is likewise small, badly nourished, and ripeness is retarded. After setting out the vines if they do well they will commence to bear fruit in about three or four years; the yield increases for four or five years, then begins to decrease. It bears a little vanilla after the tenth year. These vines yield, when fully developed, 85 and some as high as 200, although these latter are very rare. Some vines have branches that bear as much as 12 to 15 beans.

(To be continued.)

The crop of violets in the south of France is so much below the average that local perfume manufacturers are experiencing difficulty in filling their orders.

THE CHILIAN NITRATE INDUSTRY.

The Chilean nitrate deposits have long possessed an interest for scientists, diplomats and syndicates. The first named class have furnished us with a collection of interesting theories as to the causes which produced them. To the second named they have furnished a basis for those expressions of "distinguishing regard" which pass between the representatives of political powers whenever a new revolution has disturbed the question of their ownership, and to the last named they have furnished opportunities for both amassing and losing large fortunes. These nitrate beds are found along the northern coast of Chili, in the provinces of Tarapaca, Antofagasta and Taltal, and are roughly estimated to contain 100,000,000 tons of "caliche," or crude nitrate, extending over one hundred miles north and south, with an average width of two or three miles. Iquique and Pisagua, on the sea coast, are the chief cities of the nitrate district and are connected by rail with the various rich deposits along the coast and in the interior. The deposits are leased to several companies by the Chilean government, which derives a greater part of its income from this source. As with all extensive industries employing large capital, the nitrate has experienced many vicissitudes. The apparent inexhaustibility of the supply, and the instability of government, have served as incentives for the leaseholders to make hay while the sun shone, or to mine as much as possible between the intervals of governmental disturbances, with the result that overproduction and low prices have at times threatened the financial existence of the companies operating the deposits. This of course paved the way for the modern remedy for overproduction—the trust—and the "Combinacion Saliterra," with its allied corporation, the Iodine Combination, have for some time been important factors in the affairs of the industry. Late advices from Chili indicate a change of policy on the part of the authorities which may have an important bearing upon the destiny of the syndicate. The government is hard up and has announced its intention of selling the unoccupied portion of the nitrate beds along the northern coast of the republic and bids will be received at Santiago up to the 15th of next July. This action is likely to prove disastrous to the companies working under leases, as it will tend to increase the output and thus lower prices and increase competition. This condition may be forestalled by a purchase of the unoccupied beds by the combination, but it remains to be seen whether this great corporation can furnish the additional capital necessary for so great an undertaking. The affairs of Chilean nitrate bid fair to become an interesting subject to the financial world during the next six months.

Even that far away region, Mozambique, is beginning to feel the effect of civilization, and the country now has a bad case of "hard times" to deal with. Late advices from the British Consul there report a decided decrease in imports, attributed to heavy imports in excess of the demands of the local market during 1892, and the unsatisfactory crops during the last year.

THE LANOLINE CASE.

The full text is given below of the decision rendered by Justice Romer, of the High Court of Justice, London, on December 16, 1883, in the case of *Itenno Jaffe & Darmstadter Lanolin Fabrik vs. Hichardson & Co.*, the particulars of which action were given in the *Era* of January 1st.

Mr. Justice Romer said: "The patent the subject of this action is one for the manufacture of a product called lanoline from wool-fat. At the date of the patent it was well-known that the wool of sheep contained fatty matters, but at that date, for all purposes of practical utility, these fatty matters were only being extracted and used in the following way: The wool was washed with an alkali, or an alkaline soap and water, so as to extract therefrom all the fatty matters and impurities, which of course remained in the wash liquors, leaving the wool clean. These liquors were often referred to as waste liquors, because the main object of the washing was to clean the wool, and not to utilize the fats or impurities removed in the process. But at the date of the patent the waste liquors were not entirely wasted, but were utilized in the following way—and this was practically the only way in which they had been utilized for more than a century before that date. Acids were mixed with the liquors in the vessels containing them. The result of this was that the fats went to the top, and could be and were skimmed off and kneaded into a greasy substance. This substance was and is known as commercial wool-fat. It contained many impurities, some of which could be cleaned away more or less by washing, and then it would sometimes be called cleansed commercial wool-fat; but even this contained many impurities; it was darkish in color and liable to turn rancid, and had an unpleasant odor, was a coarse substance, which could only properly be used, and only was used, as a grease for railway wheels, or for treating leather, or for other similar purposes. It could not be, and never was, used as an unguent or ointment, or for any pharmaceutical or medical purpose; and until lanoline was discovered, and put on the market after the invention the subject of this patent, no product of wool-fat was used or had been used for more than a century for pharmacy or for any medical purpose, or appeared or was referred to in any Pharmacopoeia published since 1720. Moreover, the process by which this commercial wool-fat was produced was tedious and expensive and liable to cause obnoxious smells, and was a nuisance to the neighborhood of the factory. Now the product from wool-fat of 'Lanoline,' which was discovered by the patentees, and the manufacture of which was patented, was for all practical purposes a new and very valuable product. Its utility is not in dispute. It is extremely valuable as an unguent or ointment, being almost colorless, inodorous and not liable to turn rancid. It is largely used in pharmacy and can be usefully applied even to the mucous parts of the body. Its sale is very large and increasing, and it now appears in the Pharmacopoeia, and is recognized in pharmacy and medicine as a useful and valuable preparation. Such an invention as this is of great merit, and speaking for myself, I should approach the specification of such an invention with every wish,

as far as I legitimately could, to uphold it, and not if possible to allow it to be invalidated by technicalities. What, then, was the invention which enabled this new product to be made? To appreciate that, it is necessary for me to state shortly some of the properties of the wool in its uncleaned state and its products. It contains, besides impurities of various kinds, two fatty matters—namely, fatty acids in various forms, which when mixed with an alkali form a soap, and cholesterolin fats, which are practically not capable of being turned into soap by alkali. So that when the wool is washed with an alkali or alkaline soap, the liquor contains, (1) cholesterolin fats, (2) soap, and (3) impurities, and these three constituents differ in specific gravity, the cholesterolin being the lightest. If to this liquor acids are added in the way adopted before the patent, the result is that the alkali is driven out of the soap, and the fatty acids set free rise to the top together with the cholesterolin fats and some of the impurities, so that the fats skimmed off contain not only the cholesterolin but the fatty acids mixed with impurities, and these go to form the ordinary commercial wool-fat. Now, the fatty acids are the cause of rancidity, and it was chiefly due to their presence in the commercial wool-fat that it had the defects I have before pointed out, and could be utilized only for the coarse purposes I have mentioned, and not in pharmacy or medicine. If the cholesterolin fats are freed from these fatty acids and other impurities, then a product is obtained which, when kneaded and washed, is found to have a great capacity for taking up water, and to have the highly useful qualities I have before referred to under its name of lanoline. Now, the above properties of wool and its different constituents were for the first time fully ascertained and discovered by the inventors of the patented invention, and what they patented was the way by which (availing themselves of the properties they had discovered) the cholesterolin could be separated from the fatty acids and the impurities, and be worked up so as to make the lanoline. That way is seen to be a very simple one when once discovered and set forth; but with this as with many other inventions of the highest importance, it does not follow that because it appears simple when discovered and explained, it was obvious before, or did not require invention, or is not of great merit, or the proper subject of a patent. The contrary is the case here. Though many had previously sought a process whereby a better product might be obtained from wool washings than the commercial wool-fat, no such process had, up to the date of this patent, been ascertained, and I gather that the inventors only discovered the new process after a long course of investigation and experiment. The new process stated shortly is this: Take the liquor (or lye as it is sometimes called) coming from the wool washings by alkali or alkaline soap. Refrain from acidulating it—that is, take the fresh undecomposed lye—and bearing in mind that the three ingredients, (1) cholesterolin fats, (2) soap, and (3) impurities, are of different specific gravity, separate them mechanically by the well-known, best and quickest method, that is by a centrifugal machine. Take the light cholesterolin fats or raw lanoline so separated, and knead

it in cold water. Further purification can be applied by putting it in hot water (so separating the fat) and then putting the fat matter again through the centrifugal machine, or dissolving the fat by a solvent and separating the solution by any of the well-known means. And the fat so cleaned is then again kneaded with water, and the product lanoline is obtained. The specification also points out that you can obtain the product from commercial wool-fat by treating the latter with an alkali so as to obtain a milky fluid which is equivalent to the fresh undecomposed lye, and can be treated accordingly. Now from what I have stated it is clear that no objection could be properly made to this patent, either on the ground that the invention patented was not useful, or on the ground that it was not new or not good subject matter. What additional facts, then, have the defendants to rely upon to support an objection on any of the above grounds? Substantially nothing but this: It appears that the Greeks were aware, and Dioscorides pointed out, that from wool could be obtained (by washing it in hot water) some of the grease, and that if this grease were collected and washed repeatedly in water, a substance called 'oesypus' could be obtained, which was useful in certain cases as an unguent. But so far as the process can be ascertained from the known editions of Dioscorides or the treatises of persons acquainted with his writings, or with this oesypus, it is clear that it could not produce lanoline. Nor would any person acquainted with such process as described have been naturally led to discover lanoline. For, amongst other reasons, not a word was said in the descriptions of the process about any alkali being used, and from what I have stated above it is clear that without it no lanoline could be produced. Washings in water, if repeated often enough, will remove some of the more soluble fatty acids, but will not remove all, some of these fatty acids not being soluble in water. And, indeed, from the description of this oesypus set forth in the published works on the subject put in evidence by the defendants, it appears to me it had not the properties of lanoline. In addition, oesypus was practically unknown as a product for many years before this patent, and when, in fact, it was last used no one knows. It was last referred to in any Pharmacopoeia in 1720. Doubtless it was cast aside because not practically useful. Some experts for the defendants say now that they have produced a more or less satisfactory ointment by following Dioscorides' directions; but Professor Atfield stated that he only learned how to work Dioscorides' process gradually, and by the aid of three or four experiments, from which one can well infer what would have happened to any persons less skilled than he, if they had tried to make a product like lanoline merely from what Dioscorides had taught. All I need to say in conclusion on this part of the case is, that if any person can produce a useful article by merely following the directions of Dioscorides he is at liberty to do so, notwithstanding the patent; but I doubt if he can do so; and certainly it cannot be said that those directions are an anticipation of this patent or deprive the inventors of the merits of their invention, or prevent the court from saying that

the invention was new and good subject-matter for a patent and of great value. This disposes of all substantial objections to the patent. As is not unusual in patent cases, numerous objections were taken of a technical and petty description, which greatly increased the expense of the action and the time required to decide it, and yet when threshed out were found of no avail. All these were abandoned except one, which I must briefly notice. It is a typical instance. As one of the alternative processes for further purification of raw lanoline referred to in the specification, is dissolution by a solvent, and amongst other solvents mentioned, is methylated spirit. The defendants lay hold of this, and say it is not a useful solvent for, though it may dissolve impurities, and so be useful as a purifier, it does not dissolve, except with difficulty, the pure cholesterolin fats, and they say that according to the strict wording of the specification a person would gather that all the raw lanoline is intended to be dissolved. But in the first place, I am satisfied on the evidence that the persons to whom the specification is addressed would readily gather from it that such solvent referred to is to be used as a purifier according to its known properties, and would not imagine that in every case it was essential to dissolve the whole of the raw lanoline. In the second place, the defendants' witnesses on the subject appear never to have tried methylated spirit on raw lanoline, and on the evidence as a whole, I am satisfied that it can be used usefully on occasions as a solvent purifier on raw lanoline, though it may not be always so efficacious as some of the other solvents mentioned in the specification. The result is I hold the patent to be good. The only remaining question is as to infringement, bearing in mind that the patent is a claim for the making of lanoline, and does not separately claim the product itself. Now, admittedly, what the defendants are selling under the name of anaspaline is (putting aside an immaterial ingredient) merely lanoline. The question is, how is it made? Treating, as I am entitled to do for this purpose, the defendants and the manufacturers, from whom they buy their unfinished products as one person, the defendants' process of manufacture may be shortly stated thus: They adopt in substance the whole process of the patent, the only difference in the form of the process being that instead of mechanically separating the fresh undecomposed lye procured by alkali-washing by the centrifugal machine, they separate it mechanically by letting the lye rest in a vessel, so that the lighter portion, being the cholesterolin fat, goes to the top, and then they skim that off and work it. Does this enable the defendants to say that they have not infringed the patent? I think not. They appear to me to have taken the essence, or what is sometimes called the pith and marrow, of the invention. The use of the centrifugal machine was not of the essence of the patented invention. The machine was a well known method of separating, mechanically, materials of different specific gravity, and was to my mind referred to in the specification as being, and because it was, the most speedy and efficient known means for effecting the separation. The mechanical separation by allowing gravity to act on

such materials when deposited in a vessel in the ordinary way is a well-known equivalent, though not so speedy or efficacious, and the defendants cannot by adopting this, when they on all essential matters take the plaintiffs' invention, be heard to say that they are not using the invention or infringing the patent. It follows that the plaintiffs are entitled to the usual relief against the defendants as infringers."

WHERE OUR DRUGS COME FROM.

"Principal exports to the United States" is the title of a pamphlet lately issued by the State Department, which is of especial interest from the fact that it gives the value of our imports, and the names of the products, and the countries from which they are derived. The report is compiled from the reports of the various consuls of this country, and the figures bearing upon the extent of the drug and chemical imports are interesting both on account of the magnitude of the commercial interests involved in the trade, and the fact that they show that the most remote portions of the earth are called upon to supply our demand for drugs and medicines. The figures given, with a few exceptions, cover the calendar year 1892, and the report is arranged to show the value of goods as "declared for export" in the various consular districts. From the Buda-Pesth and Vienna districts of Austria-Hungary we receive drugs and chemicals amounting to \$122,758. From Trieste, insect powder and flowers amounting to \$71,884. From France our imports included olive oil, drugs, chemicals, argol, dye stuffs, toilet articles and perfumery and amounted to \$2,564,000.

Germany furnished us with drugs, chemicals, dyes, colors and essential oils to the amount of \$9,193,819. Greece sent us \$21,108 worth of sponges. From Italy we received olive oil, brimstone, canary seed, crude glycerine, soap, argols, orris root, almonds, licorice, sumac and essential oils valued at \$1,909,704. The Netherlands sent us cacao butter, drugs and dyestuffs amounting to \$366,470. Corkwood came \$1,069,057 and argols worth \$131,805 each from Portugal. The Batoum district, Russia, furnished us licorice root valued at \$624,363. Spain furnished us cream of tartar, glycerine, licorice, saffron, corkwood, olive oil and canary seed worth \$1,506,505. Sweden and Norway sent us \$82,055 worth of cod liver oil and oxalic acid worth \$18,090. Little Switzerland sent us anilines, dyestuffs and chemicals worth \$439,518 and enough argols and beef extract to make the total \$475,760. We received from Turkey in Europe, opium, \$403,013; attar of roses, \$11,923; gum tragacanth, \$55,620. From the United Kingdom, which seems to be a sort of clearing house for the world, we received drugs and chemicals amounting to \$12,570,180. British North America sent us \$22,003 worth of senega root and \$12,664 worth of sulphur. Sarsaparilla worth \$67,577, vanilla, \$710,580; fustic, \$130,913; gum chicle, \$75,965, and silver dollars, which are apparently a drug on the market, to the amount of \$454,031 came to us from Mexico. China furnished cassia, \$164,497; gail nuts, \$5,730, and rhubarb, \$16,454. Dutch India, gum damar, \$64,729; gum copal, \$30,452; cassia, \$26,538. Japan, sulphur, \$226,025; menthol, \$23,391; camphor, \$522,152. Philippine Islands, indigo, \$16,369;

ylang ylang oil, \$10,002. Turkey, in Asia, licorice root, \$1,023,710; opium, \$461,431. New Zealand, kauri gum, \$1,397,607. Tahiti (Society Islands), vanilla, \$36,688. Honduras, sarsaparilla, \$30,951; chicle, \$4,604. Brazil, copalba, \$28,955; guarana, \$8,078; castor beans, \$22,674. Chili, nitrate of soda, \$2,850,643; iodine, \$579,213. Peru, coca leaves and elixir, \$5,329. British West Indies, sponges, \$236,555; dyewoods, \$186,844; ginger, \$40,734; pimento, \$126,400. Dutch West Indies (Curacao), aloes, \$3,047. Gaudeloupe, vanilla, \$1,660. San Domingo, dyewoods, \$38,307. Porto Rico, bay rum and oil, \$3,494. Canary islands, cochineal, \$17,382; almonds, \$3,877. British Africa, argols, \$10,088; palm oil, \$1,892. Egypt, sena, \$36,627. Algiers, corkwood, \$22,159. Morocco, canary, cumin and coriander seeds, \$4,735. Zanzibar, cloves, \$289,688; clove stems, \$4,058; gum copal, \$51,836. British Asia, Aden, civet, \$4,898. Calcutta, drugs, \$4,272,076; saltpeper, \$518,545. Ceylon, coconut oil, \$937,331; cinchona, \$73,185; essential oils, \$73,015. Hong Kong, opium, prepared, \$543,091; cassia, \$70,170; medicines, \$51,418. Singapore, gambier, \$733,855; gum copal, \$119,493.

Some business men spend their time fooling over trifles that a cheap boy should be employed to attend to, and then they complain about hard times and dullness.

Now that the grip of the official photographer has relaxed, the World's Fair grounds are a favorite field for the photographer. The buildings are practically as good as ever for photographic purposes.

TRADE NOTES.

EASTER DYES.

These may be obtained of the following firms, all of whom have advertisements in this issue:

O. A. OHLE, Tiffin, Ohio,
PAAS DYE CO., Newark, N. J.

Antikamnia is now so well established as a favorite remedy with the medical profession that the retail druggist should be prepared for all demands for it which may be made upon him. The Antikamnia Chemical Co., St. Louis, desire that the retail druggist should have the benefit of the sales of this preparation and have placed it in the hands of the jobbers to facilitate its easy distribution.

Glenn's Sulphur Soap was one of the first articles of its kind introduced for the purpose of exhibiting sulphur in an agreeable manner for skin diseases. It is still on the market. It is well advertised and is still popular. The demand is steady and it should be kept in stock. The Charles N. Crittenton Co., 315 Fulton street, New York, are the wholesale distributors, and applications to them for advertising material will receive prompt attention.

The physicians of this country as a rule, are already quite well posted on the merits of Panopepton, the bread and beef peptone, manufactured by Fairchild Bros. & Foster, New York. They naturally look to the drug trade to supply their demands. Do you keep it in stock? Panopepton is made of the entire edible substance of prime lean beef and best wheat flour, thoroughly cooked, sterilised and concentrated, and is an excellent food in all cases where a quickly assimilable and comprehensive nutriment is required.

It is related by historians that during the middle ages there were no flies observed during the summer season in certain portions of Europe, and they also record the fact that these localities were devastated by the plague. Sanitary science has reached such a stage that we now have little fear of the dreaded plague, and have no reason to fear a decrease in the usual crop of flies. Henry W. Stecher, of Cleveland, O., says that the proper thing to do with flies is to "stick 'em" with his well-known brand of fly paper of that name. It is not too early to begin to figure on getting the best of this useful commodity—we are sure to have flies next summer.

The following letter to the trade is of interest in showing the personnel of the new firm, George Lueders & Co.:

218 Pearl St., New York, Jan. 2, '94.
I beg to inform you that I have this date admitted as partners, Mr. Ferdinand Weber and Mr. Henry J. Helster, and that from this date my firm name will be George Lueders & Co. I desire to thank my customers for the confidence and patronage shown to me ever since I have been established, and to which alone I owe the present extension of my business. I hope they will continue to honor the new firm with the same confidence, which will be appreciated as highly as heretofore.

Yours faithfully,

GEORGE LUEDERS.

The branch house at 90 Lake St., Chicago, will be under the management of Mr. Henry J. Helster.

The standard household remedies of Dr. D. Jayne & Son, Philadelphia, have been so long upon the market that no discussion of their merits is necessary, as the public has already expressed a favorable opinion. All the druggist has to do is to keep them in stock, the public does the rest. Jayne's Medical Almanac is a great favorite with the people. Have you got a supply for 1894?

The druggist has enough to worry about these days without putting up with the bother and trouble which attends the use of the old-fashioned methods of handling wrapping paper. The American Roll Paper Co., of St. Louis, manufacture the Economic Hopking Roll Paper Cutter, which is both a labor and a money saver. It saves paper by keeping it from being wasted, and saves trouble by keeping the paper where it can always be found. If you do not know all about this handy appliance, write for particulars, or ask your jobber about it.

How to keep brushes so that they could be easily inspected and not show too much the effects of handling and shop-wear has long been a question for the druggist who can only give a limited amount of room for this desirable side line. The question is answered by the Graves Brush Rack Co., of Rome, N. Y., by calling attention to their improved brush rack, a contrivance which allows the display of 10 dozen brushes in a small counter space 19x32 inches. The employment of this appliance means larger sales, less time, more profit and the satisfaction of customers. Its merits should be investigated.

Silurian Spring Water is now so universally recognized by the medical profession as being peculiarly suited for the treatment of many diseases not amenable to ordinary remedies, that it deserves some attention from the drug trade. The druggist can easily supply this demand by giving the matter proper attention and by co-operating with the physician can easily extend his trade in this now well-known medicinal agent. The Silurian products include still Silurian, effervescent Silurian, Silurian ginger ale, wild cherry phosphate, Silurian tonic and Silurian Vichy. Address the Silurian Mineral Spring Co., Waukesha, Wis., for information and prices.

FORMALIN.

"Formalin" is the name which has been given by the Chemische Fabrik auf Actien vorm. E. Schering, Berlin, Germany, to a 40 per cent solution of formaldehyd in water, which they were the first to place upon the market as an ideal germicide, disinfectant, deodorant and antizymotic, possessing the same germicidal power as corrosive sublimate without its toxicity. Formalin has given excellent results in the hands of eminent medical practitioners in diseases of the respiratory organs, ophthalmic practice, and general disinfection. This product is furnished in three forms, Formalin proper, a 40 per cent solution of formaldehyd in water, Formalin tablets of kaolin siliceous earth, containing 50 per cent of Formalin, and a dusting powder containing 20 per cent of Formalin. Schering & Glatz, 55 Maiden Lane, New York, are sole agents for the United States and will be pleased to furnish pharmacists full information regarding this product.

"Klinol," the new antipyretic and analgesic, has already established a demand for itself through the samples which have been lately sent out to the medical profession. The trade or profession applying for samples will be promptly supplied. It is put up in one ounce vials, and its price to the trade is 50 cents per ounce. Address all correspondence to The Klinol Co., Cleveland, O.

Headache remedies are so plentiful that the public must have a hard time remembering their names. With the case of Flag Salt the name itself attracts attention. The Flag Salt Itemedy Co., Savannah, N. Y., use the sample plan in introducing their goods, and send 1 dozen 2¢ cent boxes, 1 dozen 10 cent packages and 50 samples, charges paid, for \$2. The net return on this transaction is \$1.20. Send for free sample box and investigate the remedy.

FOOTE & JENKS TO THE FRONT WITH A BRIGHT NEW CARTON.

Beginning with the new year, we have arranged to supply a handsome new carton for our No. 608 bulk bottle for our Triple Extracts, so as to make them a much more desirable package for handling, either by jobbers or retailers.

The cordial reception given our 8 oz. perfumes in style No. 608 has induced us to continue to sell all regular Standard F. & J. Perfumes in the following list of odors, put up in half pint bottles at \$3 per pint:

	Per bot.
White Rose	\$1.50
White Heliotrope	1.50
Heliotrope	1.50
White Lilac	1.50
Purple Lilac	1.50
Lilly of the Valley.....	1.50
Jockey Club.....	1.50
Carnation Pink.....	1.50
Apple Blossom.....	1.50
Ylang Ylang, etc.....	1.50
Crab Apple Blossom.....	1.50
Golden Rod.....	1.50
Trailing Arbutus.....	1.50

Physian Bouquet (registered).....	\$1.75
Santa Maria (registered).....	\$1.75
Eastern Star (registered).....	\$1.75
Violet.....	1.75
Black Pansy.....	1.75
Extra Tonquin Musk.....	\$2.50
Extra Frangipanni.....	\$2.50

FOOTE & JENKS,
Perfumers,
Jackson, Mich.

No. 608, 8 Oz.

The Eagle White Lead Co., of Cincinnati, O., is an independent company and will quote prices on white lead (old Dutch process), red lead and litharge which will interest the drug trade. Write them before buying your supplies for the coming season.

Dr. Hoxie's Certain Croup Cure is a preventive as well as a cure for congestion and inflammatory conditions of the throat and lungs, and is a good seller because it tastes pleasant, does not contain opium, and does not nauseate. To introduce it a baker's dozen will be sent, express prepaid, for \$3.63, cash with order. As it retails for 50 cents, this price allows a good margin of profit. Address A. P. Hoxie, Buffalo, N. Y.

The peculiar construction of the "Knap" Ladies' Syringe makes this instrument one of the best upon the market. It is sold at prices which are justified by the excellence of its manufacture, and due regard is paid to the interests of the druggist by the quotation of prices which afford him a good profit. The good points of this article are worthy of consideration. Write to the Chicago Medical Specialty House, 358 Dearborn street, Chicago, for descriptive circulars.

One of the most important requirements for a soda fountain is absolute safety. This important feature is supplied by the Iron Clad Mfg. Co., of 22 Cliff street, New York. Their fountains are made of steel, rolled expressly for the purpose, and are lined with pure sheet block tin, insuring absolute protection from contamination. The security of the joints in these fountains does not depend upon solder alone, but they are all strongly riveted, and a malleable iron truss bottom also securely riveted, is an additional security against accidents.

The J. Hungerford Smith Co., of Rochester, N. Y., are going into the chewing gum business and have commenced the year by putting upon the market two brands, "Smith's True Fruit Kof-Kure" and "Smith's True Fruit Pepsin." Both brands have ingredients which will make them sellers on account of their medicinal virtues. They are put up in tablets wrapped in tin foil and enclosed in attractive pasteboard boxes. For the trade, both brands will be packed in boxes fitted with a glass cover and have an alarm bell which rings every time the cover is lifted. The latter arrangement will act as a discouragement to those people who are in the habit of getting their chewing gum for nothing.

The new catalogue of Powers & Weightman, manufacturing chemists, Philadelphia, is an entirely new publication, arranged to conform with the requirements of the U. S. P. 1890. The catalogue shows the wide range of chemicals which this firm manufactures and is embellished with half-tone cuts of the offices and laboratory at Ninth and Parrish Sts., Philadelphia, the immense laboratories at East Falls, of Schuykill, and the firm's office and storehouse at 56 Maiden Lane, New York. There is also included, as an appendix, an extract from the World's Fair letter to the Pharmaceutical Era, August 15, 1893, which gives a description of the firm's exhibit at Chicago, and much interesting information regarding the history of this great manufacturing establishment.

Satisfaction and reasonable prices are two features which distinguish Wampole's Beef, Wine and Iron. The former is due to the care used in the selection of material and its working up into the finished product; the latter are due to the fact that it is made in large quantities and the raw material is purchased in large lots. As to quality, samples will be cheerfully furnished for testing or comparison with the product of other manufacturers. Address Henry K. Wampole & Co., 411 Green street, Philadelphia, Pa.

The J. Elwood Lee Co., of Conshohocken, Pa., was favored by receiving five award medals at the Columbian Exposition for the following articles of their manufacture: (1) Flexible woven catheters and bougies. (2) Antiseptic gauze in glass box jars. (3) Surgeon's ligatures and braided and twisted silk. (4) Lee's metallic splints. (5) Hospital supplies. Their exhibit at the World's Fair was highly commended by all who saw it, and their price list dated January 1, 1894, shows a fine half-tone illustration of the exhibit. This price list shows many new goods and reduced prices, and should be in the hands of every druggist.

ART AND UTILITY.

The Low Art Tile Co., of 952 Broadway, Chelsea, Mass., have been in the business of making art tiles for thirty years, and specimens of their work may be found in some of the finest buildings and private residences in this country. The use of this material in soda fountain construction was simply a happy thought. It was simply the application of artistic ideas, which the public had already been educated to regard with favor, in a new channel, and after four years' experience the Low Art Tile Co. have abundant evidence, as shown by their many sales, that their work is highly appreciated by the soda water drinking public. To the dealer they guarantee the greatest economy in the use of the materials which he must handle in dispensing this popular drink, and they ask all intending purchasers as a matter of justice to themselves to obtain their prices before purchasing.

TO THE TRADE.

We want every druggist to know that we are one of the largest wholesale distributors of Rye, Bourbon and Malt Whiskies in bond and tax paid, in this country. We can furnish Eastern and Western Ryes, Sour Mash and Sweet Mash Bourbon and Malt Whiskies. We can supply fine blended whiskey under our own trade mark, as well as straight Ryes and Bourbons of our own bottling. We are agents for the product of Sen. Stanford's celebrated "Vina" ranch, whose wines and brandies are not excelled in this country.

We are headquarters for Alcohol and Cologne Spirits, which we supply at the lowest market quotations, and in addition to these staples we are agents for most of the celebrated cordials, such as Creme de Menthe, Kuemmel, Maraschino, and we carry in stock many others. A postal card from you will bring a printed list of the goods we carry, and we are pleased at all times to answer any inquiries from druggists regarding our goods.

THE WEIDEMAN CO.,

53, 55, 57 and 59 Water st.,
Cleveland, Ohio.

FROM RANCH TO TABLE.

The Cudahy Pharmaceutical Co., of South Omaha, Neb., evidently believe that hard times, with unemployed workmen and dull business can be remedied by making prices to suit such conditions. They recognize the great fact that people want goods just as much as ever they did and will buy as much as limited means will allow. They have made a general reduction in prices of pepsin and pancreatine. A one ounce bottle of Cudahy's Rex Brand Pepsin, 1-3000 U. S. P. 1890, soluble, non-hygroscopic and free from peptone, is now sold to the trade for 60 cents. Pancreatine at the same price, and essences, tablets, glyceroles, etc., at a corresponding reduction. Have you got their illustrated booklet, "From Ranch to Table," a write-up of the cattle industry? If not send for it and mention the Era.

CROWN LAVENDER SALTS.

The waning days of a great century, marked as they invariably are with some eccentric manifestation, have led to their being named as a sort of epoch by the volatile Frenchman, who with voice and shoulders describes them as *fin de siecle*. In this phrase *monsieur* will give his criticism of any unusual occurrence or event of which you may just now tell him, and to him it seems the perfect explanation. If the logic that guides him in this philosophic view be a little intricate, it is safe in this case, at least, to accept it for it is as good as can be gotten.

But when it comes to a close consideration of these manifestations of the *fin de siecle* period, it is a little better perhaps to cross the channel and take the expression, significant and conclusive, of our English cousins, which calls them "fads." As fads, humankind has lately lent itself to every conceivable vagary that the mind of man can conceive, or his concerted adoption save from being absolutely silly.

Occasionally, however, a fad crops out that is not altogether nonsensical, and is sometimes even decidedly useful. Such a one was on exhibition at Tiffany's the other day, and as the fad is invariably under the wing of Dame Fashion, this one is sure to have a large popularity.

In itself it consists of nothing more than a handsome cut glass jar closed with a massive silver lid handsomely chased and designed, the whole only about double the size of a good library inkstand. But the young man who started to buy one for his sweetheart as a handsome pickle jar, would find himself at fault. The jar has other uses—hence the fad.

Since the Crown Perfumery Company, of London, first brought out its now famous Lavender Salts, the entire feminine world has come to look upon them not so much as a luxury as they are a luxurious necessity. Apart from their use in the boudoir, the exquisite perfume which these salts give off when opened in a room has brought them prominently forward as atmospheric perfumers. It is in recognition of this use that the jewelers have constructed the jars before mentioned, and no society woman now but has one of them filled with the delicately tinted salts on her drawing room table. This is by no means, however, an exclusively American fad, as we learn that the great jewelry houses of Paris and London also have the Lavender Salts jars, and that they are immensely popular over there.

The Thurmond Chemical Co. has been organized at Dallas, Tex., to manufacture Thurmond's Catarrh Cure and Blood Syrup.

The famous Swan Gin of Medler & Zoon, first put upon the market in 1824, has always borne a favorable reputation with the trade for its many excellent qualities. The attention of the drug trade is called to it as a product especially suited to their needs by the advertisement in this issue of Ferd. Ruttmann & Son, New York, who will furnish all information desired as regards quality and prices. This brand is for sale by all the leading dealers.

The Pettit Mfg. Co., Canajoharie, N. Y., are after your trade for 1894. You should be after the trade of your entire neighborhood for 1894. The firm say you can get it by handling Pettit's Extra Fine Chocolates. Their reputation is at stake in this chocolate matter and they are willing to extend liberal assistance in introducing their goods to the public and in giving you a reputation for handling the finest chocolates made. Write them for particulars.

The California Fig Syrup Co., has always recognized the fact that their best interests lay with the legitimate drug trade, and have always heartily supported any movement which had for its object the maintenance of the fixed retail price. This position will be steadily maintained by them, and the preparations they have made for advertising during 1894 is destined to make Syrup of Figs one of the best-selling proprietary articles handled by the retail drug trade.

The Saratoga Victoria Water enjoys a favorable reputation as the "Monarch of Table Waters" and the "Ladies' Favorite." It owes its popularity to its sterling qualities and absolute purity, and it is claimed to have no equal for indigestion and all uric acid troubles. It is sold in bottles only, packed in cases containing 100 pints or 50 quarts. Liberal discounts are given the trade. Write for particulars to Saratoga Victoria Spring, P. O. Box 93, Saratoga Springs, N. Y.

The "Golden Age" champagne manufactured by the HammondSport Wine Co., HammondSport, N. Y., is produced by the natural method of fermentation in the bottle, thereby retaining the carbonic acid gas as nature generates it. Its other eminent health-giving properties make it a most popular brand, and its freedom from excess of alcohol, sugar and acid cause it to be recommended by many physicians as a most effective aid to digestion and a preventive of dyspepsia.

CATARRH.

Hilden & Co., of New Lebanon, N. Y., strongly recommend their well-known preparation, Firwein, as a remedy in the treatment of nasal, post-nasal, pharyngeal and laryngeal catarrh, and feel confident that all sufferers from any of these diseases will thank them for the suggestion. It should be used in these cases by means of the spray or atomizer. It may be used full strength or combined with one of the petroleum oils. While being used locally it should be given internally so as to reach those parts inaccessible to local medication.

Have you noticed the recent change in the advertisement of the A. P. W. Paper Co., Albany, N. Y.? They call attention to the fact that you can now sell roll toilet paper for what it formerly cost you. If you will send for their new catalogue and reduced price list you will find figures that prove this assertion.

The druggist who is desirous of viewing the question of extract of beef from all sides should investigate the merits of the solid and clarified fluid extracts manufactured by Nelson Morris & Co., Chicago. The facilities enjoyed by this firm as one of the largest handling meat products in this country, enables them to give the highest degree of excellence to their goods, and for their meat extracts they claim a distinct superiority, coupled with attractive package and lowest prices.

Aristol, Salophen, Europhen, Phenacetine, Piperazine, Sulfonal, Losophan and Trional form a combination of new remedies with which the physician can successfully combat a wide range of diseases. They are all the product of one firm, the Farbenfabriken vorm. Friedr. Bayer & Co., Elberfeld, Germany, and W. H. Schieffelin & Co., New York, are the sole agents in the United States for these preparations. The literature upon this extensive line of new remedies should be in the hands of every pharmacist, and can be procured by simply addressing this New York firm.

White Rock Lithia Water, put up by the White Rock Mineral Spring Co., Waukesha, Wis., is offered as a pure medicinal water, containing more lithia than any other on the market. The spring flows from a fissure in the solid rock and thus gives a water perfectly free from all traces of organic matter. The present capacity of the bottling works is 10,000 bottles per day, and the water is marketed in cases of 50 quarts, 100 pints, and in barrels. The company has lately perfected a package for shipping water in barrel lots so that it can be kept free from all taste of wood, and remain as pure and sparkling as when it flows from the spring. Write for price list and information regarding the therapeutic properties of this water.

THE WORLD'S FAIR FOR SALE.

LOOK AT IT! The Michigan Central has arranged with one of the best publishing houses in the United States for a beautifully printed series of World's Fair pictures, to be known as the Michigan Central Portfolio of Photographs of the World's Fair.

The original photographs would cost not less than a dollar apiece, but the Michigan Central enables you to get 16 pictures for 10 cents.

It's the finest. It's the most complete.

It's the best. It cannot be beaten.

If you saw the World's Fair, you want it as a perpetual souvenir of a memorable visit.

If you didn't get there you want this to see what you missed, and to fill your mind with the beauty and glory of the White City.

Call on the nearest Michigan Central ticket agent, and he will furnish you with the first part and tell you more about it, or write to O. W. Ruggles, G. P. & T. Co., Chicago, enclosing 10 cts. for the collection.

E. J. Hussey & Co., 80 John street, New York City, have put upon the market the "Tri-mo' Ladies' Syringe, which is destined to become very popular and a quick seller. It is a strictly high grade article and it will pay our readers to investigate its merits.

The drug trade is ever ready to welcome any invention which will obviate the petty annoyances which seem inseparable from the practice of pharmacy. The Josselyn Label Holder seems to be an article of this character, which is entitled to a warm greeting. It does away with mislabeling, prevents mistakes and does away with the trouble of hunting for labels. The holder is cemented to the back of the dispensing bottles and holds fifty labels. The labels are placed with gummed surface out and the heat of the finger coming in contact with the gummed surface, attaches the label to the finger while the customer's bottle is being filled. Write to Josselyn & Co., 19 Wabash ave., Chicago, for full particulars, or enclose 30 cents for sample.

The Wm. S. Merrell Chemical Co., of Cincinnati, O., solicit the patronage of the retail druggist upon a well defined platform which naturally brings the physician and pharmacist together for their mutual advantage. They believe in creating a confidence in the mind of the physician as to the reliability of their goods, and they aim to supply their products to the retailer in original packages for dispensing purposes, so that this confidence may be retained by the prescriber. They therefore discourage sales in bulk as tending to create suspicion in the mind of the physician, but they make prices as low as consistent with best quality, and which investigation shows are often as low as for the same articles as furnished in bulk by other manufacturers.

A LONG FAREWELL TO THE PILL.

The introduction of the Cachet, S. Chapreau, for which Utard & Co., 3 Union Square, New York, are sole agents for the United States and Canada, means a good deal for the advantage of the retail druggist. There are certain objections to pills both from the standpoint of the patient and the physician, and there are also objections when the pharmacist is called upon to prepare them extemporaneously. By the employment of the cachet many of these difficulties are obviated. The apparatus for their fabrication is exceedingly simple and its price is nominal. But a fraction of the time employed in putting up pills is necessary to be employed in putting up powdered drugs in cachet form. The cachets being made of the thinnest possible wafer they do not interfere with the digestion or create disturbance in the most delicate stomach, and their ingenious shape gives them the greatest capacity of any on the market, and also renders them easy to swallow. This form of medication is quite popular among physicians wherever introduced, and pharmacists will do well to write for full particulars and bring the details of the process to the notice of their physicians.

John Lucas & Co., Philadelphia, makes a specialty of varnishes and japans for the drug trade. The quality of the goods and convenience of the packages are recommendations which help to sell them. Remember these facts when preparing to buy for the coming season, and send to John Lucas & Co. for prices.

The druggist who uses Tooth Powder Bottle No. 602, improved, manufactured by John Maris & Co., Philadelphia, is sure to enjoy a good trade in the tooth powder which he puts up. The bottle is constructed with a screw, spring bottom cap, which when removed, leaves the bottle entirely open at the bottom so that it can be filled instantly. A slight touch of the thumb or finger upon the spring bottom ejects the powder from the top on the brush, and none is wasted. Your customers will like this bottle. Sample will be mailed for ten cents.

The customer who tries a free sample of Cooper's Floral Dentine always wants more of it. At least this is the experience of the many druggists who are now handling it, and there is no reason to doubt that this plan of introduction will produce the same result in all cases. It is a great favorite with smokers as its use removes all traces of the tobacco odor. The manufacturers, Cooper & Hardenburgh, Kings-ton, N. Y., send 150 samples with the retailer's name printed thereon, with every order for three dozen accompanied by \$1.50.

The latest offer of Gilpin, Langdon & Co., Baltimore, is along the same line of utility which has characterized the previous offers of this firm. They now offer a set of metric weights and measures to every pharmacist purchasing their powdered drugs for percolation to the amount of \$15. They believe the druggist should make many of the pharmacopoeial preparations and they offer to furnish the necessary apparatus required in following the directions of the U. S. P., 1890. Send for price list, formulary and other matters of interest to every pharmacist.

Whitall, Tatum & Co., of Philadelphia, show something in this issue of the Era which ought to attract the attention of every druggist. The Phenix Herb Cans are an improvement upon the usual style of these containers. They are made of heavy tin, japanned a rich olive green color, with gold lines at top and bottom. The names instead of being painted on the cans are lithographed on strips of metal, and these labels are held in place by neat brass frames, which are detachable, thus allowing the contents of the cans to be changed at pleasure.

C. G. Buck's Mutton Suet, Carbolated, is a preparation that is meeting with great success as a salve for general family use. The curative virtues of mutton suet have long been known, as it occupies a prominent position in the field of domestic remedies. Now that a process for refining it has been successful, its combination with arnica and carbolic acid will undoubtedly extend its use. C. G. Buck, whose laboratory is located at 55 Franklin street, Chicago, also manufactures Benzoin Lotion, a fragrant toilet liniment, Children's Dentifrice, Kilo Cordial, Dr. Barnes' Antiseptic Liniment and Clincoea, nerve tonic. All these preparations are supplied by the leading jobbers.

"The fellow that got behind and went up," is still up, as will be observed by looking at the advertisement of the Hero Fruit Jar Co., in this issue. While satisfying yourself as to this fact observe what they have to say about your putting up your own toilet preparations and using their bottle stoppers, collapsible tubes, etc., and send for samples and prices.

Artists, painters, varnishers, kalsominers and whitewashers have their most exacting demands supplied by the products which emanate from the brush manufactory of John L. Whiting & Son Co., High and Purchase streets, Boston, Mass. The dealer also finds that his desire for a profitable brush trade is supplied by the same line of goods. The drug trade is especially invited to investigate the Whiting brushes.

The firm of the Foote & Jenks, perfumers, Jackson, Mich., passed through the panic of '93 in good strong shape, and have had a large fall trade. As all the salesmen are stockholders, they were at the annual meeting on January 1, and have started out for the year 1894 with prospects of greater success than ever before. The company has greatly enlarged their department of Flavoring Extracts as well as those of Perfumes, Soaps, and Powders.

Bell-Cap-Stic Plasters are well advertised in all the first-class magazines and leading papers, and as a natural consequence they are good sellers. The elegant oleograph "The Puppies" is a great hit, and it is also playing an important part in the advertising of these goods. The special offer on these plasters which will be found in this issue of the Era is worthy of careful attention. All orders should be sent to J. M. Grosvenor & Co., 105 Milk street, Boston, Mass., but the goods will be shipped through the jobbers. Mention the Era when writing.

Cash registers and show cases are necessary appliances in every drug store. From the fact that Shiloh's Family Remedies are good sellers they might be considered in the same category. The connection between these articles may be learned by consulting the advertisement of S. C. Wells & Co., Le Roy, N. Y., in this issue. The prices on these goods are well known, so that the druggist knows the offer of a cash register and show case, free, is not balanced by a deterioration in the quality of the goods. Write for full particulars and mention the Era.

FOREST CITY FARM.

Frank Caton, one of the trainers at the Forest City Stock Farm, Cleveland, and who does most of the veterinary work, says: "We use Quinn's Ointment, and think it is the best remedy we have ever had. I can recommend it every time." This is the universal expression of the leading farmers throughout the United States. For curbs, splints, spavins, windpuffs, and all bunches, Quinn's Ointment has no equal. It will pay all druggists to carry it in stock and if you desire advertising, or will send the names of ten or twelve of your customers who are in the horse breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

Easter Egg Dyes are sure sellers and the druggist who is the first to let the public know that he intends to have a good supply of the well-known Paas Dyes is sure of being remembered when the time comes to buy. The retail sale of these goods is confined to a period of a few days, but the advertising of them should commence weeks before. Write to the Paas Dye Co., Newark, N. J., for circulars.

PHARMACEUTICAL LIQUORS.

There is a logical middle-ground upon which both the pros and cons of the liquor question can consistently meet and join hands. This particular province is strongly dominated by forebearance and common sense and is the position which the profession of pharmacy by its own teaching necessarily occupies. There is, however, no middle-ground when the question of the selection of spirituous liquors for medicinal use comes up for consideration. The United States Pharmacopoeia has announced certain well-defined limits by which these products must be judged, and the pharmacist who allows any deviation from these standards allows a suspicion to attach to all the medicinal agents which he handles. The belief that the pharmacist does not pay as much attention to the quality of the liquors handled by him is not without foundation, and will remain until the pharmacist himself takes the proper steps to remove it. He should be in a position to advise the physician upon the characteristics of the various leading brands upon the market, and his purchases should be made with a view of furnishing articles which will meet the various requirements of medical practice. Assuming the correctness of this position there still remains the question of where to buy. The choice should not be narrowed to one class of manufacture, but should only be made after the advantages of all have been considered. The Weldeman Company, of Cleveland, O., from their position as dealers in all first-class brands, offer to the trade unusual facilities for the proper selection of the best goods. If Eastern or Western Ryes, Sour or Sweet Mash Kentucky Bourbons, or Malt Whiskies are desired, they offer a complete line of all the best brands upon the market. They are importers of foreign brandies, gins, wines, etc., in bulk, or in cases, and are agents for the celebrated cordials, such as Creme de Menthe, Kuemmel, Maraschino, Absinth, etc. The products of Senator Stanford's celebrated ranch "Vina," which have done so much to belighten the reputation of California wines and brandies, are always kept in stock by this house. They are wholesale distributors of alcohol and cologne spirits, and to all druggists who desire to handle the best which the market affords they extend an earnest invitation to test the quality of their goods and avail themselves of the courteous treatment which is a feature of their dealings with all customers. Write them for latest quotations upon their goods, and mention the Era.

How is your stock of Floor Wax? It is best to be always prepared for a demand for this article. It is also a good idea to pay strict attention to its quality. On the latter point W. H. Howdlear & Co., of Boston, will convince every druggist who desires information and will write them on the subject.

Irwin, Kirkland & Co., of Decatur, Ills., are the lending manufacturers of "non-secrets" for the drug trade. Their packages are handsome and medicines of superior quality to the advertised proprietary remedies and only cost one-half as much, thus affording a living profit. It will pay you to write for catalogue at once. Remember the address, Irwin, Kirkland & Co., Decatur, Ills.

As an incentive to druggists to keep their goods in stock, so that every demand may be promptly supplied, the Eureka Chemical Co., 10 and 12 Michigan avenue, Detroit, offer to send to any retail druggist, one dozen Pennyroyal Wafers by express, prepaid, at the regular price of \$3 per dozen, and they agree to wait one year for their pay. These goods are well advertised in all the leading newspapers.

John Phillips & Co., manufacturers of drug fixtures, show cases, etc., Detroit, Mich., have reason to be gratified with the success which their show case called the "Silent Salesman" is now meeting in the way of increasing sales. They give elsewhere in this issue the names of a few druggists who are now using it with great satisfaction. Write for their catalogue and prices. They furnish estimates for fixtures when desired.

The Hazeltine & Perkins Drug Co., of Grand Rapids, Mich., have gotten out an elegant calendar for 1894. It is printed in half tone on twelve sheets of cardboard and the pictorial work includes portraits of the members of the firm, their traveling salesmen, and views of the various departments in their establishment. The calendar is called the Fortieth Anniversary Souvenir and a brief history of the firm since its establishment in 1854 is included.

The D. B. Scully Syrup Co., 49-51 River street, Chicago, present some convincing arguments in this issue of the Era, bearing upon the superior qualities of their Rock Candy and Rock Candy Syrup. The points of excellence to which they call attention are those which every druggist desires to be present in the goods he handles, and the Scully Syrup Co. will be glad to furnish all necessary proof that their goods are just what they represent them to be. Write them for price list and market quotations.

Malt Extract deservedly holds a high place in the estimation of the medical profession, and when a physician obtains good results from a certain brand he is inclined to continue its use. The Royal Malt Extract Co., 1929 Washington avenue, Philadelphia, offer the pharmacist an opportunity to build up a reputation on an extract of malt which will bear his own label. This preparation made by this company gives good satisfaction, pays a good profit and is now used by over 300 druggists in Philadelphia. Write for prices and mention the Era.

"Two excellent articles," is the verdict upon the offer of W. E. Mattern, 1064 Millard avenue, Chicago, who offers one dozen Mattern's Headache Powders at 75 cents per dozen, and includes an Era Dose Book free. Both give satisfaction.

The "Unique" Self-Heating Hair Curler is a new invention lately put on the market by the Unique Novelty Co., 99 Abbott St., Detroit, Mich. It consists of a small metal tube holding alcohol, on the end of which is a lamp burner to which is attached the hair curler. The lamp and curler being in one piece the combined apparatus does not take up any more room than an ordinary curling iron, and its use at evening parties, and as an adjunct to the toilet while traveling is rapidly bringing it into favor with the fair sex.

When it comes to side lines, there is nothing which may better engage the attention of the retail druggist than the Turkish towels and bath robes manufactured by the Star & Crescent Mills, of Philadelphia. If the druggist can successfully handle soap, brushes, etc., for bath purposes, he certainly ought to make a success of these other important adjuncts. An investigation on this point is certainly in order. Write for the little book on Turkish Toweling published by this firm and see if you cannot find a remedy to prevent trade from slipping away.

The shop bottles manufactured by the Daves Manufacturing Co., of Pittsburg, Pa., present many desirable features which indicate a great improvement over the old styles now in use. The recess bottle allows the label to be set so that its outer surface is flush with the bottle, which prevents the breaking and chipping which is so frequent when labels are set upon the outside of the bottle. These bottles are patented and are not made or sold by any other manufacturer in the United States. Samples of the different styles will be sent labeled on receipt of 50 cents.

MELLIN'S FOOD.

The Dolber-Goodale Co., manufacturers of Mellin's Food, showed considerable enterprise by publishing upon the back cover of the Youth's Companion for November 23, 1893, an exact reproduction made from a photograph of the original drawing of the World's Fair diploma received by them for their exhibit of Mellin's Food at Chicago. This food seems to have been in high favor at the World's Fair as it was the only one used in feeding the infants that were left at the Creche in the Children's Building, and was highly recommended by Miss Marjory Hall, the matron in charge.

SOME LARGE FIGURES.

Twenty-seven thousand soda-water apparatus sold in thirty-one years are the figures which Jas. W. Tufts, 33 Bowker street, Boston, has to show for his successful business, which was inaugurated in 1853. Assuming that these fountains average five feet in length, they would, if placed side by side, form a continuous line twenty-five miles long. Less than one hundred were sold in 1863 and over fifteen hundred were sold in 1893. New and attractive designs have been placed upon the market and prices have been so fixed that the prospect for 1894 is better than in any previous year. Write for terms, catalogue, or list of second apparatus and mention the Era.

The wines manufactured by the Crescent Wine Co., of Hammondport, N. Y., are made and put up with great care, and are especially recommended for family and medicinal use. Samples and prices, which are furnished upon application, will convince anyone that for purity, flavor, keeping qualities and reasonable prices, the Crescent wines are equal to the best.

Chas. F. Kade & Co., managers of The Quincy Show Case Works, 216 E. Lake St., Chicago, ask every druggist who is contemplating a change in his fixtures to communicate with them before placing an order. They make a specialty of drug store fixtures and fountain tops, and will be pleased to send estimates and special designs free of charge upon application. Send for their catalogue.

THE LATEST PERFUME.

Foote & Jenks' tribute to the year 1894 is a new odor christened "Eastern Star." It will be put out under special registered label, bearing in neat design the emblematic star of the well-known ladies' order of the Eastern Star. The odor in itself is exceptionally refined and lasting, and is destined to take high rank among the other choice perfumes for which this house is already famous. Write Foote & Jenks, Jackson, Mich., for price and sample.

GOLD WATCHES.

The several liberal offers of McLellan & Patton, 503 Manhattan avenue, New York, as shown by their advertisement in this issue, are worthy of attention. As an introductory measure they offer one dozen Dr. Patton's Headache Specific, free to any druggist who will send them the names and addresses of fifty customers to whom they can mail samples. For orders for one gross they make a present of a silver watch or an Era Formulary, and for two gross orders they give an elegant gold watch.

STYLE 276.

The above is an illustration of the latest Torsion Balance prescription scale put upon the market by the Springer Torsion Balance Co., 92 Read street, New York. The scale is sensitive to 1-30th of a grain and is guaranteed to remain so; a load of 8 ounces on each side would not injure it, thus showing that strength, durability and accuracy have been well combined in its construction. The price has been placed at \$15 for the present, a figure which places it within the reach of all. The triple beam recently put upon the market by this company is growing in favor every day, as it does away with the necessity of purchasing metric weights and gives the equivalents in the three systems at a glance. Send for copy of their latest illustrated catalogue, and report of Franklin Institute upon Torsion Balances.

As an evidence of the popularity of their pharmaceutical machinery, J. H. Day & Co., of Cincinnati, O., lately made extensive shipments to Calgary, Alberta, and Corpus Christi, Mex.

This month "Preston of New Hampshire" calls attention to the "Elvromouth Sachettes." Twenty years is a long time, but it took twenty years' study to perfect the formulas. See advertisement.

An eastern sarsaparilla firm has recently got out writing books containing finely written copy extolling the virtues of their sarsaparilla. The firm offers cash prizes to boys and girls under 15 years of age who send in the best written books.

Careful pharmacists are particular in selecting their corks for prescription work, and manufacturers of proprietary articles are equally fastidious. They will have what they want, and the Williamsburg Cork Co., Brooklyn, N. Y., are ever prepared to furnish them all goods on demand.

If you use homeopathic vials, screw cap, tube or specimen vials, you should correspond with the Standard Flint Glass Works, 1120-1128 Charlotte street, Philadelphia. They also manufacture glass syringes, test tubes, inhalers, pipettes, glass tubing, etc., and can quote prices which will interest the drug trade.

Dr. R. A. Wilson's Anti-Dyspeptic and Headache Pills, which have been on the market over fifty years, are now put up in granule form, in vials, with Turkey red wrappers. They are also put up for the retailer on an attractive show card and wire easel, which aids materially in bringing them to the notice of the public.

Lord, Owen & Co., of Chicago, show some of the leading styles of Whiting's brushes in their advertisement in this issue. The prices quoted call for careful consideration, and the catalogue, which this firm will mail upon application, should be in the hands of every druggist before he selects his stock for the coming season.

Prescription blanks are regarded by many druggists as an item which properly belongs on the loss side of the profit and loss account. If this view is correct, the greatest care should be exercised in selecting the best that can be got for the least money. J. B. Burr & Co., Hartford, Conn., name some prices on this class of work which reduce the expense to a minimum. Send for samples and price list.

With the exception of one factory, the manufacture of quinine, morphine and their salts, and santonin, is confined to the New York Quinine and Chemical Works. They are also the largest makers of aloin, cocaine and acetanilid in the United States, and they call the attention of the drug trade to their products as possessing all the qualities which should belong to reliable remedial preparations. In ordering specify "N. Y. Q."

PLAYING CARDS.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agt., C. B. & Q. R. R., Chicago, Ill.

A cork is a small article, but in pharmaceutical practice the best are none too good. The Lancaster Cork Co., of Lancaster, Pa., have made a specialty of druggists' corks for years and their XXX grade is at the top of the heap.

The prediction that the magnificent architectural features of the Columbian Exposition would forever live in the minds of the people is being verified. The Ferris wheel is now a prominent item in the stock of the show-window artist.

Schoellkopf, Hartford & Maclagan, Limited, of 3 Cedar street, New York, from their position as large importers and manufacturers of drugs and chemicals, are enabled to make exceptional offers, as regard quality and prices, to the drug trade. They call especial attention in this issue to carboic acid, Curacao aloes, Japanese santalwood, ergot, menthol and Australian santalwood oil, and will be pleased to quote prices upon application.

EASTER EGG DYES.

The offer of O. A. Ohl, Tiffin, O., in the Era January 1, to furnish a box of 100 packages of Ohl's Compressed Easter Egg Dye Lozenges for \$2.50, should have also mentioned the fact that 5 per cent discount will be given on all orders sent him to be shipped through jobbers during the month of January. This discount, with the dozen of Indian corn cure offered free, allows the investment of \$2.37 1-2 to bring a net return of \$8. Place your order now and take advantage of the discount.

METHYL SALICYLATE.

A standard remedy for rheumatism, gout and kindred ills for past years has been Oil of Wintergreen, originally obtained by distillation of the leaves of the Gaultheria Procumbens or of what was popularly called the "Chuckerberry plant." This was subsequently superseded by a product obtained by distillation of the bark and twigs of sweet birch, which being cheaper to obtain, practically drove the true oil from leaf out of the market. As both of these products were secured in most cases from farming communities who employed only the crudest sort of apparatus and either through ignorance or indifference exercised no care in its manufacture, their production was characterized by impurities impairing its therapeutic action to a serious extent, and always a source of unreliability and annoyance to the medical profession generally. The dissatisfaction thus created has been allayed of recent years by the appearance of a Synthetic Oil of Wintergreen prepared by the Herf & Frerichs Chemical Co., of St. Louis. The oil manufactured by this firm is a chemically pure Methyl Salicylate prepared in the most skillful manner and containing the same chemical elements and characteristics of the natural oil, but, as previously indicated, in a perfectly pure state. As an artificial product, it naturally met with much skepticism in its earlier history, but repeated experiments rapidly demonstrated its absolute reliability and unvarying efficiency and its undentable merits won immediate recognition. This year it took its proper place in the United States Pharmacopoeia and in writing prescriptions physicians will find it to their advantage to specify the H. & F. brand, while others interested will do well to investigate its comparative advantages.

The advertisement that brings the most returns to the advertiser, says the Atlanta Herald, is the one that, on the face of it, shows that it is an advertisement. It is a notice plainly describing what you are offering to the public. The chances are that those who use these means to reach the public may be wearing diamonds when the man who tries to sneak his advertisement into a description of a sea-serpent swallowing an iceberg will be working the brakes on a gravel train.

YOUR "AD."

Isn't that old advertisement of yours in the local paper, announcing that you deal in "pure drugs, chemicals," etc., and "compound prescriptions carefully," a trifle stale? Haven't the people in your vicinity seen it often enough to become fully acquainted with the facts. Isn't there danger that they will become tired of glancing at this statement regarding your business, which after all means nothing in particular. You paint your store, wash your windows, rearrange your stock, and buy a new suit of clothes occasionally. People notice these little things and nod approvingly. Do you not think a change in that old "ad" of yours would also please them? Let the patent medicine almanacs keep up this style of printing an old-fashioned advertisement for you on the back cover, a style, by the way, which can only attract attention by spelling your name wrong, but when you pay cold cash for having your name in print don't let the impression get abroad that you do not care enough about your advertising to keep it fresh and say something which people will care to read. There is danger that your style of advertising will in a manner become associated with the character of your goods.

RESULTS OF ADVERTISING.

An item from an English journal, the Manufacturing Chemist, is being reprinted in American journals as an argument on the profits of advertising. According to the journal quoted, an individual announced in one of the London daily papers the arrival of a son and heir. He had no idea of the number of friends he possessed and was, therefore, deeply astonished at the congratulations which poured in upon him from various commercial houses, many of them sending him presents as well. He received about a dozen different kinds of soap, a number of samples of infant foods, three bottles of beef extract, a powder puff and seven boxes of violet powder, eight babies' bottles, three elaborate works on "How to bring up your children," specimens of linen and flannel for infants' attire, and advertisements of everything a baby could possibly need. There came, too, proposals from a dozen insurance companies relative to insuring the life of the baby and the whole family at especially advantageous rates, prospectuses from a Californian emigration society, anxious to ship the baby and the rest of the family to California at the lowest rates, circulars from private gentlemen who wanted to lend any sum of money on no security whatever, together with advice and good wishes enough to last a person a hundred years.

MAGAZINES.

The following is a brief mention of the important features of the January magazines:

The Atlantic Monthly is particularly strong in fiction, which includes the opening chapters of Mrs. Deland's new novel "Philip and His Wife;" "The Only Rose," by Sarah Orne Jewett; "Wolfe's Cove," by Mary Hartwell Catherwood, and chapters of "His Vanished Star," by Charles Egbert Craddock. A delightful study of nature is found in "From Winter Solstice to Vernal Equinox," by Edith M. Thomas. "Admiral Earl Howe," by Captain Mahon, throws much light upon the character of a conspicuous figure of our revolutionary war. J. H. Denham contributes an interesting article upon General S. C. Armstrong, of Hampton Institute fame. Literary students will find much of interest in "Letters from Coleridge to Southey," "Talk at a Country House," by Sir Edward Strachey, and "The Transmission of Learning Through the Universities," by Prof. N. S. Shaler.

Outing for January is a holiday number and is a gem of artistic elegance. Its contents are: "The Hammock's Complaint," by Ella Wheeler Wilcox; "A Skating Song," by Charles G. Rogers; "Ivan of the Mask," by Ella Lorraine Dorsey; "A Winter Picnic," by Van Eps; "A Xmas Fox-hunt in Old Virginia," by Alex. Hunter; "Nomads of the North," by C. J. C. Hynes; "Winter Fish-Spearing," by E. W. Sandys; "Following Dickens With a Camera," by H. H. Ragan; "A Winter Regatta in Aztec Land," by Arthur Inkersley; "Crossing the Simpson Pass," by Annetta J. Halliday; "The House on the Lone Tree Meadow," by H. P. Beach; "The Land of Josephine," by W. L. Beasley; "Lenz's World Tour A-wheel," "Sketches from the Nile," and the "National Guard of Pennsylvania," by Capt. C. A. Booth.

The complete novel in Lippincott's is "The Colonel," by Harry Willard French, and Gilbert Parker supplies the opening chapters of a serial story, "The Trespasser," which will run through six numbers of the magazine. James Reeve Knapp in an interesting paper corrects many wrong impressions, and gives much new information regarding "The Peninsula of Lower California." Under the title "A Juvenile Revival," Thomas Chalmers celebrates the "Christian Endeavor Era." Frank Shelley writes of "Early Marriage Questions," Charles Morris of "The Twentieth Century," and in "Talks With the Trade," F. M. B. answers some questions of young writers.

The table of contents of The Popular Science Monthly shows a literary feast which few will desire to miss. The titles are mostly explanatory and are as follows: "The Ethics of Tribal Society," by Prof. E. P. Evans; "Night Hawks and Whelp-poor-wills," by Dr. R. W. Shufeldt; "Recent Railway Disasters," by Lafayette C. Loomis; "Evolution in Professor Huxley," by St. George Mivart; "How the Sea is Sounded," by G. W. Littlehales; "Uncle Sam's Life Savers," by Frank G. Carpenter; "Emotions and Infection," by M. Ch. Fere; "Window Lights and Their Value," by Prof. J. L. Greenleaf; "Speech for Deaf Children," by Lillie E. Warren; "Logical Method in Biology," by Frank Cramer; "Legal Preventives of Alcoholism," by M. J. Berkeron; "Past and Future of Aluminum," by M. J. Fleury; "Elisee Reclus and His Opinions," by Helen Zimmern,

and "Invention and Industry at the South," by Barton H. Wise.

The literary features of The Century admit of a classification which make the number one of great importance. Art is represented by a paper on Franz Hals, the great Dutch painter, by T. Cole. Literature, proper, is represented by "The Function of the Poet," by James Russell Lowell; "George Sand," by Madam Blanc, and "Andrew Lang," by Ibrander Matthews. In the department of music are found, a paper on Schumann by Edvard Grieg, and one on "Indian Songs," by Alice C. Fletcher. "Public Questions" embrace "Military Instruction in Schools and Colleges," by ex-President Harrison; "The Garfield-Conkling Controversy," by ex-Senator Dawes; "The Silver Side of the Question," by C. S. Thomas, of Denver, and "The New Abolition," an editorial denouncing the apollis system. "Pudd'head Wilson," by Mark Twain; "Captain Jerry," by H. S. Edwards; "A No-Account Creole," by Kate Chopin, and "Out of Her Class," by C. B. Davis, are the features of the department of fiction. Sport and adventure are represented by "The Vanishing Moose," by Madison Grant; "A Journey to the Devil's Tower," by Thomas Moran, and "Life in a Lighthouse," "The Bible and the Assyrian Monuments" is the title of a scholarly article by Prof. Jastrow, of the University of Pennsylvania.

St. Nicholas is also a holiday number, and as such it partakes of the character of the season, and is loaded with good things. Rudyard Kipling gives us, from his Indian literary storehouse, a story of "Mowgli's Brothers;" Frank R. Stockton writes of the City of St. Augustine. "How Paper Money is Made," is the title of an interesting article by Clifford Howard, and that upon "Stamp Collecting," by Crawford Capen, is sure to find a large and appreciative audience. Palmer Cox's "Brownies" have always been objects of interest and admiration, and there will be much interest evinced in the article in this number giving the inside history of their development. Other articles of interest are "The Little People from Java," by W. A. Rogers; "How the Secretary of the Treasury Once Played Santa Claus," and the monthly installments of the serials, "Tom Sawyer Abroad," by Mark Twain, and "Toinette's Philip," by Mrs. C. V. Jamieson.

The salient points of the Ladies' Home Journal are woman's connection with the stage, and the education of girls. In the former category is an article by Madame Adelaide Ristori, and one by the well-known dramatic manager, A. M. Palmer. In the latter is a strong article by the editor, Edward W. Bok. The second installment of "Pomona's Travels," by Stockton, is delightfully interesting and William Dean Howells tells of his acquaintance with Don Quixote in "My Literary Passions." "Packing a Trunk Well" is the title of an article by Ruth Ashmore, which will probably be read with absorbing interest, especially by the sterner sex. The four hymns for which prizes were offered last year appear in their entirety in this number. Mothers will be interested in Miss Scovill's "Kindergarten at Home," and the exquisitely designed cover by Wenzel will certainly please the artistically inclined.

The pages of the North American Review are quite appropriately replete with discussions of the questions of the day.

Representative Wilson explains the reasons for the proposed imposition of an income tax on corporations. Ex-Speaker Reed discusses the proposed tariff legislation. Comptroller Eckels gives his ideas upon the prevention of a money famine. Frederick R. Coudert, the well-known lawyer, presents a paper upon the "Hawaiian Question." The Governor of Colorado discusses the effect of recent legislation upon the silver states. Brazilian Minister Mendonca gives an interesting account of the growth of "Republicanism in Brazil." "The Roman Catholic Church and the School Fund" is the title of an article by Bishop Doane, of Albany. The Rev. Dr. Briggs discusses modern biblical criticism in connection with the Sunday school and Prof. Abram S. Isaacs, editor of the Jewish Messenger, contributes an article on the "Glorification of the Jew." Other articles of general interest are, "Is the Value of Our Past Cruisers Overestimated," by Rear-Admiral Ammen, U. S. N.; "Intercollegiate Foot-Ball," by Drs. White and Wood, of the University of Pennsylvania; "Afterthoughts of a Story Teller," by George W. Cable; "Wagner's Influence on Present Lay Composers," by Anton Seidl, and "Diners and Diners," by Lady Jeune.

CONSULAR REPORTS.

The volume of consular reports, issued by the State Department for December, 1893, contains an able article reprinted from "The Revue du Commerce Extérieur," Paris, entitled "How the Government Should Aid Commerce." The writer says: "The first duty of the state to our merchants is to inform them of the condition of foreign markets, of their needs, their usages, the methods employed by the countries that import our products, and, consequently, of the means to be employed by our citizens to open new channels or to extend their relations. This information can be furnished only by consuls, Chambers of Commerce, or by persons charged with a special mission having for its object the study of such and such a country, or such a market." After commenting upon the character of the reports furnished by consuls, and noting their lack of uniformity in methods of preparation and presentation of statistics, a plea is advanced for the establishment of a special service in the ministry of commerce whose duty will be to give immediate answers to inquirers seeking information in relation to foreign trade, or to keep such information in a manner to make it available to the masses.

This agitation of an important subject seems quite pertinent and a similar consideration of the question by the merchants of our own country might result in considerable advantage. It is quite obvious that our consular service enlists the services of many able men, as is shown by the comprehensive reports which are issued by the government each month, and criticisms upon the weak spots in the service certainly come with poor grace from a people who, after paying a good salary to officers of the government for the collection of the information, display a decided indifference when it comes to reading the reports and making use of the information contained in them. There seems to be an impression abroad that the opposing political parties of this country, controlled as they are by different ideas as to legislation concerning commer-

cial affairs, are apt to send as representatives to foreign countries men whose ideas upon trade relations necessarily coincide with those of their party, and that statistics and information furnished by them are likely to be influenced with prejudice or at least colored to further party interests. In fact our consular service is regarded as part of a political machine. We believe there are enough exceptions to this ruling idea to prove the negative side of the question, and that the failure, if any, in our consular service is due to want of appreciation on the part of the public for whose benefit it is maintained. There is one agency in this country which has done more perhaps in utilizing the labors of our foreign representatives than any other, and that is the trade journal. While many of these have for years aided the people by disseminating knowledge of this character the practice is not as universal as it should be, and its further extension would be an undoubted benefit. It is true that these reports are furnished freely by the government, but for some unaccountable reason the average government report is not regarded with favor by the average citizen, and the consular reports as a rule cover a field too diversified to render them interesting to the person who cares for but one subject. The class or trade papers, therefore, seem to be the proper channels for the publication of information bearing upon the particular interests of their subscribers. With this idea in mind the Era would suggest that consuls be instructed to give special attention to matters relating to the drug trade in the countries to which they are sent. Methods of handling indigenous products with descriptions of their manner of cultivation, marketing, extent of production, etc., are always interesting and of decided value. Let papers of other trades pursue a similar course in the way of suggestion, and our reports from foreign countries will begin to pay dividends. And while our various commercial bodies are resolving that a department of commerce would be a desirable addition to our list of government portfolios let them also suggest the establishment in connection therewith of a bureau of information on the plan mentioned by our French friend.

Do not be above your business. He who turns up his nose at his work quarrels with his bread and butter, says the Newsman. He is a poor smith who is afraid of his own spark. There is some discomfort in all trades. If sailors give up going to sea because of the wet, if bakers left off baking bread because it is hot work, if tailors would not make our clothes for fear of pricking their fingers, what a mess we would come to. All trades are good to good traders. Lucifer matches pay well if you sell enough of them. You cannot get honey if you are frightened at bees, nor plant corn if you are afraid of getting mud on your boots. When bars of iron melt under the south wind, when you can dig fields with toothpicks, blow ships with fans, manure crops with lavender water, and grow plum cakes in flower pots, there will be a fine time for dandies; but until the great millennium comes we shall have a great deal to put up with.

Jno. W. Perkins & Co., wholesale druggists of Portland, Me., were damaged by fire recently to the extent of \$3,000. The fire originated in the laboratory.

PATENTS,

TRADE-MARKS AND DESIGNS.

From U. S. Patent Office Gazette.

TRADE MARKS.

- 23,665—Sheep-Dips.—Newton, Chambers & Company, Limited, near Sheffield, England. The word "Noxona."
 23,670—Ointment or Jelly for External Use.—Charles J. Uhl, Chicago, Ill. The representation of a horseshoe, the letters "U. H. L." and the word "Jellyine."
 23,671—Liniment.—Dominique May, New Orleans, La. The representation of three diamond or lozenge cone-shaped figures.
 23,672—Liniment.—James E. Rork, Eau Claire, Wis. The word "Dadger."
 23,673—Remedy for the Cholera.—Stephen Horace McKellips, Antioch, Cal. The representation of a train of cars attached to a locomotive under a full head of steam.
 23,674—Remedies for Cramp, Colic, Cholera and Catarrh.—Lacey E. Peyton, Omaha, Neb. The representation of a horseshoe magnet having electric flashes issuing from its poles and the words "Magnet Pain."
 23,675—Chloride of Sodium or Common Salt.—Thomas Higgin & Company, Liverpool, England. The word "Wind-sor."
 23,680—Extracts of Beef and Pork Products, Including Lard.—Nelson Morris & Co., Chicago, Ill. The representation of three old women in the act of drinking and conversing, and the words "The Talk of the Town."
 23,683—Bonbons.—The Walter M. Lowney Company, Boston. The word "Lowney."
 23,686—Oleaginous Food Substances.—N. K. Fairbank & Company, Chicago, Ill. The representation of the head and neck of a steer or bovine, partly encircled by the branches of the cotton-plant.
 23,688—Cooking-Oil.—Merchants and Planters' Oil Company, Houston, Tex. The words "Diamond Butter Oil."
 23,689—Soda-Water and Other Carbonated Beverages.—Crystal Spring Bottling Company, Barnet, Vt. The representation of a calla and the word "Purity."
 23,700—Tonic.—Joseph Triner, Chicago, Ill. The words "Triner's Bon Camp" and the figure of a shield bearing a monogram of the letters "J. T."
 23,702—Remedies for Cholera Morbus and Similar Diseases.—George S. Bartles, Caribou, Colo. The figure of a star having a ring at each point and inclosing at the center the word "Star."
 23,703—Liniments and Scrap Tinctures.—J. W. Garney & Son, Scranton, Pa. The abbreviation and word "Dr. Galvin's."
 23,704—Vermin Eradicators.—Seymour W. McTaggart, Lancaster, Pa. The word "Lightning," the conventional illustration of a stroke of lightning, and an insect or bug in an attitude as if struck by lightning.
 23,705—Insecticides.—Daniel J. Lambert, Warwick, R. I. The portrait of the registrant and the words "Death to Lice."
 23,706—Insecticide, Disinfectant and Cleansing Liquid.—George H. Smith and Theodore W. Day, South Orange, N. J. The word "Killmquick."
 23,707—Mordants.—The firm of Th. Goldschmidt, Essen-on-the-Ruhr, Germany. The initial letters "T" and "G" arranged in the form of a monogram.
 23,708—Writing paper and Envelopes.—George B. Hurd & Co., New York, N. Y. The words "Highland Heather."
 23,709—Writing Paper and Envelopes.—Worcester Envelope Co., Worcester, Mass. The words "Alba Linen."
 23,714—Remedies for Worms, Coughs, Catarrh and Dyspepsia, and a Liniment.—The C. G. Clark Company, New Haven, Conn. The word "Coe's."
 23,715—Remedy for Diseases of the Liver, for Dropsy, Costiveness and Dyspepsia.—Leopols Gerstle, Chattanooga, Tenn. The words "Saint Joseph's Liver Regulator" and the representation of a female in a slooping position gathering herbs.
 23,716—Medicine for the Cure of Alcoholism.—New England Cure Co., Providence, R. I. The words "New England."
 23,717—Tonic Medicine.—Josiah S. Bailey, Bonham, Tex. The representation of a globe bearing the picture of a young lady's head and shoulders.
 23,718—Cordials.—Gustav Budde, Radevormwald, Germany. The representation of a man wearing a dressing-gown, rising from an arm-chair and having one hand extended to another man who holds aloft a bottle.
 23,719—Natural Spring Water.—Franklin H. Orvis and Sarah M. Orvis, Manchester, Vt. The word-symbol "Equinox."
 23,720—Preparation for Improving the Taste of Coffee.—Otto E. Webber, Radebeul, Germany. The words "Carlsbad Coffee Spice" in connection with the representation of a portion of a globe and the American shield and eagle on said globe.
 23,721—Condensed Milk.—The Norwegian Milk Condensing Company, Limited, Christiania, Norway. The word "Viking."
 23,723—Tooth Paste.—Joseph Spyer, Chicago, Ill. The word "Mexican" arranged within a circle.
 23,724—Cleaning and Polishing Preparations.—Friedrich Adolph Schulze and Gustav Adolph Philipp, Leipsic, Germany. A representation of the globe bearing the lines of latitude and longitude.
 23,734—Nursing Bottles.—Wm. M. Decker, Kingston, N. Y. The word symbol "Hygela."
 23,742—Mineral Water.—Burke Christman, Harrisonburg, Va. The word "Massanetta."
 23,476—Medicinal Whisky for Lung Diseases and Debility.—John F. Broderick, St. Paul, Minn. The representation of a Maltese cross.
 23,747—Preparation for the Hair.—Meta S. Kelso, Stamford, Conn. The representation of a fleur-de-lis.
 23,748—Remedy for Cancers.—Mary A. C. Millen, New York, N. Y. The word "Mirabills."
 23,749—Remedies for Rheumatic, Nervous and Venereal Diseases, and Other Disorders of the Skin and Blood.—Waldo L. Curtiss, Winsted, Conn. A monogram composed of the letters "W L C" placed upon a disk having a serrated border representing a star of many points.
 23,750—Liver Powders.—Lawrence Alexander, St. Augustine, Fla. The letters "C S A."
 23,761—Unfermented Wines.—C. H. Howe & Co., Denver, Colo. The word "Vindone."

THE MARKETS.

New York, January 10, 1894.

A dull, featureless market prevails. The improvement in business which was expected to occur after the first of the year has not been realized, and present predictions now extend the period to the first of February, as it is thought that it will take the jobbers until that time to get their affairs of the past year straightened out. But a good trade in the near future is confidently looked for even by the most conservative, and the argument, oft-repeated during the past three months regarding the depletion of stocks in both wholesale and retail hands, gains force as time passes. Some attribute the dullness to tariff legislation, while others lay it to the absence of good cold weather. The latter reason is undoubtedly an important one, as the business-stimulating effects of cold weather are well known. Lack of business has caused prices to remain without change, and only a few advances are reported.

Opium.—At present writing has advanced a point and the market seems a shade firmer. No business of any moment has been transacted and probably will not be until the see-saw movement in prices ceases. Reports from Constantinople and Smyrna, indicate considerable buying for the American market and in consequence prices there have advanced and the market has taken on a firm tone. This has also had its effect on the London market, where prices have also advanced, but the business is reported light; \$2.25 is the asking price in case lots.

Powdered Opium.—Remains unchanged at \$3.10 to \$3.25.

Quinine.—Business still continues good, the prevalence of "La Grippe" keeping up a good demand. Speculative interest in this article seems to have ceased and supplies are passing only into the hands of dealers or for actual sale. The instability of this product has caused it to be added to the list of articles to be let alone. Prices are without change; 221-2c for foreign, 2c for American in bulk lots.

Alcohol.—Is sought for in small parcels only and in quantities of this kind is in fair demand without change of prices; \$2.24 to \$2.28 being the ruling quotations.

Wood Alcohol.—A reduction of 10c per gallon on the lower grades is reported. Prices are as follows for 5 to 10 barrel lots: 5c per cent, 90c; 97 per cent, 95c. Alcoholene is quoted at \$1.50 per gallon and the demand continues good as there seems to be a disposition on the part of many dealers to sell wood alcohol in place of grain alcohol and many people in consequence are becoming educated in its use, who formerly used the grain for burning purposes.

Ergot.—Is without improvement in demand. Some large purchases and shipments for this port are reported to have been made at Hamburg. German is quoted at 30 to 35c, Spanish 35 to 40c.

Bleaching Powder.—Is only in fair demand. Stocks are very light and the market is a little firmer.

Oxalic Acid.—The firm tone of the market previously reported continues. English in casks is held at 8 to 9c.

Chlorate Potash.—Although the market abroad has advanced, prices here are without change; 14 3/4 to 16 1/2c is asked for kegs.

Borax.—Business at first hands continues good with a fair demand for jobbing

parcels. An advance in prices is looked for but current quotations are without change. California refined in casks is quoted at 8 1/2 to 9c, city refined 9 to 9 1/2c, powdered 8 1/2 to 9c.

Sulcaline.—Prices remain at previously quoted prices, with fair demand.

Chloric Acid.—Is in light demand. Prices remain unchanged.

Cocaine.—Is meeting with fair demand. Prices remain without change.

Menthol.—Is high and scarce. Stocks abroad are also light. Prices are held firm and there are few sellers; \$6.50 to \$8 is asked as to brand and quality.

Caffeine.—Shows a further advance in value and holders are now firm in their demand; \$2.40 to \$2.75 is asked.

Arsenic, White.—Market is very firm and stocks scarce.

Alum.—Is in light demand and orders are for small quantities only. Buyers seem reluctant in placing orders and are looking for a reduction in price; \$1.95 to \$2.15 in original packages is quoted.

Cream of Tartar.—Continues in light demand and seems to be passing out in quantities for immediate use only. Prices are without change; 18 1/2 to 19 1/2c for powdered in casks.

Brimstone.—While no advance in prices has been noted here, prices abroad have advanced and the market is very firm. The stock of seconds is said to be very scarce.

Quicksilver.—Has declined owing to a disagreement among the members of the California Association. As a result of the drop in prices, business has been stimulated and goods are freely offered at 48 to 50c.

Corrosive Sublimate.—Has been reduced owing to the decline in quicksilver; 60 to 65c is asked in jobbing quantities.

Blue Mass.—Has also declined; 69 to 75c is quoted.

Calomel.—Is in fair demand. The reduction in the price of mercury has helped to stimulate business for this article also; 78 to 85c is asked in wholesale quantities.

Red Precipitate.—Is in fair demand at reduced prices; 83 to 87c is quoted; white at 29 to 40c.

Nitrate Silver.—Has been reduced by the manufacturers; 48 to 50c is quoted for jobbing quantities.

Glycerine.—Shows a further decline and is offered at figures that favor buyers; 12 1/2c is quoted in drums, 13 to 15c in barrels, 15 1/2 to 16 1/2c in cans.

Gum Asafoetida and Aloes.—Are without change in prices.

Gum Chicle.—Is without special features of interest and values remain unchanged.

Tar, Barbadoes.—Has declined and is now freely offered at 40 to 45c per gallon in original packages.

Cod Liver Oil.—Shows a light falling off in business. The market is firm and with a revival of business, an advance in prices is looked for. Nominal quotations are \$20 to \$22.50, as to brand.

Castor Oil.—Prices are firm, demand light and ruling values as follows: Pure oil, 15 to 16c in barrels; 16 to 17 1/2c in cases; No. 3, 12 to 12 1/2c in barrels; 12 1/2 to 13 1/2c in cases.

Castoreum.—Scarce and high is the report given; \$3 per pound seems to be the inside quotation.

Castile Soap.—Best grades of white are still somewhat scarce; 10 1/2 to 11 1/2c is asked in round lots; mottled, 6 3/4 to 7 3/4c.

Balsam Copaliba.—Prices continue firm,

but a light business is reported. Stocks continue light with no expected arrivals. Prices remain as previously quoted.

Balsam Fir.—An unusually firm market is reported with a very small available stock on hand and there are few offerings below \$4 in barrels; \$1.25 to \$1.50 is asked by the gallon.

Balsam Peru.—Is dull and featureless without business of importance; \$1.60 is quoted.

Balsam Tolu.—Is without change and business is light for this season of the year. Inquiries are for small parcels only, at 27 to 35c.

Oil Peppermint.—Is without material change. The market is firm and values are well maintained. Previous quotations are without change.

Oil Cassia.—Is only in ordinary demand, quotations ranging from 60c to \$1.05.

Tonka Beans.—Remain firm. Buyers seem to be holding off for lower values, but holders seem unwilling to make concessions and little business is being done. Angostura are quoted at \$2.25 to \$2.50 in jobbing quantities.

Vanilla Beans.—Are high with a very firm market, with indications pointing to higher prices.

Chamomile Flowers.—Are in good demand. Prices remain without change.

Saffron, American.—Shows a slight advance and quotations now range from 40c to 55c; Valencia, \$5.75 to \$5.

Senega Root.—Is without inquiry and is freely offered at 45c to 50c.

Sarsaparilla.—Is in light demand and no change in prices is reported.

Canary Seed.—Continues in firm demand at values previously reported.

In their market report dated January 2, 1894, Morrissin, Plummer & Co., of Chicago, say: "Manufacturers of Acetanilid have reduced their prices and the article is now quite cheap. Balsam Fir, Canada, has advanced, being quite scarce. The new crop is said not to exceed fifty barrels. Since our last issue we have been advised by Powers & Weightman and Mallinckrodt Chemical Works, that they will be unable to furnish any Bismuth Sub-gallate, except the imported article, known as "Dermatol." The process of manufacture now in use is patented. Caffeine has advanced 10 to 15 per cent. Menthol supplies are extremely limited, and prices range from \$5.50 to \$6.75. Oil Lemon is lower and weak. Good Seal is tending upward. Florentine Orris is somewhat higher. Canary seed is firmer, Fennel a trifle lower, flax higher and bemp easier. The brands of all regular corrodors of white lead have been reduced to six cents per pound in 500-pound lots, with 2 per cent discount for cash in fifteen days."

On account of the difficulty in obtaining pure olive oil for table use in Germany, considerable attention is being directed to oils obtained from bechnuts and the seeds of the linden tree as substitutes.

"I believe in trying to put as good a face as possible on everything in times like these, Maria," said Mr. Billus, looking again at the bill that had just been brought in, "but it does seem to me that \$3.75 for complexion wash in one month is putting it on a little too thick!"—Chicago Tribune.

IRA REMSEN.

PROF. Ira Remsen, of Johns Hopkins University, Baltimore, Md., is probably the best known of American chemists in purely theoretical chemistry and advanced organic research. He is the editor and was the founder of the American Chemical Journal, which is to the chemical fraternity in this country what the *Berichte d. d. chem. Gesellschaft* is to the scientists of the old world. For this publication he has written many scientific papers to record the results of personal investigations in both applied and theoretical chemistry. He is of greater fame as an author of several books, the product of his pen, which have won high standing. His "Principles of Theoretical Chemistry" is of special note for having gained the approval of the entire chemical world. It is a standard text

book in many institutions, and has undergone translation into several languages. Enumeration of but the more important of his contributions to chemical literature would require more space than is at disposal. Prof. Remsen is purely an American product. He was born in 1846 in New York City, and, with the exception of a few years in his boyhood spent in the country, he gained his education in the schools of that city. He is a graduate from the College of the City of New York, and from the College of Physicians and Surgeons. Medicine was given up for chemistry, and he spent the years from 1867 to 1872 in study at German universities at Munich, Goettingen and Tuebingen, under Liebig, Volhard, Woehler and Fittig, after receiving his Ph. D. at Goettingen serving two years as general assist-

ant to Fittig at Tuebingen. The year 1872 found him back again in America, and as professor of chemistry and physics at Williams College. During the four years following he came prominently into notice as a writer. In 1876 he accepted the chair of chemistry in Johns Hopkins University, and still occupies it, despite urgent invitations to other institutions, a recent and notable one being to the new University of Chicago. As a writer, teacher, lecturer, experimenter and practical workman he is, in all, a success. His lectures are a treat from the entertainment standpoint alone, and his laboratories are thronged with investigators, animated with the enthusiasm of their preceptor. If American chemists can "point with pride" to any particular representative, Ira Remsen is assuredly the one.

EDITORIAL.

CHEMICAL INDUSTRY OF THE U. S.

The chemical industry of the United States is believed by a large proportion of the people not to cut any considerable figure in industrial affairs. But the information set forth by Mr. Bower is evidence that we have been laboring under a gross misapprehension, for the figures he quotes show a very satisfactory aggregate in financial importance in this great branch of manufacturing activity. While, as pointed out, chemical manufacturers have labored under many disadvantages, among which may be enumerated certain operations of tariff regulations, and we would mention particularly the high tax upon alcohol, still it is not surprising that, with our great natural resources and enormous consumption of products in this line, the industry of the manufacture of heavy chemicals has attained so pleasing a proportion. But we are still obliged to import vast quantities and the opportunities for the establishment of productive plants have but just begun to be snapped up. Undoubtedly the next decade will show particularly pleasing increase in the quantities and values of the products enumerated, together with the establishment of plants to develop resources as yet unworked. The figures showing the importance of pharmaceutical preparations are by no means insignificant, in fact they occupy the favored position when placed in comparison with those other countries.

A PERFUMER ON THE TARIFF.

The paper in our Trade Department relating to the proposed tariff reconstruction is of a practical nature, and from a practical business man. It is moderate in tone yet strong in argument, and the points made are brought forth with clearness and decision. Speaking from his own standpoint as a perfumer, the writer represents the views of his associates in this branch of manufacture by making the very reasonable request that, if raw materials are to be taxed, finished foreign products should be proportionately taxed. As proposed by the bill now stirring up so much discussion among our brainy law makers, flower pomades, which are the raw materials of the perfumer's art, are to bear a customs tax, while the finished perfumes coming from the same country whence emanate the pomades, are allowed free. This is certainly an injustice to American perfumers, and, we should think, need but to be called to attention to receive correction.

Mr. Ingram further voices the sentiment of all business men in all branches of trade when he states that the best thing for this country would be to leave the tariff alone for a few years and not tinker and rearrange it every four years.

Commercial industries must be allowed time to adapt themselves to conditions produced by any tariff, high or low, and once having adapted themselves they should not very soon be obliged to suit themselves to a new set of conditions. The financial stagnation from which the country has suffered the past few months has been due entirely to the uncertainty regarding the outcome of legislation which, whatever it might be, would affect business interests in all directions. We commend Mr. Ingram's paper to careful perusal.

POISONED ALCOHOL.

The report in our News Department last issue of a case where a Massachusetts druggist sold poisoned alcohol, which later being drunk by a number of tramps caused the death of two of them, bears some significance other than as a deplorable accident merely. The question where the blame of the casualty should be placed is a little hard to decide. The clerk who sold the alcohol seems to have considered himself on the safe side by placing it in a substance which would render it unfit for drinking, and he further seems to have secured himself by adopting all necessary safeguards in the direction of poison label, caution to the customer, etc.; but is one justified, under any circumstances, in placing a violent poison in alcohol, which is so apt to be used as a beverage? The caution of the pharmacist may be forgotten, a label is easily removed or rendered illegible or overlooked, the bottle may fall into the hands of those wholly unfamiliar with the circumstances attending its purchase, and there are, in short, so many possibilities of serious results arising from such a practice that it seems well to call this particular case to the attention of pharmacists to act as a serious warning to them. Alcohol can be rendered unfit to drink in other ways than by poisoning it, and though we would not wish to add to the sorrow of the clerk who dispensed this poisonous draught, still we do not feel that he is entirely without responsibility in the matter. If any doubt as to the intention of the purchaser arises, the seller assumes most heavy responsibilities in pursuing such a course as was followed in this instance. He should either refuse absolutely to dispense the alcohol, or he could add to it substances of non-toxic nature which would effect the end in view—that of rendering the liquid distasteful as a beverage.

SHOULD THE DOCTOR SUPPLY HIS OWN MEDICINES?

It is very pleasing to find one medical journal, which represents a high class of patronage among physicians, plainly stating that it is not best in most cases for the practitioner to supply his own medicines. The journal in question, *Medical and Surgical Reporter*, states very distinctly that, in the present state of medical affairs, where the community is amply supplied with competent pharmacists, the practitioner has no right to compound or carry drugs to dispense. The trained, qualified pharmacist is worthy of his hire. Pharmacy and medicine, while closely allied, are yet separate and independent branches of the healing art. As a rule, a physician who dispenses medicine loses caste, thereby doing an injustice to his patient and ap-

propriating to himself what justly belongs to the druggist. In regard to the argument that the physician saves the patient the expense of prescriptions and thus retains him, it is advanced that, in many cases he might as well dose his patient with chips or pebbles as to give him the stale, petrified tablets which by long keeping have lost their potency. Further, the patient has no respect for the preacher-practitioner combination, not any faith in the walking apothecary shop, and when he is really seriously ill will pay only for the straight article. These are strong words from our medical contemporary, but we are glad to give them republication, especially the advice that the shoemaker should stick to his last. Pharmacists as a class are appreciative, and no physician ever patronized one without being repaid twofold. If physicians desire to stop counter prescribing, they must give to the honest pharmacist what is really his due, and these words from an influential medical journal will do much to bring about a better state of affairs and to produce a sentiment more desirable than that which has found utterance in many medical periodicals concerning this question.

EXAMINATION QUESTIONS.

Not every would-be druggist can attend a college of pharmacy, but he must bring evidence before the Board of Pharmacy that he is competent to discharge the duties of his profession. To do this involves the acquisition of a certain fund of education, and the majority find that they must be self-educated, and any aid to the attainment of this education is highly appreciated. This number of the *Era* inaugurates a department which we are sure is well calculated to serve a very large proportion of our readers. Its object is to present carefully selected questions whereby the reader can test the quality of his information, and may have indicated to him the direction in which study can best be prosecuted. These questions are selected with the idea that to answer them will require some search of reference works, some practical experimentation, or the exertion of one's reasoning faculties in some particular direction. As a rule, they are to be questions which involve some basic principles or which have direct application to the practical work of the drug store. Their range will be over the several branches necessary to complete equipment for pharmacy, as chemistry, botany, materia medica and the like. It is believed that whoever will apply himself to studying out the answers to these questions as they are presented, will, if not already in possession of it, quickly attain a most valuable store of information which he will find of service throughout his professional career. Incidentally it may be mentioned that many of these questions are of necessity very similar to those which constitute the majority of the questions propounded by the Boards of Pharmacy, and in this way are of service to the intending applicant for examination.

There are a large number of young men who are anxious to attain the necessary qualifications for entering the pharmaceutical profession, but whose prospects for attending a college of pharmacy are very dark. To this class these series of examination questions cannot fail to be of

benefit as testing not only their present acquirements, but in stimulating them to systematic study. It is not expected or believed that these questions can take the place of systematic study, but they will serve most valued purpose in testing the worth of the results attained by the student.

Each series of questions will be supplemented in a later issue by complete replies, which will embody the answers sent in by correspondents, with such amendments and alterations as are necessary in each case. We want readers, too, to send in questions to which they desire answers, and, in short, this department is to serve as a general exchange bureau in the direction indicated.

THE DRUGGIST AS A BUSINESS MAN

The question which now seems uppermost in the professional mind is that of higher education. There is an unmistakable tendency in our schools toward an extension of both the time and the curriculum and all reports that come to us from the various pharmacy boards record the adoption of more stringent methods of examination, which will call for more extended attainments on the part of the candidates for registration. There is no prospect that the path to the practice of pharmacy will ever be less difficult than it is at present. The indications all point the other way. While this good work is going on and all efforts are concentrated to one end, is there not danger that some of the essential qualifications for the practice of pharmacy will be overlooked? Is there not danger that the graduate will become so well grounded in the decimal scale of grams and centigrams that the decimal scale which runs dimes into dollars will fall into neglect? In other words how is the pharmacist to obtain a business education? In a business world, where the failures are said to bear a ratio to the successes of 9 to 1, is it not within the bounds of propriety to insist upon an acquaintance with the rules which govern commercial transactions? It may be said that such knowledge may be gained from a preceptor. But are the majority of preceptors competent instructors in such matters? The fact that a man is in the drug business and has an apprentice cannot be accepted as evidence that he is a successful business man. There are many brilliant successes in the ranks of the retail druggists, and there are quite a number of equally brilliant failures, and it is feared that the former are not numerous enough to furnish separate educational institutions for the instruction of the throng of embryo proprietors, upon whom we must depend for the future conduct of our drug stores. The subject is one which may well engage serious attention. It is believed that there are many successful druggists who take pride in their success, and are disposed to give others the benefit of their ideas. The druggist as a business man is a subject which is far from exhausted. The purchase of goods and the selling of the same, bookkeeping, with its debts and credits, the arrangement of the store, the advertising, the treatment of clerks and customers, and the stoppage of many little leaks in the money drawer are themes upon which much can be said and to which thorough attention should be given.

PRELIMINARY EDUCATION.

No more important and vexatious problem is presented for the consideration of colleges of pharmacy and their faculties than this—how much and of what character should be the preliminary education required of matriculants? The question has been variously answered by the various colleges, the result being that we now have no uniform requirements for entrance; the candidate falling at one institution may easily enter another where the examination is easier, or perhaps, as in some colleges, lacking altogether.

Pharmacy is, and should be regarded as, a learned profession, equal in importance to any, and its followers should possess even more than average ability and knowledge. But is it so regarded by the public? Is it not rather looked upon as a trade? Are our colleges working in the right direction? Pharmacy, in its highest significance, embraces a knowledge, more or less comprehensive and exhaustive, of chemistry, botany, materia medica, therapeutics, and the like. Of these branches, chemistry requires a thorough knowledge of mathematics and a mind at once logical and analytical, while for a sound knowledge of botany, materia medica, etc., Latin is absolutely essential. If the student have not this knowledge before entering the college, he will not there obtain it. Nor is he a fit recipient of instruction such as should be imparted by a school of pharmacy. He cannot understand the terse expositions of chemical problems; he learns parrot-like; he speaks of "empyreumatic air"; he acts the part of a sponge, absorbs, assimilates little, easily and rapidly dries up.

The teaching colleges of pharmacy require but little knowledge of mathematics or English, and none whatever of Latin, nor do they teach these branches; but the instruction given is of a character that presupposes such knowledge on the part of the student, and the luckless wight who knows no arithmetic or Latin, but who has paid his money for a pharmaceutical education, at the final examination for graduation has fired at his unfortunate head problems asking the percentage composition of complex chemical compounds, the correct Latin phraseology for a prescription, and many others, all of which, to him, are not Latin merely, but Greek. He fails in his examination, and goes away with the feeling, in some respects a just one, that his time and money have been obtained by false pretenses. Or, he succeeds, thanks to the superior knowledge of his neighbor in the examination hall, or to a carefully prepared and successfully concealed "aid," or to some lucky chance, and thereafter poses, and is regarded, as thoroughly posted in pharmaceutical lore. Is he a truthful representative of the science of pharmacy?

Under the present system the boy attends school until the age of fourteen or sixteen, obtaining the usual shallow, superficial knowledge of the customary grammar school branches of study, then spends three or four years in a drug store, meanwhile forgetting nearly all he has learned at school; and finally, by means of his grammar school certificate, obtains admittance to the college. Is such a one likely to become a credit to his teachers and an ornament to his profession?

Much has been said relative to the deplorable lack of general education on the part of the majority of drug clerks and college students. Some have advocated the establishment in the colleges of pharmacy of a chair of English. This or similar procedure would not suffice to correct the evil; it would be the application of the axe to the branches rather than to the roots. Let the college demand of its students sufficient knowledge of those subjects necessary to the proper reception and retention of the subjects presented by its teachers. Let it retain, if it choose, the old and faulty lecture system, but supplement the lectures by thorough, practical laboratory work. One is interested and learns much by witnessing an experiment performed by another, but the knowledge becomes one's own when the experiment is carried out by one's self.

The quiz system of instruction now in operation in several colleges has proven very successful, and is not only a step, but many steps, in the right direction. But how many colleges live up to their promises? They advertise thorough training in chemistry, practical pharmacy, microscopy and the like, but the chemistry offered consists of one or two lectures a week, with, during the year, fifty or sixty hours of work in the laboratory, and instruction in other branches is similarly deficient.

Another defect in the college system is that the college education is but a side issue; it is regarded as simply a means of easily becoming a registered pharmacist. That this is so is evidenced by the oft repeated question: "Of what value is my diploma if it is not recognized by the Board of Pharmacy?" A college graduate who is afraid to appear before the board, but holds up before him his diploma as a shield, is no credit to the institution whose son he is. The student, as a rule, gives but a portion, and that the worst, of his time to his studies. His regular occupation is that of a clerk in a drug store. Five or six hours a week, for six months, are all that he devotes to the acquirement of a "first-class pharmaceutical education" in a college "affording unrivalled facilities" for obtaining the same.

So long as the college work is subordinated to drug store duties, so long will exist this unsatisfactory condition of affairs. On the other hand, when the college accepts none but earnest and able students, and furnishes to them a curriculum which will draw forth their best endeavors, and require their undivided time and energy, then will Ph. G. mean something, represent something, be of value.

What is the remedy? Let the colleges establish a standard of examination for entrance sufficiently high to exclude all not of sufficient ability and attainments to do justice to the instruction afforded. It is objected that there will be a great decrease in the number of students. What if there be? It is better to have a few good students than a multitude of numskulls. If a few of the colleges be forced to close their doors, it but proves that they were founded on the sand, not upon solid rock. But the fear of numerical and pecuniary loss is unnecessary. Records of educational institutions all show that so fast as educational standards have been elevated, just so fast has been the increase in numbers, prosperity and rep-

utation. Offer good goods and you will always find a sale for them, while inferior and fraudulent wares are soon detected and refused.

COURTESY BETWEEN PHARMACISTS IN REGARD TO REFILLING PRESCRIPTIONS.

We have been asked what should be the course of conduct for druggist A to pursue when a customer brings to him a bottle bearing B's label and originally filled after a prescription in druggist B's possession. Should he ask B for a copy of the original prescription, or should he direct the customer to go to B's store, or should he send the bottle to B for refilling and have it charged to his (A's) account?

Without taking into consideration any qualifying circumstances, we should say promptly that the customer should be sent to B. Every druggist naturally considers that prescriptions brought to him for dispensing become, after he has filled them, his own. Should a brother druggist ask for a copy of any prescription for refilling, it is merely a matter of courtesy if his request be granted. It seems very plain to us that, whenever possible, the customer be told that his box or bottle was originally filled by B, who holds the prescription and who should be the one to refill it. We realize that often this course would be inconvenient or distasteful to the customer, but it is without doubt the best plan whenever it can be put into force. However, if the customer cannot be sent to the store, A should himself send to B and have the prescription filled, with a distinct understanding that the profits be satisfactorily divided between the two. It is an imposition for one druggist to ask another for a copy of a prescription without rendering any sort of remuneration therefor. Not only is it an imposition, but it is very unbusinesslike, and frequent repetition is apt to cause bad feeling between those who would otherwise have cause for only friendly relations.

But doesn't the whole trouble arise from a reprehensible practice in itself, prescription refilling?

A little of the British severity as exercised toward the brood of nostrums would not be amiss in this country. In England when a patent medicine kills a person something is likely to result from the happening in the way of prosecution of the responsible parties. In a recent case in Great Britain, however, the magistrate was unable to punish the parties responsible for the fatality inasmuch as it was caused by a patent medicine of American make. This medicine is one which is largely advertised and has time and again been proved to contain large proportions of chloral and bromides, and in this instance an overdose through inadvertence caused death. It will be a good thing for the American public when our law-makers place some sort of restriction on the traffic in secret medicines which contain poisonous ingredients. The so-called soothing syrups for infants have killed many more children than they have benefited, in fact the benefit could easily be shown to be only to the nurse or the mother who wishes to quiet the fractious child.

There is desirable the abatement of a very serious evil which, for a number of

years, has been increasing and adding to the burdens of both jobbing and retail trade. There is, to-day, no uniformity in quality or price of many pharmaceutical preparations, even those which are official in the pharmacopoeia and should be of a definite standard of strength. So-called standard preparations are not standard, for there is no standard apparently. A fluid extract of Ipecac will vary in alcoholic strength, in percentage of extractive, in medicinal value, within limits so widely separated that the purchaser can be guided in his selection only by what he knows, or thinks he knows, of the honesty of purpose and reputation of the manufacturer. The necessity for uniformity of quality in the many lines of pharmaceuticals is urgent. As matters now stand, a certain fluid extract may be purchased at almost any price the buyer chooses, according to the manufacturer selected, and it is fair to presume that low price means poor quality. Could the trouble be remedied by the adoption of uniform prices?

Physicians are not altogether unanimous regarding the advantages of dispensing triturates and granules, and many of them are siding with the pharmacists in opposition to this ready-made practice of medicine. One physician in a recently published article points out a serious danger which may attach to the administration of these remedies, in that, having been given to the patient, if any untoward results occur, it is impossible to prove to the satisfaction of anyone what was the exact nature of the remedy. He cites a number of instances where in his professional practice his reputation was saved only through his being able to prove by the pharmacist's prescription file just what was administered to the patient. In one case, where a harmless mixture was prescribed, the patient soon after taking a dose expired, and circumstantial evidence was, of course, in support of the supposition that the medicine caused the death. The prescription was proven, however, to be harmless and an autopsy showed that death was caused by heart disease. The writer points out that had he dispensed a tablet, keeping no written record, he would have lacked a very important proof that death was not caused by the administered remedy.

Pleasingly significant it is that a very candid discussion of this question of dispensing by the physician is being carried on in the columns of medical journals. Pharmacists have cause for congratulation at the tone of these discussions, which may be summed up as discountenancing the practice on the part of physicians, who in the main believe that the practice of medicine cannot be carried on conjointly with pharmacy, and that the field of pharmacy is peculiar to itself, an independent calling, though at one supporting and depending upon medicine.

One of America's so-called "Complexion Specialists" is not having a particularly pleasing or profitable experience in the British Isles. This Madame, aside from being obliged to undergo prosecution for selling a poisonous article, finds herself unable to collect from her agent, the legal decision being that, inasmuch as the preparation she sells is a poisonous one, she cannot legally sell it, and, therefore, any contract with agents is void. She had better come back to America, where

advertising will sell anything and the law does not inquire too closely into traffic of this nature.

The Ohio Dairy and Food Commission is rapidly collecting information which cannot fail to create much surprise, perhaps some consternation, among retail druggists. Our readers have been informed of the examination into the wares dispensed by Cincinnati druggists, but the investigations are not to cease with the probable prosecution of certain retailers in that city. The developments up to the present time are very interesting and calculated to be very beneficial to the profession and to the people. Examination of cod liver oil has proven that a large amount of it now on the market is adulterated with cotton seed oil, and many preparations of wine and cod-liver oil have been proven to contain no cod-liver oil whatever. Some samples of lemon oil have been disclosed 55 per cent of turpentine, 15 per cent of resin, 25 per cent of lemon oil and 5 per cent of water and alcohol. Juniper oil is found to be in about the same condition, and in a number of preparations of wine, beef and iron, no beef is discoverable and but a very small quantity of iron salts. It is probable that the names of the producers of these spurious articles will be disclosed by the commission. They certainly should be.

Should medical professors practice be a question which is agitating the medical faculty at Paris. Some think they may legitimately do so, and others contend that the physician in active practice cannot do justice to his classes, as he is not able to equip himself sufficiently. In order to be most satisfactory as a teacher, he must be a studious and scientific man, and, if true to his trust, will have no time for outside distractions. If it were a rule in this country that medical professors should not practice, we would have either no professors or no practitioners. In the majority of cases the doctor needs the income, whatever it may be, from his teaching to eke out his professional intake, and the reverse of this obtains equally.

How many minor industries, of which the world knows little, contribute their portion toward the support of humanity. Unconsidered trifles in the aggregate form the total of our material comfort, prosperity and advancement. One of these trifles, interesting to the druggist and the doctor, is treated on another page, where a correspondent describes the process of the manufacture of silk-worm ligatures. The little strand which binds a wound is not unimportant.

What can the pharmacist do in a practical way to carry out the views expressed by the International Pharmaceutical Congress, that he should engage in sanitary work, be in fact "the common chemist of the common people?"

THE U. S. DISPENSARY.

We learn that the new U. S. Dispensary will be ready about the second week in February. Its pages will be one inch wider but no longer, so that the book may be placed upon shelves of the usual height. Part 2 will be in double columns and will discuss all the new remedies. The book has been entirely revised and will be printed from new type.

[Written for the Era.]

THE EXPLOSIVE AND INFLAMMABLE COMPOUNDS OF THE U. S. P., 1890.

By F. J. WULLING.

A thorough pharmacist is, or should be, among other things, a thorough chemist. He knows not only something regarding the physical properties of the substances he handles, but he also knows a great deal regarding their chemical disposition. His knowledge of chemistry extends beyond known and demonstrated facts, he is intelligent enough to foretell in many cases the actual or probable result of the bringing together of chemicals or compounds, which he, or others, had not before brought together. Knowledge is relative; the greater the acquaintance with the relations of things to each other or, which is the same thing, with relative facts, the greater the knowledge. Knowledge begets knowledge, and the acquisition of it proceeds in an increasing ratio; that is, relative facts already acquired aid, in their application, in discerning and acquiring facts not before known. The pharmacist knows what will result if he brings solutions of zinc sulphate and lead acetate together, because he has often mixed them—he demonstrated. He knows that the precipitate formed is lead sulphate, and that lead sulphate precipitates because it is insoluble. He learns from this that lead sulphate may be produced by bringing together, for instance, lead nitrate and diluted sulphuric acid, or by reacting upon any soluble lead salt with any soluble sulphate—he deduced or discerned. All deductions are not so sequential, but opportunities are presenting themselves daily to pharmacists to deduce or discern or reason out (to them) unknown truths from principles already known to them. The application of this capacity to deduce correctly would probably have obviated many accidental explosions and conflagrations and their results.

The greater the pharmacist's skill to discern and deduce correctly, the greater is his ability. Not all facts are deducible, however, some must be discovered. When one's ability to deduce is insufficient to establish a fact, recourse may be had to discovery, if the distinction between deduction and discovery as here applied be permitted. Such discovery would be intentional discovery, but discovery is not always intentional, more often it is unintentional, and the latter has probably been the greatest means of making us acquainted with the nature of explosive and inflammable compounds.

In the U. S. P. there occur a number of substances which are explosive or inflammable, or which, when brought in contact with certain other bodies, induce explosion or inflammation, or both. It is the present purpose to study the relations of those bodies to each other and to others, especially the chemical relation, in order to be better able to deduce and discern, and thereby obviate, perhaps, explosions or inflammations and the disastrous results often ensuing. The substances to which reference will be made are the following conveniently classified as oxidizing and reducing agents:

OXIDIZING AGENTS, OR OXIDIZERS.

Nitrates, including Nitric Acid and all dry nitrates and the oxides of nitrogen and their combinations.

Chlorates, including all dry chlorates, and the oxides of chlorine and

Hydrochloric and Nitrohydrochloric Acids.

Chromic Acid, including Potassium Bichromate.

Silver Oxide.

Potassium Permanganate.

Iodates.

REDUCING AGENTS FOR OXIDIZABLE OR COMBUSTIBLE BODIES:

Charcoal.

Phosphorus.

Hypophosphites.

Sulphur and Sulphides.

Glycerine.

Sugar.

Alcohols.

Ethers.

Organic Matter, Cork, Pill Excipient,

Dust Extracts, Hydrocarbons, Organic Acids, etc.

Iodine.

Reduced Iron.

Zinc, powdered.

Cyanides.

Thiosulphates.

In the study of these bodies the behavior of the chemical force occupies most attention. Explosions are not induced by the chemical force alone, but by physical force as well; the physical force according to which bodies become contracted in volume by cold and expanded by heat is often responsible for accidents. Bottles or other vessels containing light, volatile or inflammable liquids, such as alcohol, ether, chloroform, benzine, ammonia, etc., should never be wholly filled, because an increase of temperature causes an expansion of the liquid, the expansive force being usually great enough to burst the most substantial vessel. The disengaged vapors, or liquid, may come in contact with a flame and induce accident. There are numerous accidents on record due to negligence in this respect. The phenomenon explosion, therefore, deals mainly with the chemical force. The characteristic of this force is that when it exerts itself upon or between two or more bodies, these become changed in their composition, yielding one or more bodies which are unlike them in structure or composition. This change usually takes place in a very gradual and orderly manner and without producing heat in the majority of instances; sometimes, however, the rearrangement of the atoms, according to their affinities, is very rapid and even violent, in such case the chemical force exerting itself, as it were, upon every atom and molecule at nearly or exactly the same moment. Explosions, therefore, are very violent chemical actions for the most part. The rule is that the more rapid the action the greater is the friction produced by the movement of the atoms and molecules, and consequently the greater the heat produced. Friction produces heat, matches are ignited because the heat produced by the friction caused by striking the sulphur-tipped end is high enough to ignite the explosive and inflammable mixture. Every substance has a kindling point; that is, every substance can be made to burn by raising its temperature high enough. Burning is a chemical action, but no body will burn below its kindling point. Above the kindling point the chemical action is usually termed burning, the latter term associating with it the idea of heat and flame. Explosions are usually, though not invariably, accompanied by heat and flame. Violent

chemical action, whether accompanied by heat and flame or not, is usually a form of oxidation; that is, there is a part or the whole of the action depending upon the union of oxygen with some other element or compound. Bodies rich in oxygen, as potassium chlorate, nitric acid, oxide of silver, etc., which, under favorable circumstances, part with some or all of their oxygen, the latter combining either in an orderly or violent manner with other bodies, are oxidizing agents, which are acted upon by oxidizing agents become oxidized; the oxidizing agents at the same time becoming reduced. The oxidized bodies, because they reduced the oxidizer, are termed reducing agents. Violent chemical actions, whether accompanied by explosions or inflammations, or not, are simply oxidations and reductions, there being of necessity a reduction where there is an oxidation. Thus in the preparation of iodide of potassium, the iodate formed is reduced by carbon, which at the same time becomes oxidized:

The term oxidation is also used irrelative of oxygen, and in a broader sense (which includes the above) is applied in any case in which the valency (combining power) of an element is increased. Reduction implies the decrease of valency. Thus in the preparation of Solution Chloride of Iron, the ferrous chloride, formed by acting upon iron with hydrochloric acid, is oxidized into the ferric chloride, by means of nitric acid:

In this instance the iron is bivalent in the ferrous state and quadrivalent in the ferric. The graphic formulae will illustrate:

In the former one atom of iron has two free bonds, in the latter two atoms of iron together have six bonds (one bond of each of the two iron atoms uniting with each other, leaving six bonds free), the iron has been oxidized, yet it is not in combination with oxygen. The nitric acid, when it oxidizes, yields free oxygen—in this case the oxygen combines with the hydrogen in the hydrochloric acid, leaving the chlorine free to combine with ferrous chloride to form the ferric chloride. The corresponding reduction takes place in the nitrogen in nitric acid. In the latter nitrogen has five bonds or is quinivalent:

In the NO formed it has only two bonds, or is bivalent.

These illustrations may serve to better illustrate that which follows:

Chlorates, etc.—Of the explosives of the Pharmacopoeia, or those likely to cause explosions or inflammations, the chlorates of potassium and sodium are perhaps the most dangerous and yet the most frequently used. It will be noticed that the list of oxidizing agents above contain other bodies with as much oxygen as the chlorates; they are not as dangerous, however, excepting perhaps the compounds of nitrogen in some forms, because they do not part as readily with their oxygen as the chlorates, in which the chemical affinity between the chlorine and the oxygen is only very feeble.

The application of a slight heat to potassium or other chlorates will cause the oxygen to become liberated, leaving the potassium chloride behind as a residue.

This heat may be produced by friction, the latter differing from applied heat in often causing all of the oxygen to be liberated at once, producing explosion—hence chlorates should never be triturated or rubbed very briskly, neither alone nor with other bodies. Potassium chlorate has exploded when triturated with sulphur, charcoal, antimony sulphide, muellage tragacanth, phosphorus, various forms of organic matter, etc., in each of these cases the oxygen of the chlorate uniting with the other bodies present:

With hydrochloric acid the chlorates produce the gas euclorine, which is highly explosive.

This gas, when in contact with glycerine or other organic bodies, oxidizes them violently usually producing explosion. A favorite prescription with many physicians contains tincture chloride iron and potassium chlorate, and often glycerine. The latter should not be added because of the liability to produce explosion by the action of the chlorate directly upon the glycerine, or by the action of the free hydrochloric acid in the tincture upon the chlorate, forming euclorine, which with glycerine usually explodes. The presence of water lessens the possibility of explosion, yet explosions have occurred in presence of water in the above mixture. Chlorates are not used extensively in pyrotechnics, because of their property of causing too rapid and sudden combustion.

Not only is euclorine explosive, but all of the other oxides of chlorine exhibit a similar tendency, and free chlorine also has great chemical affinity. They should always be regarded with suspicion and should be handled with the utmost care. Free chlorine will explode violently with sulphur, or metallic antimony, if the latter is dropped into it in a finely divided state, and with many other bodies. Chlorine, and its oxides and their compounds including the chlorates therefore should be carefully used and their probable action upon other bodies anticipated by deduction as far as possible, and obviated or circumvented if possibly explosive. The presence of water where admissible usually effectually obviates explosion.

Iodates, too, have frequently exploded with reducing agents, but their use is very limited, and hence accidents less frequent than with chlorates.

Hydrochloric and Nitrohydrochloric Acids, the latter especially, are powerful oxidizing agents. Mere contact of the latter, freshly prepared and in its undiluted state, with many bodies induces explosion.

Nitrates and Nitrites, with some exceptions, are not in themselves explosive, but they are often instrumental in bringing about explosions, owing to their large percentage of oxygen. The oxygen is more firmly united with the nitrogen than it is with the chlorine in chlorates. Nitric acid is perhaps the most powerful oxidizing agent. The higher oxides of

nitrogen also are powerful oxidizers. When nitric acid comes in contact with readily oxidizable substances, the chemical union is often accompanied by detonation and sometimes by rapid inflammation; by the latter especially if the body is organic. Inflammation and often violent explosion have resulted when strong nitric acid acted upon alcohols, ethers, phosphorus and its lower combinations, etc. Nitric acid oxidizes most metals and enters into the preparation of many compounds in many of the processes explosions are liable to occur at any time, especially if the temperature is not guarded. Whenever nitric acid acts as an oxidizing agent it splits up in such a manner that two molecules become resolved into water, oxide of nitrogen and free oxide:

The oxygen induces the oxidation, and sometimes the nitric oxide also takes part in the oxidation by acting as a carrier of oxygen from the air to bodies to be oxidized, as is the case in the manufacture of sulphuric acid.

Some of the most violently explosive compounds contain nitric acid in their constitution. Nitroglycerine, the most formidable of modern explosives, is the result of the action of nitric acid upon glycerine in the presence of sulphuric acid.

Spilled upon wood or other organic substances, nitric acid often causes fire immediately; explosions and fires have resulted from spilling it into sawdust and into excelsior. It is expedient to have ammonia water in proximity to nitric or any other strong acids, to use to neutralize with at a moment's notice.

Pyroxilin, soluble gun cotton, with whose inflammable nature every pharmacist is familiar, contains nitrogen oxide derived from nitric acid:

Nitrogen in various combinations may at times prove dangerous—the nitrogen in ammonia, and also in spirit nitrous ether, is known to have exploded violently with tincture iodine and other preparations of iodine, having formed the explosive iodide of nitrogen. Subnitrate of bismuth has exploded with bicarbonate of sodium. Aromatic spirits of ammonia with chloral hydrate have caused explosions after several hours' contact, due probably to the oxidizing property of the nitrogen in the ammonia inducing the decomposition of the chloral with formation of chloroform.

Potassium Permanganate.—Of this salt the Pharmacopœia says that it should be kept in glass stoppered bottles protected from light and that it should not be brought in contact with readily oxidizable bodies. Explosions with permanganates are very rare—in the writer's experience a slight detonation ensued upon triturating permanganate with calcium hypophosphite. Its well known oxidizing power is due to the oxygen which it liberates in presence of organic matter and sulphuric acid.

Chromic Acid.—This oxide is very powerful in its oxidizing properties, mere contact with many bodies, such as alcohol, ether, glycerine, sugar, tannin and other organic or easily oxidizable bodies being sufficient to cause sudden and violent explosion. In oxidizing other bodies it loses all or part of its oxygen. Great

caution must be observed in handling this oxide, not alone because of its violent explosive nature, but also because of its caustic action upon the tissues. Burns resulting from it heal with difficulty and often turn into ulcers.

Bichromates.—There are records of explosions resulting from potassium bichromate in presence of strong acids. The latter produce chromic oxide:

Silver Oxide.—If this oxide is triturated with oxidizable or combustible bodies, explosion ensues. It is often prescribed in pill form, and explosions have ensued during their preparation and afterward. Gelatine capsules are recommended as safe vehicles for dispensing the oxide. When triturated with phosphorus violent explosion takes place; with solutions of ammonia, a rapid disengagement of nitrogen gas is produced, sometimes resulting in explosion. The oxide induces explosion with creosote and with other organic compounds. When this oxide enters into these violent reactions it becomes reduced to the metallic condition or to the lower oxide.

With silver oxide we leave the oxidizing agents, to consider briefly the reducing agents, much of that said in reference to the former having bearing upon the latter. The reducing agents are all more or less capable of taking oxygen into their composition or uniting with it to form other combinations. The intensity of the chemical action determines the violence of the explosion, if any. They are not invariably oxidized by oxygen.

Charcoal is the common reducing agent, but explosions with it are infrequent. It is the reducing agent in gun powder, in which it is oxidized by the nitrate of potassium, this being reduced to the sulphide. Triturated with chlorates and nitrates, it is liable to cause explosion. The products of its oxidation are carbon monoxide and carbon dioxide.

Hypophosphites have exploded when triturated alone. They are liable to explode with any of the oxidizing agents, especially with the chlorates and nitrates. The products of their oxidation are dependent upon the oxidizing agent, and are usually phosphites or phosphates or phosphoretted hydrogen. This applies to all the official hypophosphites. Care should be exercised in making the syrup hypophosphites, not to triturate the salts without the addition of a little water.

Phosphorus ignites spontaneously in the air, or with greater promptness in oxygen, or with bodies yielding oxygen. Explosions have occurred in the preparation of phosphoric acid, when the phosphorus came in contact with the nitric acid. The utmost care should be had in using phosphorus—phosphorus burns heat very slowly and are very painful.

Zinc Phosphide, when exposed to the air decomposes, the phosphorus uniting with the oxygen in the air. Explosions have occurred when it is rubbed with potassium chlorate.

Sulphur often becomes oxidized so quickly that explosion ensues. If triturated or heated with chlorates or nitrates it may produce explosion. Violent explosions have followed its admixture with chlorinated lime.

Sulphides sometimes in chemical decomposition become resolved into sulphur and the metal, the same operation

sometimes causing the sulphur to become oxidized with violence.

Carbon Dioxide is dangerous chiefly because of its extreme expansibility. It has exploded with concentrated nitric acid.

Glycerine has frequently caused explosions. It reduces nitric acid, chromic oxide, potassium permanganate, potassium chlorate, chlorinated lime and many other oxidizing agents with explosive violence.

Reduced Iron and Powdered Zinc have caused detonations with chlorates.

Sugar, Alcohol, Ethers, Oils and other organic compounds may cause explosions with the more powerful oxidizing agents.

Iodine, or preparations containing it in the free state have caused violent explosions with ammonia, the explosive compound formed being the iodide of nitrogen. A paper filter through which a concentrated solution of iodine and iodide of potassium had passed, and which subsequently dried, was shivered into atoms with a loud explosion when it was endeavored to remove it from the funnel.

As a rule, all of the oxidizing and reducing agents given above react upon each other under certain circumstances with explosions as the result in the majority of cases. The cautious pharmacist is ever careful in manipulating them.

[Written for the Era.]

SILKWORM GUT.

By W. Lodian.

The best silkworm gut in the universe comes from Nurcia, a city in southern Hesperia. It is made in several other parts of the world, but the quality is always inferior. Great care is taken by the Nurcians in its manufacture. Thus, beginning with the seeds or eggs that eventually develop into the full-grown silkworm, they find that the best results are obtained by developing the eggs of the Bombyx mori, or Chinese moth. Much attention is paid to the choice of suitable eggs, and considerable study devoted to their incubation. A marvel it is that so much care is devoted to the hatching process, whereas, once hatched and in the growth of the silkworm, scarcely any attention is paid. Care, however, is taken in these respects: Before sweeping the floors of the rooms where the worms are growing, moist sawdust is thrown on the ground to take the dust. Only fresh mulberry leaves are given the worms to feed on, care being taken not to let stale ones get among them. And (a seemingly needless precaution) the operatives or watchers are warned not to use to bring in fresh leaves the same baskets that are used to carry out the old leaves.

The worms are first called gusanos-de-seda. In a few weeks they are known as tripes de gusanos-de-seda. French surgeons and anglers call them boyaux de vers-a-soie-de-seda (the literal translation of which is singularly ridiculous).

It is on the third day of the first month of the year that the eggs are put in position for hatching (incubation). Some little while prior to the incubating process they are steeped for some 150 minutes in water kept at a warmth of nearly fifty degrees. The eggs are next laid out on canvas for a while, care being taken not to let them touch each other, and they are placed in an apartment in which a current of air can circulate over and about them, thus insuring desiccation.

During the first twenty-four hours the air ought not to exceed 62 degrees Fahr.; for the second twenty-four, say 63 degrees; up to seventy-second hour, 70 degrees. Proper treatment usually causes the larva to appear in about a week after setting the seeds or eggs to incubate. From 250 to about a thousand eggs are considered a layer, and the number of layers varies according to the speculation of the growers as to what the demands of the market are likely to be.

Much more care is taken with the larva in other countries than in Hesperia. Here the development of the seeu is left to itself and the result is the Hispanian worm emerges in a semi-savage state. This is particularly apparent when the worm is suffered to develop into a moth. After resolving itself thus, the feminine individual of the Bombyx mori hardly stirs. After association with the male, it lays its eggs and dies.

Directly the worm appears, it begins feeding, and so continues for two or three days. The finest leaves of the mulberry are alone used, and these are minced into small pieces by a razor-like cuchillo (knife). Care is required not to bruise the leaves, as, the sap being liberated, the worms reject them as spoiled, or will only touch them when they can get nothing better.

The worms are placed on shelves of bamboo or on the ground and the mulberry leaves are strewn over them from nine to ten times altogether during the course of their growth. They are allowed to gorge themselves to satiety. The worms are placed in thatched-roof sheds, and, as sudden changes of temperature are almost unknown in southern Iberia, scarcely any provision is made for a possible cold blast, which would be liable to kill all the gusanos in a single night.

About the expiration of the fourth day the silkworm goes off to sleep for about as many days as it has already existed. On awakening the supply of mulberry greens is renewed, and greedily devoured. This goes on for nearly a week, when, being surfeited, the little animal revels in innocent sleep for the short space of 100 hours or so. When a fortnight old it will be seen devouring entire leaves rapaciously, day after day, until it is three weeks of age, when somnolence overcomes it—this time—for only about a day. On awakening it will go on an eight or ten days feast at a stretch and will consume such an amount of green stuff that the marvel is how he holds so much. Becoming helplessly fat, it takes its final nap, which lasts a day. Having had its last sleep, it sets to work on the final gorg. For one and a half weeks it will eat, eat, eat, causing to disappear a terrific quantity of leaves. The effect is patent. By the time the worm is six weeks old it has bloated itself to the utmost, and, judging from its actions, is uncommonly uncomfortable. It will be seen trying to climb anything which can be climbed. This is the all-important moment for the gut-producer. It is proof that the worm is about to spin, wants to rid itself of its silk.

At this juncture the worm is watched closely. When it is on the point of spinning, or within a half hour thereof, it is pitched into a vessel containing vinegar. It is dead in a twinkling. The worms are kept in this sour wine for about half a day, or say one night. There are a couple of silk-guts in each worm and

the picking hardens the gut. In the early morning they are turned out and are easily pulled apart. An operative, generally a sweetly-paid senorita, takes a dead worm between her fingers and deftly draws it asunder. After a little practice, she is enabled to speedily take out the gut-sacks. It is disagreeable work. Taking a silk sack between the fingers, the operative gently draws it out to its limit, making a very long thread. She must not stretch it too much or it would part. Being soft, care has to be taken. Each line, which is cased in a thin filament known as carne (and this has to be removed subsequently), is cast on the floor until a sufficient number have accumulated. They are next cleaned in running water and are strung up to dry. On the complete disappearance of the moisture the lines are put into bundles of from 3,000 to 8,000 and upwards, and disposed of by the pound to merchants or dealers.

When in the hands of the merchants, the first operation is to remove from the gut its coating of dried flesh, which has a yellow tinge. This is the tegument of the silk-sac, which, having been removed, leaves only what would have been silk if the worm had been allowed to spin it. Formerly the covering was removed with the nails or teeth, but this process left the gut in an unsatisfactory state. It is now done chiefly by treating it chemically and the covering is easily removed. Next the gut is made into small bundles and put aside.

Care is exercised to preserve the humidity of the commodity up to the next procedure, which is that of selection. Taking a quantity of gut, placing it in a cloth which they hold between their knees, women do the process of selection. Drawing the gut out, line by line, they put one end in the mouth and hold it there until they apply friction by a rag. The tegument clears away any tiny pieces of tegument yet remaining, and renders the gut lustrous. When thus holding it, these females eye it closely and determine its quality. This is judged by its thickness. Every finger represents a grade, and the strands are piled up between the fingers until the hand is full. Then it is laid in a cloth, rolled up, and left overnight to straighten out.

String by string, the succeeding day, it is assorted once more, and the flat gut is parted from the round gut, which latter commands higher prices. Next there is a selection in regard to length, and then it is counted by the gross, tied at the frayed extremity, and skinned. Having been dried, jute is put around the tail-end of the skein. Straightening, rubbing and polishing follow. Ten of the skeins make 1,000 strands of commerce.

In the selection of gut there are a few a-b-c kinks which may be remembered with advantage by purchasers. The worth of gut consists in its quality and length. In the United States and Great Britain the lengths most esteemed are from 11 to 12-1/2 inches. Usually the latter is valued at about 15 per cent more than the 11-inch. Lengthy gut, from 14 to 19 inches, has a steady sale in the sister republic across the Pyrenees, but in America its importation is only just beginning to be felt. Rotundity, hue and freshness determine the true nature of gut. Its newness is, as a rule, decided by the end, which is fuzzy, and, if this can be an immaculate white, it may be considered

of recent manufacture. Of the gut itself, the color should be a pearly white, glossy and untinged by yellow. Eye and finger will familiarize one with its ovality. Turning the skin toward the light will reveal any blank or quality-reducing spots.

To detect unevenness or flatness, if the thumb and finger are passed along the gut, the inequalities are very soon apparent. The flat strands are worth about 50 per cent less than the round ones. The rough strands should not exceed by 20 per cent the good ones; and it is lucky if it is only 10 per cent.

Surgeons and anglers should recollect that, before attempting to tie or knot gut, it ought to be put to soak in cold water. Regular gut requires half an hour's steeping to make it pliable. Other grades need from one hour's to half a day's steeping.

A quarter of all the gut turned out is estranda (crooked). The percentage of the various kinds of thickness differs every twelvemonth. The exertions of gut people are ever in the direction of turning out the thickest and largest gut possible. The production is always one of speculation and doubt.

To prove the increasing interest taken in the silkworm gut in English-speaking countries, it is only necessary to point out that in the United States alone some half a thousand persons or so are entirely indebted for their salary to occupation found for them by this article; while at a conservative estimate 25,000 people are interested in its sale, and the uses to which it is put. This calculation does not include the thousands of anglers who use the *gusano-de-seda* product.

Apart from the information gathered on the spot during travels in Spain, the writer acknowledges his indebtedness for "pointers" to the Messrs. Carswell and Imbrie, both authorities on the subject. With regard to cost the latter gentleman writes: "It is very difficult for the merchant to estimate closely the cost of each size, quality and length; indeed, it is impossible for him to do so at all on any single lot. Only by a very accurate knowledge of what he can obtain for the different grades, as well as for the most salable grades and lengths, together with the faculty of close practical general averaging of his season's products, can he feel at all certain how to fix a cost price on each of the sizes, qualities and lengths."

As a ligature, there is a constant demand among surgeons for silkworm gut. It was first used in a surgical case in Scotland over sixty years ago. American surgeons have, within the past few years, used it with considerable success. As a ligature in securing main arteries it is found of inestimable value.

In the present paper all that is said on the subject is based on long observation, obtained at the expense of much travel. The process is, to a large extent, an open secret, but in Iberia, a silver key opens all doors.

A RUSSIAN PICK-UP. A liberal draught of petroleum. It is claimed, will restore the stupid drunk to his normal condition. We have heard of some individuals who imbibe freely of kerosene for the purpose of bringing on intoxication, and in exchange for the Russian hint, we offer this one.

REMARKS ON THE CHEMISTRY OF BACTERIA.*

By R. Warrington.

The immense variety of substances produced in the vegetable kingdom has always been a source of astonishment to the chemist. The plant is, indeed, the finest chemical laboratory with which we are acquainted. While some kinds of chemical work are common to all plants, there is hardly a species which does not possess some special capacities—which does not produce some products different from its neighbors. When we survey the whole vegetable kingdom, the extent to which this specialization is carried, and the immense variety of the products obtained become simply overwhelming. Chemists are still unacquainted with the larger part of the substances produced by plants. When we turn from the products of plant work to the materials employed our wonder still increases, for these materials are of the simplest kind—water, carbonic acid gas, oxygen, nitric acid, and a few inorganic salts—yet out of these the whole of the immense variety of vegetable products is constructed.

This being the case we need hardly say that the methods of plant chemistry are of supreme interest both to the chemist and to the vegetable physiologist. By the aid of what forces, through what course of reactions, are the simple materials molded to their final issue? The higher plants are in some respects unfavorable subjects for study of plant chemistry. Their different parts have different functions, and the changes in progress are obscured to the student by the fact that changes of a very different type are in progress at the same time, and in places very near to each other. What would not the physiologist give if he could isolate a single cell, and grow it by itself in solutions of known composition; when by studying the nature of the cell's new growth, and the variations taking place in the nourishing solution, he might hope to be able to grasp the facts of cell nutrition, and the nature of its waste products?

Such an opportunity is actually afforded when we study the chemical changes brought about by bacteria.

In bacteria we have the vegetable cell in its simplest form; we have a mass of protoplasm and a cell wall, but the cell is single or united with a few others, and, as far as we know, the life changes in all the cells of every species living under the same conditions are the same. Moreover, these organisms grow freely in suitable solutions, and the chemical changes produced in the materials held in these solutions can be readily ascertained. We have thus in a study of the chemistry of bacteria a splendid opportunity for enlarging our knowledge of plant chemistry, and, indeed, of becoming acquainted with the fundamental reactions on which synthetic organic chemistry depends.

The study of the chemical work performed by bacteria has occupied as yet but a few years, but the results have been most remarkable. The immensely numerous species of bacteria have been found to exhibit an almost equally great diversity of action. Different members

of the class have been found to flourish under entirely opposite conditions, to feed on wholly different materials, to perform an immense variety of chemical work upon the media in which they live, and yet the chief product of plant life—the formation of protoplasm and cell-wall—is probably in each case practically the same. The study of the chemistry of bacteria has thus greatly enlarged our conception of the chemical powers of the vegetable cell.

As a contribution to the discussion I propose to call attention to the chemical actions displayed by three species of bacteria existing in the soil, and all of first-class importance in their relations to agriculture.

It is well known that all ordinary soils contain organisms possessing a vigorous power of oxidizing—of bringing about a combination between the oxygen of the air and various organic and inorganic bodies. Thus dead vegetable and animal tissues in soil are, under favorable conditions of heat and moisture, resolved into carbonic acid, water, and nitric acid.

Particular experiments show that the nitrogen of albumin, gelatin, agaragin, urea, ammonia, ethylamine and thiocyanates is converted by soil into nitric acid. Nor is the action confined to organic matter; for nitrates are oxidized to nitates, iodides to hypiodides and lodates, and bromides to hypobromites and bromates.

The organisms producing nitric acid have been made the subject of study by many chemists, and after much labor and many disappointments, they have been satisfactorily isolated.

We now know that the production of nitrates in the soil—a process of the greatest importance for the nutrition of agricultural crops—is accomplished by the actions of two organisms, each of which performs a distinct stage in the work. By one organism ammonium carbonate is oxidized and the nitrogen converted into a nitrite. By the second organism nitrites are converted into nitrates. We have here an excellent example of the way in which certain special functions, certain narrowly limited lines of work, are exercised by individual species of bacteria. The nitrous organism can oxidize ammonia to nitrite, but it cannot change a nitrite into a nitrate. The nitric organism, on the other hand, oxidizes nitrites readily, but it cannot oxidize ammonia. Both organisms are present in all fertile soils, but the formation of nitrites is not usually perceived, as they are at once converted into nitrates.

The organisms we have mentioned grow and perform their functions when certain inorganic salts supplying phosphates, sulphates, potassium, calcium and magnesium are present. The continued omission of one of these has proved in several cases to bring about a cessation both of growth and function. The general fact is familiar to physiologists, but it is singular that we have as yet no rational idea of the mode in which these various inorganic bodies assist in plant nutrition, with the exception of the fact that sulphur, and possibly in some cases phosphorus, are constituents of albuminoid bodies.

As to nitrogenous food, these organisms are amply furnished by the ammonia, the nitrite, or nitrate which is intentionally added to the solution; the addition of no other nitrogenous substance is

*A paper read before a conference of Sections B and D, Nottingham Meeting, 1893. Reprinted from the *Chemical News*. Ph. Jour.

necessary. Here, too, we are on familiar ground. Ammonia and nitrates are both well known as the most appropriate nitrogenous food for plants.

When we inquire, however, what is the source of carbon to the nitrifying organisms, we are confronted by a startling novelty. It is found to be quite unnecessary to supply these organisms with any carbonaceous food save carbonates, bicarbonates being preferred. The fact of the conversion of carbonates into organic cell substance has been conclusively proved in the case of the nitrous organism; it is at present assumed to be also true of the nitric organism, as this also requires the addition of no organic carbon to its nutritive solution.

The fact that green plants exposed to sunlight are capable of forming organic substances from the carbonic acid and water of the atmosphere is well known to physiologists, but it is equally certain that this action does not occur in the dark. Yet here we have a colorless cell, destitute of chlorophyll, growing in the dark, which, nevertheless, is capable of decomposing carbonic acid, and producing from it carbonaceous cell substance. From a purely chemical point of view this reaction may well appear at first sight incredible, as the decomposition of carbonic acid is an action requiring the consumption of much energy, which in the case of the green plant is supplied by the sun's rays, but in the case of the nitrifying organism is supplied in no such way.

This theoretical difficulty disappears, however, when we look at the whole reaction brought about by the nitrous organism. This organism attacks carbonic acid in its combination as ammonium carbonate, and the formation of an organic carbon compound proceeds at the same time as the oxidation of the ammonia; the result of the whole reaction being the liberation of heat, and not its consumption. A supply of external energy is thus not required.

Expressed in its simplest terms, the green plant manufactures carbohydrates from carbonic acid and water by a consumption of solar energy as follows:

The nitrous bacterium oxidizes ammonium carbonate, producing at the same time ammonium nitrite and a carbonyl hydrate; this reaction we may express in its simplest form as follows:

The equation, however, by no means fully expresses what actually occurs, as Winogradsky finds that 35 parts of nitrogen as ammonia are oxidized for one part of carbon assimilated; the whole reaction is thus strongly exothermic.

The nitric organism multiplies more slowly than the nitrous and does not, therefore, afford so good a subject for quantitative experiments; its nutrition has not yet been fully studied.

The last organism I wish to speak of is the one of which Winogradsky has given a preliminary description during the present summer. It has been obtained from soil and possesses the remarkable power of assimilating the free nitrogen of the atmosphere. To accomplish this assimilation it is simply necessary to grow it in a solution containing sugar (dextrose) and the necessary salts, no combined nitrogen being supplied. Under these circumstances a vigorous growth of the

bacillus takes place, the sugar undergoes a butyric fermentation, and at the end of the operation it is found that the culture has acquired nitrogen, the amount being apparently about 1-500th of the weight of the sugar fermented. By using as much as 7 grams of sugar, an assimilation of 14 milligrams of nitrogen has been obtained. Washed air, free from ammonia and nitrates, was used in these experiments.

That a vegetable organism should be able to acquire from the air the whole of the nitrogen which it needs is certainly very remarkable, and is an extraordinary fact both to the physiologist and chemist.

We have no clue as yet to the mode in which the nitrogen enters into combination; but it is evident that, in this case, as in the nutrition of the nitrous organism, the difficult piece of chemical work forms but a small part of a much larger reaction that is at the same time in progress, and with which it is essentially connected.

It seems not improbable that these results of Winogradsky will explain some facts which have hitherto presented much difficulty. That a special organism, when in union with the roots of a leguminous plant, is capable of bringing about the assimilation of the free nitrogen of the air is now admitted by all; but it is denied by Schloesing and other accurate observers that the same organism when living in the soil has any such property. May we not suppose that for the assimilation of nitrogen to occur the organism must be supplied with sugar or its equivalent, and that this supply of sugar to the organism only takes place when the organism gains access to the sap of one of the higher plants.

In conclusion, I think we shall agree that, however imperfect is our knowledge of the chemistry of the three species of bacteria we have considered, the facts which have been established have at least enlarged our conception of the capabilities of a vegetable cell, and I trust that some light has also been thrown on the general method by which some of the extraordinary chemical results are attained.

THE CHEMICAL INDUSTRY OF THE UNITED STATES.*

By Henry Bower.

The chemical industry of the United States, in common with the other leading branches of manufactures, shows a remarkable increase in the decade between 1880 and 1890, and this is accompanied, in some instances, by results of such magnitude as to become phenomenal. Totals of productions of chemicals in the United States in 1890:

	Value.
Alum (94,174,008 lbs.).....	\$ 1,625,210
Coal tar products.....	687,591
Dyeing and tanning extracts and sumac.....	7,947,811
Gunpowder and explosives (408,735,980 lbs.).....	10,802,131
Fertilizers (1,818,552 tons).....	34,038,452
Paints, white and red lead colors, and varnishes.....	52,434,690
Pharmaceutical preparations.....	16,486,613
Potash and pearlsh (4,874,459 lbs.).....	185,247
Sodas (329,369,633 lbs.).....	5,234,409

*Read before the World's Congress of Chemists, August 25, 1888. Reprinted from Jour. Amer. Chem. Soc.

Sulphuric acid.....	6,522,591
Wool alcohol and acetate of lime	1,885,469
Chemicals, including all acids, bases, and salts not heretofore enumerated.....	25,140,425
All other products.....	12,903,943
Total.....	\$176,044,633

Sulphuric Acid.—The most important of all chemical manufactures is sulphuric acid, which maintains its supremacy over any other known article in promoting the manufacturing interests of the world. The large increase in the number of establishments and in the quantity produced indicates the advance that has been made in general manufactures in the United States during the last decade.

During the year ending June 30, 1890, the following quantities of sulphuric acid were manufactured:

50° B. 948,129,821 lbs., valued at.....	\$3,299,707
60° B. 19,078,597 lbs., valued at.....	112,540
66° B. 328,101,657 lbs., valued at.....	3,110,341

Total value.....\$6,522,591

This includes 50° acid used in the manufacture of fertilizers.

In order to obtain an intelligent comprehension of the extent of the entire sulphuric acid industry, it is advisable to reduce the foregoing figures to one uniform basis, that of 66° Beaume acid (oil of vitriol). As this contains from 93 to 94 per cent of real monohydrate acid (H₂SO₄), the reduction is made by multiplying the pounds of 50° acid by 100-150, and the pounds of 60° acid by 100-120. By so doing we obtain the following results:

Deg.	lbs. made	Eqvy. 66° acid.	Val.
50	948,129,821	632,086,547	\$3,299,707
60	19,078,597	15,888,831	112,540
66	328,101,657	328,101,657	3,110,341

Total

The total quantity of sulphuric acid produced in the United States reduced to a uniform strength of 66° B. is accordingly 976,087,035 pounds, or 488,043 tons of 2,000 pounds each.

Reducing the quantity produced to a uniform strength of 50° B., we have results as follows:

Deg.	lbs. made.	Eqvy. 50° acid.
50	948,129,821	948,129,821
60	19,078,597	22,894,485
66	328,101,657	492,152,455

Total 50° acid manufactured.....\$1,463,176,622
Equal to 731,588 tons.

Supposing all the acid chambers to be running 365 days to the year, we find the amount manufactured in twenty-four hours to be 4,008,703 pounds, or 2,004 tons.

Fertilizers.—From a technical point of view, manufactured manures become the next in importance to sulphuric acid in the category of chemical productions. The total of 1,818,552 tons of these materials produced during the year ending June 30, 1890, indicates by no inaccurate analogy the extent of the farming interests of the country. When we consider that about 300 pounds of artificial fertilizer are commonly used to the acre, it is seen that 12,123,680 acres are enriched by its use. The increase in manufacture and consumption over 1880 is 1,091,099 tons, or about 150 per cent. The figures show with

distinctness that large areas of our country are becoming unprofitable to farm without the use of these aids to fertilization. The existence of factories in the States of California, Illinois, Indiana, Michigan, Minnesota, and Wisconsin, is indicative of the gradual exhaustion of soil that was virgin in character less than twenty years ago. These facts show that the time is approaching with rapid pace when none of our unmanured soils will yield in remunerative quantity. They prove, also, that economies are gradually being practiced in the utilization of material that formerly ran to waste.

In this respect the farmer occupies a reversed position to that of the manufacturer of artificial manures. By prodigal wastefulness and culpable ignorance, he permits immense quantities of manurial matter to find its way to the sea, while bemoaning his lot and sighing over the yield of virgin lands in comparison with that of his own; whereas the manufacturer, by the aid of chemical skill, converts the refuse matter into valuable merchandise. The advance in this branch of manufacture should give encouragement to the farmers of the Atlantic slope. When the distant time arrives for the extinguishment of an agriculture that is based on primordial soil, the lands of these regions will recover their lost value, for observation will show how closely fertility is allied to the production of these manufactured manures, which can be carried on most profitably at those points where supplies of foreign crude material are obtained and where sea-board transportation can be made available.

Soda.—The last decade is rendered memorable to the chemical industry by the permanent establishment of the manufacture of soda salts in the United States. Hitherto all attempts to produce these articles successfully from common salt have failed. The causes that have led to repeated failure and the consequent loss of large sums of money are to be found in the high cost of labor, the absence of customs duties on bleaching powders, or chloride of lime, and the exceedingly low rates of freight that rule in this class of merchandise. The Solvay Process Company, of Syracuse, N. Y., has been founded on the experience and skill of the noted Solvay of Belgium. But, however satisfactory the process may be, it has a defect that enters into the production of many articles in the United States, notably in bleaching, paper-making, and chemical works, inasmuch as all the chlorine of the common salt employed is lost, passing away as valueless chloride of calcium. Consequently the United States still remains dependent upon Great Britain for its supply of so important an article as bleaching powder. A question of the greatest interest centers in this problem, how to overcome this defect in our manufacturing system. The efforts of inventors have, for years, been directed toward the solution. Theory has marked out a number of paths, but practice has not yet succeeded in following any of these to a satisfactory result.

It may be added that, in addition to bleaching powders, the important chemicals, allazrin, chlorate of potash, and chlorate of soda, are not found among the salts produced in this country; and that these articles, so essential to the

textile interests, are free of customs duty.

Pharmaceutical Preparations.—The United States is pre-eminent in the manufacture of pharmaceutical preparations, which are produced in consequence of the demand by physicians for more palatable or more compatible material for the materia medica. These articles cover a large field; they include pills, lozenges, fluid extracts, and a great variety of elixirs. The title, "elegant pharmacy" conveys a correct idea of the position occupied by the industry. Medical substances are associated in the mind with the ad nauseam doses. The producers of pharmaceutical preparations have succeeded, in most instances, in masking or altogether obliterating the unpleasant properties of drugs, which marks an advancement of no small moment within the past twenty years, inasmuch as this tends to improved health, greater security from disease, and a consequent reduction of the death rate. The cost of distilled spirits constitutes the largest outlay in the manufacture of pharmaceutical preparations. A special investigation made by the census office of the United States showed that, during the year ending December 31, 1889, 10,576,842 proof gallons of distilled spirits were consumed in the arts, manufactures and medicine.

Chemicals and Dye-Stuffs Used in the Industry of Dyeing and Finishing Textiles.—In 1890 the value of chemicals used in the independent dye works, bleacheries and print works was \$8,407,693. Much of the dyeing and finishing is, however, done by the manufacturers of the fabrics themselves and the value of the chemicals and dye-stuffs is to be added to the amount named.

There were used by these manufacturers during 1890 the following amounts of chemicals and dye-stuffs:

Woolen mills.....	\$6,453,695
Cotton mills.....	4,226,773
Silk mills.....	558,592

Total\$11,278,970
Adding this \$11,278,970 to the value of the articles used by the dye works, bleacheries and print works (\$8,407,693), we obtain as a grand total of chemicals and dye-stuffs used in manufacturing, dyeing, and finishing textiles, the value of \$19,686,663—nearly \$20,000,000.

Compressed Ammonia Gas, or Anhydrous Ammonia.—The use of this article has reached large proportions within the past few years, and it has proved an invaluable aid to the preservation of food, the refrigeration of malt liquors, and the manufacture of ice. The introduction of the use of anhydrous ammonia has given great impetus to the manufacture of the special machinery adapted to its employment in the departments named. The United States can rightfully claim the inauguration on a large scale of these processes, which at this time yield profit, convenience and health to people throughout the world.

Fuel.—Together with the metallurgical operations of smelting, melting and heating, the chemical industry is a large consumer of fuel, hence great interest attaches to its supply; it is a figure of great importance in computing the costs of these manufactures. Many fuel-saving devices are to be found in chemical works, and within the past two years fuel oil has become of considerable importance. Numerous devices have aided in making

it adaptable in an admirable manner to furnace works. The replacement of coal is likely to be quite marked if the relative prices of the two fuels shall remain at the present ratio. Natural gas has also been utilized in chemical works in localities adjacent to a supply, and its use has proved a great convenience.

Labor and Wages.—The employes of chemical manufacturers range from the lowest order to the highest in the scale, and the wages paid vary in proportion. Many operations partake of the "double shift," or twelve hours, the work being continuous, hence the average paid per hand reaches the high figure of \$50 per week. Eleven dollars and sixty cents per week is the average pay, counting fifty weeks steady employment in the year. A few females and a small number of boys find occupation in this department of manufacture. The men are chiefly of the able-bodied class. The chemical, in comparison with such great industries as iron and steel, woolen and cotton, takes rank as the fourth among these great manufacturing divisions of the country. It represents a diversity of interests such as center in no other department, and it affords to the United States a source of activity for labor, skill and capital, that is highly encouraging to those who have pride in the progress of their country.

The chemical industry of the whole world is interested in and relies upon certain tables or ready reference calculations. These aggregations of figures are confusing to a certain extent owing to the variation of the bases of calculation. In chemical works in the United States tables will be found in use:

For Weights: avoirdupois, apothecary, Troy, metric, as kilograms.

For measure: English gallons, wine, metric, as liters.

For Specific Gravity: Beaume scale, Twaddle.

For Temperature: Fahrenheit, Celsius, Reaumur and Centigrade scales.

Growing out of these different guides we have endless difficulties, unless the writer on a given subject succinctly states by which of the various standards he is governed. The scale of Beaume is rendered confusing at times owing to the difference of the modulus that is accepted. The transmutation of one thermometric scale into another is daily necessary, while errors are frequently made by the difference in the gallon capacity in cubic inches.

The present is opportune for the discussion of this subject with the view of arriving at some deliberate attempt to produce conformity out of this bedlam of figures. The tower of Babel, with its traditional confusion of tongues, may be taken as representing the difficulties arising in chemical work and transactions. A committee consisting of representatives from each nation could be appointed, whose duty it should be to formulate an international system of figures and tables. Uniform methods and statements for these basal calculations would inure to the ease of commercial transactions throughout the world.

The report of Schering's Chemische Fabrik recently made to the shareholders shows the profits for the first ten months of 1893 to be 970,649 marks. The same period of 1892 gave profit of 1,051,168 marks. The Russian tariff war and the fall in silver are given as the causes of the decrease.

PHARMACY.

WEAK SAL VOLATILE brought a fine upon the seller in the Isle of Wight, even though he pleaded that the deficiency in ammonia was due to evaporation of it during the hot weather.

ACID-DIETHYLIDIBENZOYLDIAMIDOTRIPHENYL CARBINOTRISULPHONATE is the pet name for the chemical for which you would inquire if you wished to have green carnations.

NITRATE, NOT NITRITE.—A charge against an English pharmacist for selling spirit of nitrous ether of deficient strength was dismissed, because the summons read ethyl nitrate where it should have been nitrite.

CARBOLIC ACID AS A POISON.—Many suicides occur annually in England in which carbolic acid is used. It is felt that more stringent measures regarding its sale should be enforced, and the proposition to schedule it as a poison is receiving general public support.

BORAX for the treatment of epilepsy has attracted considerable attention of late. Some observers state, however, that its continued use is not so free from harm as has been supposed. Skin troubles, especially of the scalp, result. The hair falls out, but grows again after the stoppage of the borax treatment.

BELLADONNA ROOT contains alkaloids in proportion to its age. When 1 or 2 years old, 0.127 per cent in the spring and 0.452 in summer, the alkaloid being mainly hyoscyamine. A root 8 to 10 years old gave 0.147 in the spring, 0.338 in summer, and 0.230 in autumn. In the leaves of the wild plant in spring and autumn both alkaloids can be detected, while atropine only can be obtained from the mature fruit.

TO DISINFECT SEWERS, WATER CLOSETS, ETC.—Prepare as much quicklime as desired, break it into small pieces and place it in liquid carbolic acid for a quarter of an hour, and preserve in a tightly-closed vessel. If one wish to disinfect a sewer, throw into it a few pieces of lime, which will absorb dampness and send forth any quantity of vapor, impregnated with the carbolic acid, which will penetrate all through the sewer and disinfect it perfectly. Repeat it twice a day.

RESIN OF PODOPHYLLUM.—G. M. Beringer calls attention in *Am. Jour. Phar.* to an error in the *Pharmacopoeia*, where it is stated that ether dissolves 15 to 20 per cent of resin of podophyllum, and boiling water dissolves about 80 per cent and deposits most of it again on cooling. He finds both these statements erroneous and the literature of the subject very confusing. He thinks that properly prepared resin of podophyllum should yield to ether about 80 per cent, and its water solubility should be 22 to 23 per cent.

ALUMINIUM POWDER.—The following mixture is recommended by Prof. Bull for the aluminium flash-light:

Powdered aluminium..... 21.7 parts.
Antimony sulphide..... 13.8 parts.
Chlorate of potash..... 61.5 parts.
All parts by weight.

The three substances should be powdered separately, and the admixture made by shaking well in, say, a paper bag. Grinding the mixture with chlorate of

potash is said to cause a violent explosion. The above burns in about 1-17 of a second. A mixture burning less rapidly is composed of:

Powdered aluminium..... 30 parts.
Chlorate of potash..... 70 parts.
This burns in the fifth of a second.

PRESERVATION OF OLIVE OIL.—One of the great difficulties amongst olive oil manufacturers of the South of France is the preservation of olive oil during summer, and the prevention of rancidness during transport and when it is in the stores. The following process is recommended to prevent deterioration: In the first place, the oil is brought to the liquid state under the influence of a mild heat, after which it must be beaten with 1 per cent of pure oxygenated water. Six hours later this same treatment is repeated, and the next day also. At the end of a long period of rest the oil is poured off and mixed with two per 1000 of methanol. By working according to this method olive oil can be preserved for a comparatively long time, and the inconveniences resulting from the heat of summer are averted.

BISULPHIDE OF CARBON AS AN INSECTICIDE. Farmers and grain dealers suffer from the ravages of weevils and other destructive insects, and to their consideration is recommended the following method of application of carbon bisulphide for the destruction of these pests. Though the vapor of the bisulphide is very light, it has a tendency downward as well as upward, and the plan is to take a small bottle of the carbon bisulphide covered with a cloth and over it placed a wooden box, the whole then being located on the floor of the empty grain bin. The grain is then run in and, after the bin is full, it is surmounted by another portion of the bisulphide arranged in the same manner. The vapor of both bottles so thoroughly permeates the mass of grain that the insects, even rats and mice, are driven away or killed.

IRON ALBUMINATE.—A process which has been granted a German patent is described by L'Un. *Phar.* thus: 100 parts of egg albumen are made into solution with 2,000 parts of distilled water. To the liquid is added a solution of 25 parts of iron tartrate in 250 parts of distilled water, and just neutralized with 10 per cent solution of soda. Next, a solution of 10 parts of neutral sodium tartrate in 90 parts of water is added, and finally 38 parts of 10 per cent soda solution. The result is a muddy, yellowish-brown mixture, which is maintained at a temperature of about 90° C. for from 2 to 4 hours, or until it has become limpid. Tartaric acid is then added in solution, after cooling, until an acid reaction is apparent. The mixture is then made distinctly alkaline with ammonia, and maintained for 24 hours at 90°. It is then cooled, again made acid with tartaric acid, when a precipitate of iron albuminate is thrown down, which is thoroughly washed on the filter and purified by dissolving in 1,400 parts distilled water, mixed with 20 parts of 25 per cent ammonia and 20 parts of a 10 per cent solution of neutral ammonium tartrate and heated at 90° C. for 48 hours. The albuminate is then finally precipitated by tartaric acid, washed until all acid reaction has disappeared, and carefully dried.

NEW REMEDIES.

DERMASOT, sold as a remedy for sweaty feet, is said by Ch. & Dr. to be a solution of acetate of aluminum colored with fuchsin and flavored with acetic ether.

OZALIN is a fancy name for a new disinfectant, which Br. & Col. Dr. says is apparently nothing more than calcium, magnesium and iron sulphates with burnt lime and magnesia.

PHENYLXYLID-ETHANE is a recently produced disinfectant which seems to be merely a complex mixture of the sulphonic acids of this body and its homologues combined with potash.

THERMODIN is claimed to be of service as a temperature reducer in cases of typhus fever, etc. It is acetyl-ethoxyphenylurethane, and occurs in white, odorless crystals, almost insoluble, melting at from 86° to 88° C.

SALUMIN.—Riedel presents this new remedy for approval, claiming special advantage for it in the treatment of inflammatory conditions of the throat and nose. It is found to be a salicylate of aluminum.

ASAPROL and quinine salts are incompatible, when mixed in solution a resinous body appearing on the surface of the liquid. This resinous product is soluble in 90 per cent alcohol, but insoluble in water.

SANGUNAL is advocated as a blood forming medication. It is described as containing 10 per cent oxyhaemoglobin, 46 per cent of the salts existing in the blood, and 44 of freshly peptonized muscular albuminoids.

CARBOL-VASELINE.—Ap. Zig. describes the manufacture of this antiseptic salve. Vaseline is subjected to prolonged heating at 120° C., to thoroughly sterilize it, and then is mixed with carbolic acid, finally being poured while hot into tubes, which are to be hermetically sealed.

RESOL is a new disinfectant of German production, produced by treating 1,000 parts of wood tar with 9 parts caustic potash and adding 200 parts of wood spirit or other indifferent substance. It is said to be an active bactericide, being effective in 3 per cent solution.

TANNAL AND GALLAL are two new products from the house of Riedel, being respectively tannate and gallate of aluminum. The most soluble form of tannal is a double salt with tartaric acid, which is given the name of "soluble tannal," while the "soluble gallal" is its double combination with ammonia.

CREOSOTAL is creosote carbonate, a thick liquid, neutral in reaction, insoluble in water, soluble in 4 or 5 parts of cod-liver oil or olive oil, contains 90 per cent pure creosote, rich in guaiacol, and is administered best in an emulsion with the yolk of an egg, in daily doses of from 1 to 6 grams for a child and from 4 to 15 grams for an adult.

NEURODIN is a new synthetic remedy vaunted as a remedy for neuralgia. It appears in white, odorless crystals, of a melting point of 87° C., and of very slight solubility in water, about 1 in 1,400. Chemically, it is announced as acetyl-p-oxphenylurethane. It is given in doses of from ½ to 1½ grams. Its principal effect is reduction of temperature, which has been observed to be from 2¼ to 3 degrees.

KAMAREZITE.—At a recent session "of the Lower Ithenish Scientific and Medical Society, Dr. Buzz exhibited a new mineral named kamarezite, from the circumstance that it was discovered at Kamarez, in Attica. Kamarezite, which is related to fangite, is a cupric sulphate, remarkable for the very large quantity of water of crystallization it contains."

ANTHRICUMATIN is advocated for employment in cases of acute rheumatism. It is a combination of salicylate of sodium and methylene blue, occurring in dark blue crystals, soluble in water and alcohol, and of slightly bitter taste. It is given in pills in doses of from 1-20 to 1-10 grain every two hours. In passing through the body the methylene blue is decomposed and the urine is colored green.

CAFFEINE SULPHONATES are recommended as excellent remedies in the treatment of dropsy, being safe and unobjectionable diuretics. The sodium, lithium and strontium sulphonates have been placed upon the market under the names respectively of Symphorol N., Symphorol L., and Symphorol S. The sodium sulphate also appears under the title of Nasrol. It has a bitter taste, is very soluble in boiling water, but only slightly soluble in cold water.

IDOCAFFEINE is produced through dissolving in sufficient cold water 65 parts of caffeine iodide and 35 parts sodium iodide, passing hydrogen sulphide through the solution, and finally evaporating to dryness. Iodotheline is obtained in a similar way, but the preparation of iodotheobromine is a little more difficult. To a solution of sodium iodide and theobromine is added a concentrated solution of salicylic acid. The nature of these compounds has been studied and it has been found that they exert special action on the heart. Not particularly scientific combinations.

TRIKRESOL is a new antiseptic from Schering. It is a concentrated preparation of cresols intended to take the place of carbolic acid. It is a water-white, clear liquid, of creosote-like odor, soluble in water to the extent of 2.2 to 2.55 per cent, a solubility which allows of its administration in 1 per cent solution, which is as high as is ever required in surgical practice. If, however, stronger preparations are desired, they can be made with the aid of soap, alkali, etc. Frankel and Gruber show that the 1 per cent solution of trikresol is equal to a 3 per cent carbolic acid solution in disinfecting value. Trikresol is claimed to contain no carbolic acid, being composed of the meta, ortho and para cresols in the proportion of 40, 35 and 25 per cent respectively. It has the advantage over carbolic acid of being non-toxic.

THIOSAPOL is the name of a soap which contains sulphur in chemical combination. Thiosapol-sodium, containing 10 per cent of sulphur, is made by heating together 120 grams of sulphur and 1 kilogram oleic acid. The product is then thoroughly mixed with 600 grams of 25 per cent solution of soda and the excess of the liquid removed by evaporation. The sulphurated oleic acid may also be dissolved in 2 kilograms of 90 per cent alcohol, saponified by 430 grams of 35 per cent solution of soda, and the filtrate evaporated to dryness at 50° C. Thiosapol-cocconut-oil soap is made by heating to-

gether 100 grams of sulphur and 1,000 grams linseed oil until a clear solution is produced, and 1 kilogram of this product is melted with an equal quantity of coconut oil, cooled to 25° C. and then incorporated with 1 kilogram of 35 per cent solution of soda and left to stand until complete saponification takes place.

SALICYLIDE-CHLOROFORM.—Chloroform possesses the property of combining with salicylide to form a solid body, easily decomposable. Some time ago Anschuetz proposed to prepare chloroform by decomposing this body. Ch. & Dr. reports that he has not allowed the matter to drop, and we find corroboration of this in a recent statement in Pharm. Zeitung. At a meeting in Bonn he described the method of preparing the combination. On treating salicylic acid in toluol solution with phosphoric chloride, both salicylide and polysalicylide are formed, the former having a melting point of 260° to 251° C., and the latter 322° to 325° C. These two bodies are easily separated, polysalicylide being practically insoluble in boiling chloroform, while salicylide combines with it to form the compound salicylide-chloroform, containing 33.24 per cent of chloroform. Anschuetz believes the decomposition of this substance to be the means of obtaining pure chloroform, for the impurities which may be associated with the anaesthetic do not combine with salicylide, so the double compound can be freed from even traces of them by decomposition.

MORPHINE IN EXTRACT OF POPPY.—Paul & Cowley (Phar. Jour.) have examined some samples of extract of poppy and found great variation in the amount of morphine present. In the five samples under examination, percentages reported were respectively 0.72, 1.34, 1.61, 0.77, 1.14. From these results it is seen that when syrup of poppy is made from poppy extracts without reference to the amount of morphine they may contain, the preparation is liable to be twice as strong in some instances as it is in others.

ESENCIA DE CALISAYA.

A correspondent sends us the following formula for this preparation:

Cinchone muriate.....	2 ozs. 25 grs.
Quinine sulphate....	1 oz. 12½ grs.
Cinchonidine.....	1 oz. 12½ grs.
Sugar.....	40 pounds.
Cologne spirits.....	2½ pints.
Oil bitter almonds.....	30 minims.
Oil neroli.....	40 minims.
Oil cassia.....	25 minims.
Tincture vanilla.....	10 fl. ounces.
Tincture cudbear.....	2 ozs. 260 min.
Caramel.....	2 ounces.
Water, q. s.....	10 gallons.

ARTIFICIAL RUM.

A German journal gives the following recipe for producing a delicious imitation of Jamaica rum:

Roasted leather scrap- ings.....	2,000 parts.
Oak bark.....	500 parts.
Orange peel.....	20 parts.
Jamaica pepper.....	20 parts.
Catechu.....	20 parts.
Vanilla.....	20 parts.
Cloves.....	20 parts.
Spirit of wine.....	10,000 parts.

Chem. & Drug. is not very sanguine of the deliciousness of this concoction.

NITRIC ACID. Dunstan claims, is best represented by $H_2O \cdot N_2O_6$, not HNO_3 .

EXAMINATION QUESTIONS.

This department is for the publication of questions and answers from our readers; the market being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We solicit questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA,
Box 583, Detroit, Mich.

SERIES NO. 1.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue. Replies should reach us not later than March 15th, 1894.

1. Give meaning of the term evaporate, and state the difference between evaporation and distillation.
2. What is the difference between a sediment and a precipitate.
3. Give the official fluid or liquid measures, their abbreviations, and their equivalents in minims. (By "official" is understood, S. P.)
4. What is the official thermometer? Why is mercury especially adapted for use in thermometers? Convert—10° R. into degrees temperature official standard.
5. Write a prescription for a four-ounce emulsion containing 25 per cent of castor oil. Give all the ingredients to make an agreeable and homogeneous mixture, with directions for compounding.
6. What significance is attached to the terminations ate and ite in the nomenclature of salts?
7. Define fermentation. What is a ferment? Give examples (pharmacopoeial) of the products of fermentation.
8. How would you distinguish between morphine and quinine? Between corrosive sublimate and calomel?
9. Two ounces of distilled water at 15° C. will dissolve how many grains of each of the following? Potassium chlorate? Boric acid? Epsom salt?
10. State the difference between annual, biennial and perennial plants, and give an example of each.

AS A CURE FOR LIGHTNING

STROKE, the following is decidedly unique: A bed-ridden invalid in Austria suffered a stroke, which entered his body through the metal of a truss which he was wearing. The inhabitants of the village, under the impression that the lightning had remained concealed somewhere in his body, removed him forcibly from the bed, stripped him and buried him, all but the head, in a hole, which was then refilled with earth. The poor man remained in this unpleasant predicament until he was rescued by a medical man. We are not yet informed by our authority for this story (Chem. and Drug.) whether the method of cure was effective.

MEYER BROS.' DRUGGIST comments pertinently upon the fact that there are 40 or more institutions for instructing pharmacists in this country by quoting Jules Simon, who observes: "When I was young, we prepared students for life, now we prepare them for examination."

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.
Requests for information are not acknowledged by mail and ANONYMOUS COMMUNICATIONS RECEIVE NO ATTENTION. To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

5922. Spirits Thymol Compound.

(M. J. G.) See reply to query No. 5682, Nov. 1, 1893, page 408.

5923. Aromatic Fluid Extract Casca-Sagra Sagrada.

(M. J. G.) See formula given in reply to query No. 5782, page 501, Dec. 1, 1893, Era.

5924. Chamomilla Compound.

(Oneida.) This is a preparation which the manufacturers state to be a "mixture of the mother tinctures of cinchona, chamomilla, ignatia and phosphorus, combined with aromatics, after the formula of Dr. T. A. McBride."

5925. Elixir Cerasein Compound.

(J. H. L.) This preparation is stated to contain "cerasein," quinine and gelsemin. Just what is meant by "cerasein" we cannot say, though some manufacturers list a so-called "concentration," obtained from choke cherry, under that name.

5926. Leontine.

(Oneida) is a preparation, manufactured by Lloyd Bros., Cincinnati, O., on the label of which they state it to be an aromatized liquid containing 1 per cent of the isolated glucoside of blue cohosh, and to be useful in amenorrhoea and dysmenorrhoea.

5927. "Iron Tonic."

(C. G.) The importance of the preparation sent renders it inadvisable to make more than a superficial examination. This examination shows it to be a very heavy syrup in which is dissolved an iron salt, most likely ferric phosphate, and the syrup made darker by the use of caramel.

5928. Ducros' Elixir.

(C. G.) We have a distinct recollection of having recently seen a supposed formula for this preparation, but a pretty thorough search has failed to reveal it. Your indulgence is asked for a short time. It is advertised as being a combination of alcoholic stimulants and the nutritious properties of raw meat, and to have been used with success in Parisian hospitals.

5929. To Preserve Lemons and Leaves.

(B. & R.) Inquire how to preserve in a glass jar lemons and leaves intact, without destruction of their color. The use of alcohol is objectionable. There seems to be no definite formula for application in a case of this kind. Possibly an antiseptic solution containing, say, salicylic acid, might do the work, but we doubt it. We would like the opinions of our readers upon this subject.

5930. Granular Effervescent Salts.

(W. A. L.) In the December 1, '93, Era was published an article upon the preparation of these salts, with formulas and working directions. The instructions there given are well qualified to give successful results if carefully followed, and it is an easy matter to devise the appar-

atus you need for the quantities worked with. Your query seems to be abundantly covered by the paper in question.

5931. Compound Elixir of Fir.

(M. R. B.) Try this:
 Fluid extract tamarac bark..... 2 fl. ounces.
 Fluid extract white pine bark..... 1 fl. ounce.
 Fluid extract balsam fir bark..... 1 fl. ounce.
 Purified talcum..... 2 drams.
 Aromatic elixir N. F. 30 fl. ounces.
 Mix the fluid extracts with the aromatic elixir. Incorporate the purified talcum thoroughly with the mixture, allow it to stand for 12 hours, occasionally agitating, and filter through a wetted filter. Dose, 2 to 4 fluid drams.

5932. Family Tea.

(C. L. G.) We cannot give you the exact formula for these proprietary teas, but as a rule they are made up of crude drugs after the manner of the species or "Tea Mixtures" of the German Pharmacopoeia. A tea similar to that you mention is said to contain althaea, licorice, senna, couch grass, etc. If you will try the following formula we think you will produce an article which will give you excellent satisfaction: Moisten 25 parts of cut senna with a small quantity of water, and sprinkle over it as uniformly as possible five parts of bitartrate of potassium, allow to dry and then mix lightly with four parts each of althaea, licorice root, anise, fennel and couch grass, all bruised and cut to suitable size.

5933. Grains of Health.

(Oneida.) Dorvault's L'Officine gives the following formula on the authority of Cadet de Gassicourt:

Aloes..... 100 parts.
 Jalap..... 100 parts.
 Rhubarb..... 25 parts.
 Syrup absinthie, a sufficient quantity.

Make into pills weighing 0.1 gram each and coat with silver. Dorvault also states that according to Guibort, these pills are composed simply of aloes and extract of glycyrrhiza dissolved by the aid of heat and evaporated to a pilular consistence. Others claim they have found them to contain oxgall and tartar emetic.

5934. Headache Powders.

(M. T. A.) The following are suggested:

(1.)
 Acetanilid..... 3 grains.
 Caffeine..... ½ grain.
 Bicarbonate soda..... 3 grains.
 Make one pill, powder or wafer.

(2.)
 Acetanilid..... 3 grains.
 Salicylate soda..... 3 grains.
 Caffeine..... ½ grain.
 Make one capsule or wafer.

(3.)
 Acetanilid..... 3 grains.
 Salicine..... 4 grains.
 Caffeine..... ½ grain.
 Make in a capsule or wafer.

5935. Asthma Remedy.

(A. C. R.) The formula you name has never been published, so far as we are aware. A serviceable preparation for internal administration may be made after the following formula:

Potassium iodide..... 4 drams.
 Tincture belladonna..... 4 fl. drams.
 Spirit of ether..... 4 fl. drams.
 Fluid extract grindelia. 1 fl. ounce.
 Syrup of sarsaparilla compound, enough to make..... 4 fl. ounces.

Dose, teaspoonful, 3 or 4 times a day. See also formula No. 5396 in the Sept. 15, 1893, Era, page 251, and formula No. 5769, Dec. 1, 1893, Era, page 500.

5936. Chloro-Naphtholeum.

(L. Bros.) This is a compound which its manufacturer, R. S. West, of Cleveland, advertises for use in disinfecting drains, sinks, etc., and for the prevention of offensive odors. It is said to be made of creosote oil combined with alkali in such a way as to mix readily with cold water, and is further claimed to be non-poisonous, though acting as a good insecticide. We learn that it has considerable employment by agriculturists for application to animals to keep insects from them. It is made into about a 20 per cent solution and the animal thoroughly washed with it. Its exact composition is not disclosed, though from what is said of it, it is probably a cresol preparation.

5937. Elixir Digestivus Compound.

M. J. G.) The following formula has been communicated to the sub-committee of the A. P. A. on additions to the National Formulary:

Pepsin, soluble scales. 300 grains.
 Pancreatin..... 30 grains.
 Ptyalin, or diastase of malt..... 30 grains.
 Lactic acid..... 85 minims.
 Glycerin..... 16 fl. ounces.
 Water..... 8 fl. ounces.
 Tincture persicinis, N. F. 2½ fl. ounces.
 Talcum purified..... 1 ounce.
 Aromatic elixir, enough to make..... ½ gallon.

Add the acid to the water and glycerin, and to this mixture add the pepsin, pancreatin and diastase, and macerate until apparently dissolved. Then add the tincture persicinis and enough aromatic elixir to make 4 pints. Thoroughly incorporate the purified talcum and filter through paper.

5938. Liquid Flesh Color.

(E. W. M.) There are various pigments and coloring agents used in preparations of this kind. Here are two formulas taken from the Era Formulary:

Eosin..... 4 parts.
 Distilled water..... 80 parts.
 Glycerine..... 20 parts.
 Eau de cologne..... 300 parts.
 Spirit..... 400 parts.
 Dissolve, allow to stand and filter. According to desire, the proportions of eosine may be increased or diminished, or modified with aniline orange.

(2.)
 Water of ammoniac..... ½ ounce.
 Carmine..... ¼ ounce.
 Rose water..... 1 pint.
 Essence of rose..... ½ ounce.
 Glycerine..... 1 ounce.

5939. Menthol Liniment.

(C. C.) Here are several formulas:

(1.)
 Menthol 2 drams.
 Camphor 2 drams.
 Chloroform 2 ounces.
 Alcohol 2 ounces.

(2.)
 Menthol 1 dram.
 Oil cloves..... 1 dram.
 Oil sassafras..... 1 ounce.
 Chloroform 2 drams.
 Alcohol 1 ounce.
 Soap liniment, enough to make..... 4 ounces.

(3.)	Menthol	5 grams.
	Olive oil	45 grams.
	Lime water	50 grams.

(1.)	Menthol	3 parts.
	Chloroform	4 parts.
	Olive oil, enough to make	16 parts.

5940. Prescription Criticism.

(J. G. G. and M. C. B.) send in the following prescription for criticism:

Spirit nitre	16 ounces.
Balsam copaiba	8 ounces.
Canada balsam	4 ounces.
White honey	17 ounces.
Fluid extract cubeb	2 ounces.
Fluid extract buchu	2 ounces.
Fluid extract gelsemium	2 ounces.
Fluid extract checker-berry	2 ounces.
Ferri-ferrocyanuret	¼ ounce.
Potassium iodide	½ ounce.

One teaspoonful every hour until relieved.

This prescription is a good sample of a shotgun combination, and in whatever way dispensed would be anything but elegant. As to the chemical chances likely to take place no one can definitely determine. Spirit nitre is incompatible with potassium iodide and also with the astringent principles of the fluid extracts. Ferri-ferrocyanide is also likely to be decomposed.

5941. Blood Syrup Containing Potassium Iodide and Iron.

(E. J. F.) Perhaps no better preparation can be devised than a combination of potassium iodide and tincture of iron with compound syrup of sarsaparilla. Other alternatives may also be combined with the mixture. Try the following:

Potassium iodide	320 grains.
Tincture of iron	256 minims.
Water	2 fl. ounces.
Fluid extract burdock	2 fl. ounces.
Compound syrup sarsaparilla	8 fl. ounces.
Syrup enough to make	16 fl. ounces.

Here is a formula for a preparation, though not a syrup, has been very highly recommended as a "blood purifier."

Potassium iodide	90 grains.
Ferric phosphate	90 grains.
Sugar	1 ounce.
Fluid extract stillingia	2 drams.
Fluid extract yellow dock	3 ounces.
Fluid extract sarsaparilla	3 ounces.
Alcohol	3 ounces.

See also reply to query No. 5915 in the Jan. 15th issue, page 63.

5942. Koch's Tuberculin.

(S. B.) So far as has been authoritatively made known, tuberculin is a glycerin extract of a pure cultivation of the tubercle bacillus, and as stated by Dr. Koch, its therapeutic value is due to one active principle that is present in it to the extent of only a fraction of one per cent. In an investigation reported by Dr. Hunter in the Brit. Med. Jour. results were obtained with it that tended to show that the characteristic symptoms following the injection of tuberculin are due to three constituents at least, and that its principal constituents are albumoses (chiefly protoalbumose and deutoalbumose, together with some heteroalbumose, and occasionally a trace of dysalbumose), alkaloidal substances,

extractives of unrecognized nature, mucin, inorganic salts, glycerine and coloring matter.

Of course it would be impracticable for you to make the article, but it can be purchased in the market.

5943. Interstate Registration.

(A. H.) asks whether the Michigan Board of Pharmacy recognizes the certificates granted by the New York State Board of Pharmacy. The interchange of certificates is one of mutual agreement between the different boards. We do not believe such an arrangement exists between the Michigan Board of Pharmacy and that of New York. A licentiate of the Michigan Board of Pharmacy can be retested without further examination upon paying the required fee and furnishing a certificate from the secretary of that board that he passed the examination 5 per cent higher than was actually required. In Wisconsin, Minnesota, North and South Dakota, Washington, and Missouri. This arrangement is reciprocal, the Michigan Board recognizing the certificates granted by the Boards of Pharmacy in each of the states named. For further information write to Stanley E. Parkill, secretary of the Michigan Board of Pharmacy, Owosso.

5944. Anhydrous Lanolin.

(M. M.) This is the Adeps Lanae of the B. P. Ad. defined in that work as the purified cholesterolin-fat of sheep's wool, without the addition of water. It is officinally described as a yellowish tenacious unctuous substance; almost odorless; with a melting point varying from 100 degrees F. (37.8 degrees C.) to 112 degrees F. (44.4 degrees C.), readily soluble in ether and chloroform, sparingly soluble in rectified spirit. It takes up more than its weight of water, part of which separates out gradually, the remainder, about 30 per cent, being retained by the wool fat, with which it forms the Adeps Lanae Hydrosus of the U. S. P. and B. P. Ad. It is prepared from the washings of sheep's wool by a process which has been patented, or it may be procured by treating the wool with petroleum benzine and distilling off the benzine. The latter process has met with objection on account of the difficulty experienced in getting rid of the benzine odor. A list of tests for Adeps Lanae may be found in the B. P. Additions of 1890.

5945. Palatable Castor Oil.

(Oneda.) Every pharmacist has some little dodge of his own for rendering castor oil palatable, but it is said it may be accomplished to satisfaction by repeatedly treating it with hot water, and the addition of saccharin, until it tastes like a thin syrup. Then small quantities of the aldehyde of Ceylon cinnamon oil and some essence of vanilla are added until all traces of the scratching taste disappear.

Here is another process which may prove acceptable: Take of pitted gum arabic, 54 grams, and orange flower water, 142 grams. Make a thick mucilage with a portion of the water, and in a marble mortar mix it with 152 grams of fresh castor oil until perfectly mixed. Then add 156 grams finely powdered sugar, the remainder of the orange flower water, and 8 grams of cinnamon oil. After mixing thoroughly, raise it by gentle heat to the boiling, then cool, skim and preserve.

5946. Tooth Paste for Collapsible Tubes.

(O. S.) The following are taken from the Era Formulary:

(1.)	Precipitated chalk	8 ounces.
	Powdered cattle bone	2 ounces.
	Powdered castile soap	2 ounces.
	Carmine, No. 40 in fine powder	1 dram.
	Oil cloves	20 minims.
	Oil nutmeg	20 minims.
	Oil bitter almond	10 minims.
	Oil rose	5 minims.
	Alcohol, glycerine, honey, or syrup and water, of each	5 minims.

Beat the soap first with the water, and warm until softened, then add the remaining liquids and mix well together. In this incorporate the solid ingredients and put into the tubes.

(2.)	Honey	½ pound.
	Precipitated chalk	¼ pound.
	Powdered orris root	¼ pound.
	Carmine	2 drams.
	Oil cloves	¼ dram.
	Oil nutmeg	¼ dram.
	Oil rose	¼ dram.
	Simple syrup, enough to form a paste.	

5947. Indelible Ink.

(Student.) The following are taken from the Era Formulary:

(1.)	Silver nitrate	50 grains.
	Tartaric acid	40 grains.
	Carmine, No. 40	5 grains.
	Water of ammonia	½ ounce.
	Mucilage gum arabic	½ ounce.

Dissolve the silver nitrate in the ammonia, and add the tartaric acid; then rub the carmine with the solution. Lastly, add the mucilage. This ink is red when first written with; on the application of heat it soon changes to black.

(2.)	Silver nitrate	125 parts.
	Water of ammonia	250 parts.
	Soda (commercial)	175 parts.
	Mucilage acaela	375 parts.
	Boiling water	125 parts.

Dissolve the silver nitrate in the water of ammonia, and separately the soda in the boiling water and mix; add the mucilage and set in the sun until the mixture becomes brown.

(3.) Here is a formula for red indelible ink. Make three solutions, as follows:

(a.) Dissolve 3 drams of sodium carbonate and gum arabic in 12 drams of water.

(b.) Dissolve 1 dram platinum chloride in 2 ounces of water.

(c.) Dissolve 1 dram stannous chloride in 4 drams distilled water.

Moisten the place to be written upon with solution (a) and dry with a warm iron. Then write with (b), and when dry moisten with solution (c).

5948. Removing Indelible Ink Stains.

(Student.) The staining principle of ordinary indelible ink is nitrate of silver, and may be removed in several ways:

(1.) Apply to the stain a solution of 10 grains of cyanide of potassium and 5 grains of iodine in an ounce of water; or a solution of 8 parts each of bichloride of mercury and muriate of ammonium in 125 parts of water. Care should be exercised in handling these solutions, as they are both poisonous.

(2.)

A solution of iodide of potassium will freely dissolve iodine. Silver stains moistened for a while with this solution will be converted into iodide of silver, which is soluble in excess of the potassium iodide. The stains will have disappeared when the cloth, after the foregoing treatment, is washed in water.

Here is a process taken from the Era Formulary:

Chloride of copper completely removes, even from colored woven cotton tissues, stains occasioned by nitrate of silver; the tissue is afterwards washed with a solution of hypo-sulphite of sodium, and next thoroughly washed with water. From white cotton and linen tissues, the stains are more readily and effectually removed by applying dilute solution of permanganate of potassium with hydrochloric acid, followed by washing with hypsulphite of sodium solution, and rinsing in plenty of fresh water.

59.0. Shellac In Waterproof Ink.

(Subscriber.) The following is said to be a satisfactory formula: Shellac 15 parts, borax 8 parts, gum arabic 8 parts, lamp black 10 parts, water 130 parts. Add the water to shellac and borax, both finely pulverized, and boil with constant stirring until all the shellac is dissolved. Filter the solution through blotting paper. Mix the gum arabic, in fine powder, with the lamp black in a mortar. Put the mixture of gum arabic and lamp black into the vessel used for boiling the shellac, borax, and water, and after pouring some of the filtered fluid over it, heat to boiling. When all the gum arabic is dissolved, gradually add, with constant stirring, the rest of the fluid, and set the whole aside for a few days to allow the coarser particles of the lamp black to settle. The finished ink is carefully decanted, or siphoned off from the sediment.

A very resistant writing fluid is also obtained by simply boiling shellac with water, the lamp black being only added to impart a darker color to the ink. As a substitute for the lamp black, the decoction of shellac and borax may, after filtering, be mixed with a corresponding quantity of indigo-carmine, or of a very concentrated logwood chrome ink.

59.50. Glass Stoppers, To Loosen.

(W. H. H. S. & S.) Here are several methods, one of which is certain to prove effective:

(1.) Hold the bottle or decanter firmly in the hand or between the knees, and gently tap the stopper on alternate sides, using for the purpose a small piece of wood, and directing the strokes upward.

(2.) Plunge the neck of the vessel in hot water, taking care that the water is not hot enough to split the glass. If the stopper is still fixed, use the first method.

(3.) Pass a piece of lint around the neck of the bottle, which must be held fast while two persons draw the lint backwards and forwards.

(4.) Warm the neck of the vessel before the fire and when it is nearly hot the stopper can be removed.

(5.) Put a few drops of glycerine or oil around the stopper where it enters the glass vessel, which may then be warmed before the fire. Then apply process No. 1. If the stopper still continues immovable, repeat the above process until it gives way, which it is almost sure to do in the end.

4.) Take a steel pin or needle and run it

around the top of the stopper in the angle formed by it and the bottle. Then hold the vessel in your left hand and give it a steady twist toward you with the right, and it will very soon be effectual. If this does not succeed, try process No. 5, which will be facilitated by it.

59.51. Books on Grasses, Fungi and Insects.

(L. S.) The various contributions from the U. S. National Herbarium, published by the authority of the Secretary of Agriculture, Washington, contain much information regarding the subject of grasses and fungi. Among these may be mentioned a "Monograph of the Grasses of the U. S. and British America," by Dr. Geo. Vasey, issued by the department February 25, 1892; Bulletin No. 12, "Grasses of the Southwest," part I. issued October 13, 1890, and part II. issued December 1, 1891; Bulletin 13, "Grasses of the Pacific Slope," part I. issued October 20, 1892, and part II. issued June 1, 1893. The Agricultural Department has issued other literature upon the subject, information concerning which may be obtained by addressing the Botanist, Department of Agriculture, Washington. A work of considerable value, not published by the government, is "The True Grasses," by Edward Hackel, translated from Die Natürlichen Pflanzen familien (Engler and Prantl), by F. Lamson-Scribner and Effie A. Southworth. For a list of books upon the fungi of the U. S., see reply to query 112 in the Apr. 15, 1893, Era, page 350. In connection with the books there named may be mentioned "Handbook of Mosses of N. E. America," by Mrs. E. G. Britton; also Macoun and Kindsberg's "Catalogue of Canadian Plants," part VI., "Musci," a work of some 300 pages, published by the Geological and Natural History Survey of Canada. For information regarding books upon insects, etc., write Dr. C. V. Riley, Entomologist, Department of Agriculture, Washington, D. C.

59.52. Mucilage of Irish Moss.

(M. B.) We can suggest no better formula than the alternative process given in the National Formulary. As stated in the note appended to the formula, the mucilage may be made clear by diluting it when freshly made and still hot, with about 3 volumes of boiling water, filtering and then evaporating the filtrate to a volume corresponding to the proportions used. In 187 Emien Painter, in a paper read before the American Pharmaceutical Association, described some experiments made by him with a view of producing Irish moss gelatin suitable for any purpose for which the gelatin is useful. The apparatus consisted of a cylindrical metallic percolator, 18 inches high, tapering slightly, from 4 to 6 inches in diameter, and surrounded by a water-jacket. The lower extremity of the percolator terminates in a tube $\frac{3}{8}$ in. in diameter, which is bent at right angles and passes through the side of the water-jacket, the tube terminating in a $\frac{3}{8}$ -inch bibb. A conical shaped bag made of cheese cloth, of about one-half the capacity of the percolator, is filled with selected Irish moss, previously washed in cold water. The bag is then suspended in the percolator, the water-jacket and percolator both filled with water, and the apparatus placed over the fire. After being kept at the boiling temperature for about two hours the bibb is opened and the clear, mucilaginous liquid drawn off,

which, upon evaporation and spreading upon plates of glass, yields a beautiful, transparent gelatin. This gelatin, when dissolved in water, makes a perfectly clear mucilage and one claimed by its author to be in every way satisfactory.

59.53. Orange Cider.

(C. B. H.) The following process has been recommended: Express the juice of sweet oranges, first crushed and allowed to macerate over night, adding an equal quantity of water and one pound of sugar or glucose for each gallon of juice (or two gallons of diluted liquid), allowing it to stand in a vessel covered so as to exclude the air, but with an opening to allow the escape of carbonic acid gas formed during the fermentation. The mixture should be kept in a moderately warm temperature (89°-90° F.) until the fermentation is completed, when the clear liquid is drawn off and preserved in tightly stoppered vessels.

Here is another process: Boil 40 pounds of sugar for $\frac{1}{4}$ hour with 13 $\frac{1}{2}$ gallons of water. At the same time press and filter the juice of 75 oranges and mix it, together with the rinds, with the sugary fluid after the latter has been cooled off to about 85° F. The mixture is then poured into a cask and frequently stirred during 3 or 4 days, when the cask is bunged and placed in a cellar for six months, when the clear liquid is drawn off.

The following formula for a similar product, under the name of "orange wine," is taken from the Cyclopedia of Receipts: The oranges must be perfectly ripe. Peel and cut them in halves crosswise of the cells; squeeze into a tub. The press used must be so close that the seeds cannot pass into the must. Add 2 pounds white sugar to each gallon sour orange juice, or 1 pound to each gallon sweet orange juice, and 1 quart water to each gallon of the mixed sugar and juice. Close fermentation is necessary. The resultant wine is amber-colored, and tastes like drk hock, with the orange aroma. Vinegar can be made from the refuse, and extract from the peels.

59.54. Camphor Cream.

(Kenilworth.) Several different kinds of preparations are put up under this title, the following being representative formulas:

(1.)

Quince seed, in coarse powder.....	60 grains.
Hot water.....	14 fl. ounces.
Borax, powdered.....	60 grains.
Glycerin.....	2 fl. ounces.
Spirit camphor.....	1 fl. ounce.
Oil bitter almond.....	10 minims.

Macerate the quince seed for half a day with the water and strain. Mix with the glycerin. Dissolve the oil bitter almond in the spirit of camphor and gradually add to it the mucilage of quince, etc., and mix thoroughly.

(2.)

Camphor.....	6 drams.
Oil turpentine.....	6 drams.
Ammonium chloride.....	12 drams.
White castile soap, in shreds.....	12 drams.
Water of ammonia.....	1 $\frac{1}{2}$ ounces.
Distilled water.....	12 ounces.

Dissolve the soap in half of the water, with the ammonia, and the ammonium chloride in the other half of the water. Then mix the two solutions, add the camphor previously dissolved in the turpentine, and shake briskly until a perfect emulsion results.

(3.)	White wax.....	2½ troy ounces.
	Spermaceti.....	2½ troy ounces.
	Camphor.....	1½ troy ounces.
	Oil sweet almond.....	16½ fl. ounces.
	Distilled water.....	9 fl. ounces.
	Borax.....	75 grains.
	Coumarin.....	3¼ grains.
	Oil of Rose.....	22 minims.
	Oil French geranium.....	5 drops.
	Oil ylang ylang.....	5 drops.
	Oil bitter almond.....	2 drops.
	Oil orris.....	1 drop.
	Tincture musk.....	10 drops.
	Tincture civet.....	5 drops.

5555. Syrup Chloride of Iron.

(S. B.) The French Codex directs the syrup of ferric chloride to be made by the addition of 15 parts of solution of ferric chloride, F. P., to 985 parts of syrup. Twenty grams of this syrup contain 10 centigrams of ferric chloride. It should be prepared extemporaneously.

Hager gives the following under "Syrupus Ferri Sesquichlorati":

Ferri sesquichlorati crys. 5 grams.
Syrupus sacchari.....1,000 grams.

This formula contains 8 parts of ferric chloride in 1,000 parts of finished product, while the preparation of the Codex contains only 5 parts.

One of our exchanges suggests the following formula for tasteless syrup of chloride of iron, representing approximately 40 drops of the tincture of ferric chloride to the ounce of finished product.

Tincture ferric chloride..... 1 fl. ounce.
Sodium citrate..... 1¼ troy ounces.
Water..... 6 fl. ounces.
Sugar..... 9 troy ounces.
Syrup, enough to make..... 16 fl. ounces.

Mix the tincture of ferric chloride with the water and dissolve in this mixture the sodium citrate and sugar with the aid of heat. When cold add sufficient syrup to make 16 fluid ounces.

A syrup of ferrous chloride may be made by the following method:

Solution ferric chloride..... 320 minims.
Glycerin..... 4 fl. ounces.
Syrup, enough to make..... 16 fl. ounces.

Mix and expose to the sun until entirely colorless. Three or four days will be sufficient in summer, and six to eight days in the coldest weather. The reduction can be promoted by heating the syrup before exposing it to the sun.

This one is taken from Hager's Manual and Praxis:

Ferrous chloride..... 30 parts.
Hydrochloric acid..... 3 parts.
Syrup..... 480 parts.
Dissolve.

5556. Insolubility of Sulfonal.

(J. E. G.'s son and M. C. B.) The following prescription is sent for comment:

Sulfonal..... 1 dram.
Water q. s. to make..... 4 ounces.
M. Sig. 1 dram every 2 hours.

In commenting upon this prescription our correspondent makes salol (rather than sulfonal) the subject of his remarks, saying that he informed the doctor the latter drug was insoluble and asked if it was proper to dispense it in powder, capsule or pill. The physician directed him to dispense it as ordered and put a shake label on the bottle. Upon mixing with water the drug would not, with any amount of shaking, become evenly dispersed through the liquid. The prescrip-

tion was for a child six years old. Either sulfonal or salol is insoluble in the proportion of water given, and salol being insoluble in almost any proportion. Further, salol does not seem to mix with water, not becoming wet and as a rule floating upon the surface of the liquid. Our correspondent did rightly in objecting to dispensing the prescription as written, for it could not be produced in satisfactory form. If left to his discretion, he could have dispensed the salol through emulsification with a little almond oil and acacia, while sulfonal can be dispensed with mucilage of acacia alone. It is best, however, whenever possible, to dispense these highly insoluble articles in capsule or pill.

5557. Gummy Sponges.

(J. H. E.) The sponge is now generally conceded to be an animal. When first taken from the water it is covered with gelatinous matter from which it is afterward cleaned, leaving the cellular structure or what may be called the frame work of the animal alone. Various processes of cleaning and preparing for the market leave the sponge in a quite clean condition, though it frequently happens that the inner portions are not thoroughly clean. The gummyness of which you complain, however, is due to improper use of the sponge. Alkalies especially act upon it to break down the structure causing distinct chemical change in it. Then, too, if the sponge be left moist after using so that it cannot become dry within a reasonable length of time, a peculiar fermentation is apt to take place which destroys the structure of the sponge. When sponges become thus gummy it is very easy to tear them apart, and they are practically of no service. We do not believe that, having once reached this gummy stage, they can be restored to anything like their original appearance and quality, as there has been a definite destruction of their substance. If, however, the sponge is merely unclean, loaded up with dirt of whatever nature, you may have some success in subjecting it to a thorough cleansing operation. After thoroughly washing with soap and subsequent rinsing, soak the sponge in a 4 per cent solution of permanganate of potassium, wash, soak in a 25 per cent solution of sulphurous acid, rinse and dry. We have little faith, as intimated above, in any process to restore the sponge if it has passed into the gummy stage complained of.

5558. Analysis of Bronzing Liquid.

(C. H. H.) asks if a liquid which has been mixed with bronze powder can be analyzed by chemists after it has stood in combination for some time, and he farther asks if what is technically known as the "binder" in such a liquid can be made the subject of a patent in order to prevent others from using the gums employed therein. We do not think that a competent analytical chemist would be unsuccessful in ascertaining the identity of the liquid made. He might have some little difficulty in accurately identifying the variety of gum, but from the results he could obtain he could doubtless devise a preparation which would be near enough for all practical purposes. Bronze powder mixed with these liquids is not very liable to chemical change in the composition of the latter. As to patenting such a mixture, we believe it would be an unwise step, if you wished to keep the sale of it entirely to yourself. It

would be better to take out trade mark rights to it. Thus, you could call it Smith's Bronzing Liquid to distinguish it from Jones', or you could adopt some fanciful title or design for your trade mark and label, which would give you full protection against the infringement from other parties. In patenting a preparation of this nature you would be obliged to disclose its constitution to the patent office, from which department any one could obtain a copy of the patent, with your full formula, upon the payment of a very small charge. If you will write to the U. S. Commissioner of Patents at Washington, you will be supplied with pamphlets which will show you just how to take out a patent or copyright and inform you of the limitations of personal rights covered by either.

5559. De Conge's Balsamic Pectoral Syrup.

(C. G.) This being, as you inform us, a preparation of local manufacture, and so far as we can learn of local reputation and sale only, we can give you no information as to its exact composition, having never seen the article i. c. r. heard of it before. We would offer you, however, the following formulas for excellent balsamic pectoral syrups, one of which, perhaps, may serve you satisfactorily:

(1.)

Cherry laurel water... 1½ ounces.
Solution acetate morphine..... 1½ ounces.
Dilute sulphuric acid.. 1½ ounces.
Tincture saffron..... 1 ounce.
Orange flower water.. 3 ounces.
Glycerine..... 6 ounces.
Decoction Iceland moss..... 14 ounces.
Simple syrup..... 16 ounces.
Dose: 1 teaspoonful.

(2.)

Cherry laurel water... 1½ ounces.
Syrup wild cherry..... 3 ounces.
Solution acetate morphine..... 1½ ounces.
Dilute sulphuric acid.. 2 ounces.
Rose water..... 4 ounces.
Syrup poppies..... 40 ounces.

Dose: One teaspoonful undiluted, when the cough is troublesome.

The following formula is taken from Dorvault's L'Officine, under the title "Sirope Pectorale Balsamique":

Ipecac..... 10 parts.
Infusion red poppy..... 350 parts.
Vin de Bourgoyne..... 500 parts.
Tincture tolu..... 12 parts.
Extract opium..... 1 part.
Sugar..... 1000 parts.

Formulas and Information Wanted.

(M. M.) Phillips' Tonic.

(W. D. N.) Walker's Vigorene.

(W. H. N.) Red Butter.

A. P. A. ENTERTAINMENT EXPENSES. Local Secretary Henry Broth, of the Chicago meeting of the A. P. A., reports that he received a total of \$1,823.56, which was contributed in the following amounts. Wholesale druggists, \$1,100; retail druggists, \$1,260.50; manufacturers, \$636; Chicago fund for the entertainment of the Illinois Pharmaceutical Association, \$367.57; sale of tickets, \$75; from other sources, \$14.50. The total expenses were \$4,830.85, divided among entertainments, \$3,320; printing and miscellaneous, \$237.70; and other expenses, \$1,510. Some one had to go down into his pocket for \$7.30.

NEWS COMMENT.

The Columbus, O., Druggists' Association includes in its membership every druggist in the town, 82 in number.

A druggist of Grand Island, Neb., was fined for throwing advertising bills around the streets and pasting them on the sidewalks.

Druggist Weatherhead, Cincinnati, displays a sign stating that he has sold at retail 1,000,000 of a certain brand of cigars during the past year.

A drug store sign in St. Peter, Minn., is a novel one, the name of the druggist being spelled out in electric light which alternates from red to white.

Students of the Montreal College of Pharmacy held their annual dinner the evening of January 11. The banquet was a fine one and the speeches finer.

A Canadian paper states that twenty-seven pharmacists throughout the provinces have been challenged for selling adulterated pharmaceutical tinctures.

The Wells-Yeager-Best Company has been incorporated in Lafayette, Ind., with a capital stock of \$100,000, for carrying on a wholesale and retail drug business.

Virginia druggists are trying to secure certain important amendments to the pharmacy act, or, rather, the passage of a new bill to supersede the one now in force.

According to the Kentucky pharmacy law, all druggists were required to re-register before January 11. It is stated that a number have failed to comply with this requirement.

John L. Curry, who since 1889 has conducted a drug store at Second and Calowhill streets, Philadelphia, left January 13 for a few months' pleasure vacation in the Bermudas.

W. A. Kendall has purchased the interest of his brother in the firm of W. A. Kendall & Co., druggists, at Buffalo, N. Y., and will hereafter conduct the business under his own name.

Harnist & Dale, druggists of Edwardsville, Ill., are finding very serviceable a unique advertising scheme, which consists of placing signs at street corners giving the name of the street and under them an advertisement of their business.

For some time members of the Hartford, Connecticut, Druggists' Association have observed a Sunday closing agreement, but the backsliding of two or three members has occasioned abandonment of the scheme.

A young man in the employ of Finlay & Brunswig, wholesale druggists of New Orleans, was seriously cut by the explosion of a bottle of colloidion into which, for some unexplained reason, he was introducing gunpowder.

The superintendent of the St. Louis City Hospital says that if people would wash out their mouths twice or three times a day with an antiseptic solution there would be a great decrease in the amount of sickness.

The United States Government is sustaining a cut-rate patent medicine drug store at the Soldiers' Home, Dayton, O., \$1 articles being sold for 85 cents. The local drug association have called the matter to the attention of congressmen from their district and hope to have the matter properly adjusted.

Sensational reports are appearing in the newspapers to the effect that the body of W. C. Shortt once a well-known young druggist of Louisville, Kas., but who for many months has been among the mysteriously disappeared, has been found in the pickling vat of a medical college in Atlanta, Ga.

H. Pratt McKean died in Philadelphia January 5, at the age of 81. He was a very wealthy man, having acquired his riches in early life through trade in China. He was a large exporter to that country of ginseng, in return for which he received teas and silks. He was a well-known business man of Philadelphia.

The store of the Jacobs Pharmacy, at Atlanta, Ga., was badly damaged by fire couple of weeks ago, the loss being estimated at nearly \$100,000 on an insurance of \$60,000. The fire originated in the second story, thence quickly extended to the large stock of patent medicines, etc., on the third floor. The flames and water together did wholesale havoc.

David Wilson, a hermit in Robinson, Ohio, died a few days ago. At one time he was the owner of a drug store in Cincinnati, which he kept locked for twenty years, being, as he said, instructed by the devil not to open it. He lived by himself in a house which he claimed belonged to Christ. He was at one time one of the best physicians in the state, but became deranged. He leaves a large estate, said to be worth over \$100,000.

W. H. Syfert, Dayton, O., is having placed in his drug store a handsome Tufts' fountain, having a value of \$3,000, which contains twenty-six syrup jars and is equipped with six draught arms. A French plate mirror 556 feet and a new 15-foot antique oak counter are attractive adjuncts to the fountain. This store also boasts of its large stock of homeopathic remedies, which it is claimed is the largest in the state.

Montgomery & Parker, Quincy, Ill., druggists, are out \$150 through having cashed a worthless check for a traveling man whom they thought they knew, as they had been acquainted with him for a number of years. The draft was on a Detroit bank and the salesman claimed to be representing one of Detroit's white lead concerns, showing papers and letters in support of his statements. Those at the Detroit end disclaim any knowledge of the swindler.

J. D. Mitchell, a commercial traveler, went to Grayson, Va., about a year ago to sell goods. He was soon taken ill with the measles, and the spreading of the disease caused the death of several persons. The authorities looked up a provision in the code and fined Mitchell \$1,500. The Legislature of the State has just passed a bill to relieve Mitchell from the payment of this fine. It is bad enough to have the measles without having to pay for the privilege.

Milwaukee druggists have been up in arms against the proposition of the telephone company to place in the drug stores automatic nickel-in-the-slot telephones. Some of the druggists objected to this method from the fear that the drug store telephones would be neglected in favor of those of other subscribers who might be willing to let the people use the instrument for nothing. Some sort of a compromise has been effected between the retailers and the company.

A. F. Files, for six years druggist at Maumee, O., has sold his store to his clerk, L. A. Eckert, and goes west prospecting, intending to secure a clerkship at Denver while seeking a suitable opening to establish a new business.

In a Booneville, Mo., drug store the boy, a young negro, found a rubber tube connected with a barrel of alcohol, and thinking it a good chance to get drunk sucked away at it for a considerable length of time. He was later discovered in a very intoxicated condition and died in a few hours.

J. A. and Dr. McAlpine, Vancouver, B. C., were fined \$75 and costs each under the pharmacy act by the police magistrate. Their offenses consisted in employing unqualified assistants, selling poisons without license and failing to pay their fees to the Pharmaceutical Society. They appealed their cases in the County Court, and Justice Bole quashed the magistrate's decision. A similar result followed in Victoria, Westminster and Nanaimo, B. C. The judges ruled that under the act a druggist who offended similarly to the defendants could not be prosecuted. In other words, the act was imperfectly drawn up and in its present shape was useless. Already the Druggists' Council of British Columbia are hard at work drafting another act for submission to the Provincial Government at their next session.

The newspapers inform us that a young man in Alleghany, Pa., has invented a bottle which cannot be refilled without breaking. It is believed this will prove an excellent article for patent medicine manufacturers, whisky dealers and the like, who find that their bottles are often opened and emptied and refilled with fraudulent concoctions by unscrupulous parties. The invention is rather blindly described as consisting of a small groove in the neck of the bottle which admits the insertion of a piece of glass made in such a manner that a round, flat disc fits over the main spring in place of a cork. The bottle is filled and the neck is fitted over and capped by a small steel spring on the inside. Once in position, it cannot be removed without shattering the glass. Fluids can be poured out of the bottle, but not into it. We await further enlightenment.

On December 26, 1893, occurred the death of T. J. Looney, Jr., a well known apothecary, Portland, Me. Mr. Looney was born in Portland in 1836 and was a graduate of the Portland High School. At the age of fourteen he entered the employ of Emmons Chapman, corner of Middle and Exchange streets. Here by dint of study and strict attention to business he reached the top of the ladder, becoming manager of the store by the death of the proprietor. He afterward went west and was at the head of the prescription department in the beautiful store at Central City, Colorado, then owned by John Best and known as Best's Pharmacy. He returned east to his native city and owned and conducted a retail apothecary store corner of Franklin and Middle streets. The deceased was well known throughout Maine and Massachusetts, being a registered apothecary under both state laws. Hon. Wm. H. Looney and Miss Mary E. Looney, teacher in the public school, are the surviving brother and sister.

AN OLD FIRM IN A NEW HOME.

In the last few years the business of Carter, Carter & Kilham, of Boston, has increased to such an extent (double what it was in 1885) that new quarters have been imperatively required, and, with enterprise characteristic of this old house, a building for the exclusive use of the firm has been erected in an eligible situation on Merrimac street, corner of Friend street, within a moment's walk of the new union railroad station. In deference to the wishes of many customers, the firm has been desirous of giving up the retail business, which was almost a necessity in the old location. This will now be done, attention being confined strictly to the wholesale and jobbing trade.

The front of the new building, which extends for 100 feet along Merrimac street facing Warren Square, is of red brick and Berea sandstone. It is an adaptation of the Italian Renaissance to the needs of a modern American business building. The building is most carefully and thoroughly constructed. The special features of the front are the exceptionally large plate-glass show windows, and the artistic treatment of the fifth story openings and cornice. The architect is Arthur H. Bowditch, of Boston. The building is furnished with a large electric elevator and two smaller pneumatic elevators. There are also pneumatic tubes connecting each floor with a central station, near foreman's desk on the second floor. The basement is furnished with fire-proof vaults for storage of costly essences, oils, and chemicals. Here also are located the boiler room and pumps. The street floor has a 15 foot stud with a mezzanine covering about two-thirds of the same, but so skilfully arranged as not to give one an oppressive feeling. A part of this floor is used for receiving and delivering goods; the rest for the counting-room, private offices, salesroom and billing department, telephone room and pneumatic station. There is telephonic communication from this story with all parts of the building. This floor is finished in oak, with cases and tables for the advantageous display of samples of each line of goods dealt in by the firm. The mezzanine is for chemicals, sponges, chamois, toilet articles and rubber goods. The second floor contains a complete system of balconies, and shelved uprights, for the accommodation of patent medicines and pharmaceutical preparations. This floor is also the main work-room, where all orders are collected and packed ready for shipment. On the third floor there are convenient arrangements for barrels, bins and cases; also storage room for full packages. The fourth floor contains the liquor and wine room, and the rest is used for glassware and sundries in open packages. On the fifth floor are found the laboratory with the bottled specialties, and the oil and tincture department. In the rear part of this floor there is storage space for patent medicines.

Solomon Carter, the originator of the firm, was born in Lancaster, Mass., Jan. 19, 1816. After serving as an apprentice in the drug stores of Gregg & Hollis and Thomas Hollis, he began a retail business in 1837 at the West End. Removing to Hanover street, he continued in the wholesale and retail business for about twenty-five years, under various styles;

CARTER, CARTER & KILHAM'S NEW PREMISES.

then he sold out and formed a new concern on Washington street, opposite School street, under the style of Carter & Wiley. Some time afterward he bought out Mr. Wiley and formed a new connection under the style of Carter, Harris & Hawley, doing business at 356 Washington street. The present firm was formed in 1886, Messrs. Harris and Hawley retiring, and Fred L. Carter and Chas. A. Kilham being admitted. On January 1, 1892, Herbert L. Carter was admitted to the firm. When Solomon Carter died the firm continued under the same name, the estate of Solomon Carter remaining as a partner.

Fred L. Carter, son of Solomon Carter, was born in Boston, October 30, 1849. On leaving school he went to the firm of Carter & Wiley as a boy, worked along through the different departments, and for twelve years was a traveling salesman. As stated, in 1886 was admitted to the firm. Since his father's death he has been the senior partner. Indeed, for the two or three years previous he attended to the responsible duties usually performed by the elder partner.

Chas. A. Kilham was born in Wenham, Mass., December 18, 1853. He entered the employ of Carter & Wiley as a boy, in 1871; became entry-clerk, and then a traveling salesman. With F. L. Carter, he was admitted to the firm in 1886. During the last three months Mr. Kilham has given most of his time to the firm's new home, and it is due to his watchful care that the building has been made so convenient.

Herbert L. Carter, the junior member, was born in Boston, April 16, 1852. On leaving school he worked for the Boston house of A. T. Stewart, afterward becoming entry-clerk for Carter, Harris & Hawley. He then became the city salesman. He was admitted to the firm in 1892.

The firm has always been popular in the trade, Solomon Carter in particular, having always been a favorite with old and young. Probably no one in the business has kept so many faithful employes so many years. The trade has been fa-

miliar with the bookkeeper, Geo. F. Hawley, for more than thirty years. One salesman, Jos. E. Melgs, has been with the different firms for twenty-five years. The head entry-clerk, Wm. T. Hilliard, has served for twenty years, and other employes, not so well known, began with Mr. Carter from thirty to thirty-five years ago.

The regular quarterly meeting of the Trade Association of the Philadelphia Druggists was held January 9, President Kratz in the chair. The subject of closing stores at least a portion of each Sunday was continued from the preceding meeting, and it would appear that considerable progress has been made, but it is doubted very much if the custom will obtain universally in a large city like Philadelphia, where the druggists will never act as a unit in anything to improve their condition. Some druggists always have closed, and it would seem as if the matter will have to be left to individuals to decide as their feelings or imagined interests may prompt. Those who close say they do not find any loss of custom, however. The attention of the meeting was called to the well-known fact that the state board was continually baffled in its attempt to carry out the provisions of the pharmacy act. This applies particularly to the section requiring properly qualified persons to be left in charge during any temporary absence of the proprietor, and in fact even, of such persons themselves conducting a drug store. Our association is earnestly requested to co-operate with the state board. Further consideration of the subject was deferred until the next meeting. Adjourned. E. T. Ellis, secretary.

One of the finest drug stores in the West is being fitted up in the San Marco building, East Walnut Hills, Cincinnati, O., by A. E. Diebold.

Frank L. Grothe, Ph. G., has purchased the drug store formerly occupied by Dr. John H. Rendigs, Spring and Abikall streets, Cincinnati, O.

BOSTON.

Boston, January 25.—It is said that more than 95 per cent of the retail druggists of Boston and its vicinity have agreed to stand by the Detroit plan, adopted at the last meeting of the National Wholesale Druggists' Association. One of the largest and most enthusiastic meetings of druggists ever held in Boston crowded Garfield Hall, No. 1125 Washington street, the other day, and the first steps towards putting the plan in operation in this part of the country were taken. N. W. Stiles presided, and F. W. Iteevess was secretary. Just what was done at the meeting those present refuse to state, except that the movement has surpassed anything in the history of the drug trade, and that the plan will be put into effect with a suddenness and effectiveness which will astonish the cut-rate firms. The retailers appear confident that the manufacturers will join with them. It was reported at the meeting that Rhode Island had organized and secured about 85 per cent of the retailers, while in both Springfield and Worcester every retailer had joined the Interstate League, except one in each city. New Hampshire has three branches, Lowell has a strong organization, and favorable reports were received from other places. There is no doubt but this movement is going to be more extensive than anything the trade has ever seen, for there are men at the head of it who usually mean business, but have formerly kept clear of such movements.

In a decision just filed by the full bench of the Supreme Court in the case of Franklin H. Gould vs. W. H. Emerson, a peculiar mistake which occurred in 1886 is set right. The parties to the suit were a firm of druggists in North Attleboro, and in 1886 agreed to dissolve the copartnership; the plaintiff was to take the goods on hand and pay the defendant his interest therein. The value of the goods was set at \$18,000 and the plaintiff gave the defendant his note for \$8,000, which has since been paid. There was no mistake as to this. But the plaintiff had withdrawn from the funds of the firm \$10,000 more than the defendant had, and, to make this right between the parties, the plaintiff would have to restore the \$10,000 to the firm, or pay the defendant, for his share, \$5,000. "Instead of doing this, by sheer inadvertence or ignorance of what is plain," says the Court, "the plaintiff gave his note for \$10,000 to the defendant. This gave the whole of a sum which belonged to the firm, and which defendant was entitled to only one-half of. The mistake, though gross, was mutual and innocent, and the plaintiff, at any time, upon discovering it, might have had a bill in equity for relief against it." The plaintiff on discovering the mistake in 1893, after paying interest on the \$10,000 note for seven years, brought the present suit, and the conclusions of the Court is that the plaintiff, "upon the facts, would be entitled to have the original note for \$10,000, upon which he has paid \$8,000, surrendered and canceled and have the overpayment of \$1,000 refunded, and also have the interest refunded which he has paid in excess of the interest due on the \$5,000 which he justly owed. The \$10,000 note should be treated as valid for \$5,000 and all payments of principal and interest in excess of what would have been due if the note had been \$5,000 should be re-

funded." As the plaintiff owed the defendant \$1,000 borrowed money the decree is to be modified so as to allow of the payment of that sum.

Simon B. Harris, of Lowell, has been appointed state inspector by the board of pharmacy, and he will at once make a tour of the state, visiting all of the drug stores for the purpose of securing the names of "druggists" who carry on business without the services of registered clerks, as well as the men who hire registered clerks to carry on the drug business. A report giving the standing and reputation of every druggist visited will be filed with the state board, who will act upon them in turn. Mr. Harris says of this matter: "Since I received my appointment I have visited drug stores in Holyoke, Fall River, Worcester, Haverhill and a portion of Boston. In Fall River I found a druggist doing business on a certificate which was owned by a clerk in the freight house in that city. I called on the clerk and he told me he received a certain amount each week for the loan of his certificate. I found in another instance that the owner of a pharmacist's certificate was paid \$3 a day by the holder of a sixth-class liquor license for the use of his certificate. In Boston I found a man who made it a business of being examined before the state board of pharmacy for druggists' certificates. These certificates he sold, taking at the examination the name of the intended purchaser. In Fall River I told the city marshal I wanted to work in co-operation with the local police in each city. The marshal told me he would bring the matter to the attention of the mayor and aldermen. I receive encouragement from all the reliable druggists of the state in the work assigned me."

Subjoined is the text of one of the bills just introduced in the Massachusetts legislature relating to the granting of licenses to druggists to sell liquor:

Section 1. No license of the sixth class described in section ten of chapter one hundred of the Public Statutes shall hereafter be granted to any person who is not a registered pharmacist, actively engaged in business on his own account; nor to any such registered pharmacist unless he shall present a certificate from the state board of registration in pharmacy stating that, in the judgment of said board, he is a proper person to be intrusted with such license, and that the public good will be enhanced by the granting of such license.

Sec. 2. For each certificate so granted by the board of registration in pharmacy said board shall be entitled to receive a fee not exceeding one dollar, to be paid by the applicant. Such certificate shall not be valid after one year from the date thereof.

Sec. 3. Chapter two hundred and seventy-one of the acts of eighteen hundred and eighty-nine, and also all acts and parts of acts inconsistent herewith, are hereby repealed.

Sec. 4. This act shall take effect upon its passage.

At the session of the Board of Registration in Pharmacy held January 2, 3 and 4, forty-two applicants were examined and the following named five were granted certificates: Alfred F. Viallan-court, of Woonsocket, R. I.; Laurence E. Pedrick, of Cambridge; Maurice E. Cotter, of Lawrence; Charles H. Webster, of Newburyport, and D. Frank Buckley, of South Groveland.

According to the report submitted by the State Board, the whole number of complaints entered by the State Board in the courts of the commonwealth for violation of the acts relating to food and

drug inspection was 96. In 32 cases, or 33.3 per cent, of these, the parties were convicted. The amount of fines paid into the treasuries of counties, cities and towns under the provisions of the general and special laws relative to the inspection of food and drugs, was \$2,475—though it should be clearly understood that by far the greater part was an account of adulterated food, rather than drugs.

Vice-president Charles W. Dexter of the Wells Memorial Institute, delivered a practical talk on "Things not Generally Known" before a large number of people in the library the other evening. He told of the good and bad purposes to which such drugs as opium, morphine and carbolic acid could be put, giving much useful information for fathers and mothers who have not time to study these questions.

H. A. Weymouth, of Saco, Me., has put in a new soda fountain.

Everett is soon to have another drug store, situated on the main street.

Solomon A. Epstein, a well-known druggist in Chelsea, has lately become married.

W. A. Oxnard, formerly of Holbrook, has taken Fraser's drug store in Charlestown.

E. W. Landon has become the proprietor of Dixon & Arkley's drug store at Milton, Vt.

F. A. Woodbury, of Maverick square, East Boston, has sold out to the D. A. Eaton Drug Co.

Andrew G. Weeks, of the Weeks & Potter Co., has given \$100 to the General Theological Library.

O'Hearn, the Waltham druggist, has sold out, and is to go into the business of selling silver polish.

J. N. Perley, a Lebanon (N. H.) druggist, was a sufferer to the extent of \$4,000 by a fire on January 15.

Jackson S. Potter, formerly with R. J. Kennison & Co., Roslindale, is now head clerk at Arthur Chesley's.

George E. Sampson has opened a new drug store at Skowhegan, Me. It contains Tufts soda apparatus.

Samuel T. Jeffers, druggist at 1273 Dorchester avenue, has been arrested for violation of the liquor law.

S. R. Crabtree's new drug store at Island Falls, Me., is said to be the only one within a radius of thirty miles.

Postmaster H. B. Johnson, of West Roxbury, has bought of J. W. Tufts some hot-soda apparatus for his drug store.

Among the contributors to the fund in aid of the unemployed in Boston appears the Weeks & Potter Co., which has given \$100.

Kerrigan, late in the drug business in Brighton, where he was unsuccessful, has started another store at Newton Upper Falls.

John D. Footer, Bath, Me., will soon open a new drug store there. He has lately had Tufts put in some soda apparatus.

Peter Dempsey, an employe of Weeks & Potter, has been arrested for embezzlement of \$13 at different times within the past few weeks from his employers. Dempsey is 21 years of age.

J. W. Tufts is building a \$5,000 soda fountain for H. E. Brown & Co., of Detroit, and some expensive apparatus for the Moxie Co. Evidently trade will be brisker as spring draws nearer.

J. F. Lanable, junior partner in the drug firm of H. E. Tucker & Co., Waterville, Me., has become sole proprietor of the establishment.

J. M. Dwyer, formerly of Canaan, N. H., has bought out the interest of his partner, Mr. Whitcomb, in the drug store at White River Junction, Vt.

Mr. Weld, of West Warren, has engaged a new druggist, Joseph P. Fitzpatrick, from Waterbury, Conn., to take the place of Ethan T. Hall in his drug store.

The Raymond Medical Co., Raymond, N. H., has sold its pharmacy to Lewis G. Gilman, of Milford, N. H., who was for several years a clerk in the town of Raymond.

Frank A. Davidson, of the Theodore Metcalf Co., has sold his country estate in Stow to Thomas Lord, of this city. The estate comprises about thirty acres of land, with attractive buildings.

One of the city offices in the gift of the new mayor of Fall River went to James C. Brady, a popular druggist, who has already demonstrated that he is as capable a man in his new calling as in his old.

Dr. Eli Thayer, of Melrose, is dead. Dr. Thayer opened the first drug store in Weymouth many years ago, in a building purchased by him from Nathan Matthews, Sr., father of Mayor Matthews, of Boston.

Mr. Merrill, of Merrill & Chesley, Atwood's block, Roslindale, who is the Chicago agent of the E. L. Patch Co., has sold his interest in the Roslindale store to Arthur Chesley, who will continue the business.

Charles A. Baker, who was one of the sufferers by the disastrous fire in Fall River a few weeks ago, is now doing as much business as ever, and one would not realize that there had been a bad interruption.

The Vaughan Drug Co. has been organized at Portland, Me., for the purpose of manufacturing drugs and chemicals, with \$10,000 capital stock. The officers are: President, A. Montgomery; treasurer, A. A. Montgomery.

State Detective Seaver, who has been looking into the North Attleboro poisoning case, where several tramps took a deadly drink, says there is nothing whatever to warrant holding the drug clerk responsible for the affair.

Scores of friends of John F. Neill have called at his new drug store in Union street to compliment him in its fine appearance. Such a handsome place is a novelty in that part of the city. Mr. Neill was formerly with Cheney & Myrick.

E. M. Johnson, of West Warren, has secured the services of Mr. Bugbee, a registered pharmacist with nine years' experience in the employ of E. O. Gates, a leading druggist of Springfield. Although Mr. Morgan retains an interest with Mr. Johnson he is obliged to return to his drug store in Holyoke.

At his home at Sunnyside Terrace, Medford, Darius W. Pollard shot himself in the head with a revolver and instantly died. Mr. Pollard had been sick with a complication of diseases for the past five years, being 64 years of age. He was engaged in the drug business in Magoun Square, Somerville, until four years ago, when he gave up the business to his son on account of his poor health. A widow and four grown up children survive him.

A number of the members of the Massachusetts College of Pharmacy Alumni Association gathered in the hall of the college on St. Botolph street the other night to hear Dr. Augustus H. Gill, of the Institute of Technology give a short talk on "The Methods of the Investigation of Gases." The lecture was technical in its character and consisted of a minute description of the methods and apparatus used.

The appointment by the Mayor of Somerville of three new men on the license committee is regarded as significant after the druggist license agitation of the past year. None of the men have spoken very strongly in favor of the druggists, and their action and that of the board on the license petitions will be watched with interest. Five petitions were received by the aldermen, at their last meeting, for sixth class, or druggists' licenses, and were referred to the license committee.

A report is current in New Haven, Conn., that a new chemical laboratory for the Sheffield Scientific School, will soon be erected. J. Cleveland Cady, the New York architect, who built the Metropolitan opera house, was in town a short time ago consulting with Prof. Marsh and others about plans. Prof. Brush, director of the Yale scientific department, said relative to the report, "there is no immediate prospect of such a building. We feel the need of one, but funds for its construction are lacking. We have talked the matter over informally with Mr. Cady, of New York, but no plans have been drawn up."

R. J. Kenniston & Co., of West Roxbury, have secured the services of Miss Sweetser, of Stoneham, a registered pharmacist and a member of the senior class of the College of Pharmacy. Miss Sweetser was the only lady in the class of one hundred students, and after her successful examination, one of the leading members of the Board of Pharmacy, and one of whom the young men stand most in awe, in addition to her certificate presented to her a handsome bouquet, congratulating her upon her success. She has been employed in a dispensary in Boston, and also in one of the leading drug stores in Providence, and comes highly recommended.

The East Boston court room was crowded with people who wanted a glimpse at the two men who made the assault on Henry D. Huggan at his drug store in Maverick Square, when the case came up for trial. Samuel McSheehy, the leader in the assault, stands fully six feet, and is heavy and muscular. William I. Sullivan, his associate in the affair, is shorter, younger, and of lighter build. He was formerly a substitute letter carrier. McSheehy once kept a drug store at the corner of Putnam and Chelsea streets. Sullivan pleaded not guilty to a charge of drunkenness, and also to that of assault on Mr. Huggan. McSheehy was charged with drunkenness, assault on Mr. Huggan, assault on Henry F. Gould, at whom he is alleged to have thrown a jar of whipped cream which landed on Gould's neck, and malicious injury to personal property to the extent of \$450. He had counsel, who asked for a continuance. McSheehy was held in \$1,200 bonds on all the charges against him. Sullivan was held in \$100 on the charge of drunkenness only, and his case was also continued.

ANNUAL DINNER, BOSTON DRUGGISTS ASSOCIATION.

FRANK A. DAVIDSON,
Retiring President.

One might have thought, on the afternoon and evening of January 23, that the headquarters of the Boston drug trade had been suddenly established at Young's Hotel, for that well-known house appeared to be overrun with men prominent in the business. All this was due to the fact that the Boston Druggists' Association was holding its annual meeting there. This association was formed in 1875 for the furtherance of the interests of the wholesale and retail drug trade, the paint and oil trade, medicine houses and co-ordinate branches of business. Although largely a social organization, it frequently takes up at its monthly meetings matters of much concern to the general public, and the animated discussions bring out ideas of noticeable worth. The retiring president of the association, Mr. Frank A. Davidson, Ph. G., of the Theodore Metcalf Co., has long been one of the most enthusiastic and industrious members, and his services to the organization will be pleasantly and appreciatively remembered.

At the business meeting, officers for 1894 were chosen as follows: President, James F. Babcock; treasurer, Thomas L. Jenks; secretary, James O. Jordan; executive committee, Harvey S. Sears, Charles A. Kilham, William A. Chapin, George W. Cobb, Freeman H. Butler, Charles F. Cutler and Alfred H. Bartlett; committee on membership, R. L. Richardson, George H. Ingraham, Josiah Bryant, William W. Bartlett and Fred L. Carter.

When the business had been disposed of a reception was held, and soon after 6 o'clock dinner was served in the principal banquet hall. There were more than a hundred gentlemen present, the list of guests including Governor Frederick T. Greenhalge, Private Secretary Thomas; B. T. Fairchild, of Fairchild Brothers & Foster, New York; M. N. Kline, of Smith, Kline & French Company, Philadelphia; Professor E. L. Patch, president of the American Pharmaceutical Association; W. F. Sawyer, president of the Massachusetts College of Pharmacy; D. O. Haynes, of the Pharmaceutical Era; C. A. Mayo, editor of the American Druggist, New York, and J. Allen Rice, president of

the Massachusetts State Pharmaceutical Association. Among others present were such well-known men as Theodore Metcalf, Joseph Burnett, Professor G. F. Markoe, N. J. Rust, A. K. Tilden, Thomas Dolber, Dr. T. L. Jenks, C. A. West, J. A. Gilman, S. A. D. Sheppard, Hon. W. B. Rice, G. M. Garland, M. D., Henry Canning, H. M. Whitney, W. W. Bartlett, J. F. Neill, G. B. Markoe, J. A. Rice, F. H. Butler, Thomas Hollis, Francis Hollis, L. B. Hollis, F. L. Carter, I. B. Patten, F. B. Patten, S. A. Fowle, F. H. Fowle, M. L. H. Lovvitt, B. Jenney Jr., C. W. Cheney, S. A. Neill, C. H. Carter, Josiah Bryant, H. S. Sears, W. A. Chapin, G. H. Ingraham, R. L. Richardson.

Seldom are arrangements for an occasion of this kind more tastefully made or more skillfully carried out. Take the bill of fare, for example; it was printed in beautiful old-fashioned type, on the finest paper, and on the face of the bill there appeared the quotations, "Intercourse is the soul of progress" and "Everywhere in life the true question is not what we gain, but what we do." This was the clever idea of Mr. Thomas Dolber, of the Dolber-Goodale Co.

After the feast, President Davidson addressed the company briefly. "Language was given to us that we might say pleasant things to each other," was the first pleasant thought printed beneath the list of toasts, and the "Commonwealth of Massachusetts" was the first regular toast. Mr. Davidson said:

"No class in the community has a deeper feeling of loyalty to our government than the guild of merchants who compose the Boston Druggists' Association. It is sometimes considered facetious, on occasions of this kind, to allude to the druggist's back shop where the convivial guest may help himself, provided it is done strictly for medicinal purposes. I know I but give the sentiment of every druggist present when I say that such references meet with no approval from our association. There is no druggist worthy of our membership who does not respect any and all of the laws which the Legislature may give us, and who does not earnestly desire to assist in enforcing them. Our laws have not always been such as we could approve; but, while they have remained upon the statute book as laws, the members of the Boston Druggists' Association have accepted them and endeavored to co-operate with all branches of the government in their enforcement. But the commonwealth has always been more fortunate in her executive than in her legislative department. No state can point to a more honorable line of distinguished names than those men who have from time to time filled the chair of her chief magistrate, whatever the prevailing political opinion of the majority of her citizens. The Governors of Massachusetts from the earliest history of the state have been distinguished for their ability, integrity and patriotic devotion to what they believed to be for the best interests of the commonwealth. Our present Governor, always faithful to the many and diversified public interests with the administration of which he has been charged, is, we believe, a most worthy successor to the office which has been filled by such distinguished citizens—Andrews and Rice, Gaston and Russell.

"We are honored this evening by her chief executive, His Excellency Hon.

"Intercourse is the soul of progress."

Annual Dinner

.. of the ..

Boston Druggists' Association

January 23, 1894

: Young's Hotel :

Boston

Music by : :

The Association's Mandolin Club
A Chorus of Men and Boys

"Everywhere in life the true question is not what we gain, but what we do."

MENU.

"A dinner lubricates business."
Cotuit Oysters.
"Music is well said to be the speech of angels."
Consomme a la Dauphine. Green Turtle.
"Turtle makes all men equal."
"Laughter is the chorus of conversation."
Saddle of Venison, Jelly Sauce.
Roast Philadelphia Chicken.
Fillet of Beef aux Champignons.
"Simple diet is best."
Cromesoult of Lobster, Cardinal.
"Cutlets of Chickens with Peas."
Vol au Vent Salpicon.
Banana Fritters, Glace Cognac.
Timbales of Spaghetti, Hallenne.
"Appetite comes with eating."
"Joy is the best of wine."
Lobster Salad. Chicken Salad.
"Be merry if you are wise."
Black Duck. Larded Grouse.
"Music makes a glad remembrance of our youth, calls back past joys, and warms us into transport."
Charlotte Russe. Frozen Pudding.
Lemon Meringues. Madeira Wine Jelly.
"Enjoy your present pleasures so as not to injure those that are to follow."
Oranges. Bananas. Apples. Nuts.
Raisins. Figs. Ice Cream. Sherbet.
Cheese. Olives. Coffee.
"The charm of music dwells not in the tones, but in the echo of our own hearts."

TOASTS.

"Language was given to us that we might say pleasant things to each other."
"The Commonwealth of Massachusetts."
His Excellency the Governor.
"Words are the voice of the heart."

"Music is well said to be the speech of angels."
The City of Boston,
His Honor the Mayor.
"The most important part of every business is to know what ought to be done."
The Press.
Hon. W. E. Barrett, Boston Advertiser and Record.
"Journalism has already come to be the first power in the land."
"Music washes away from the soul the dust of everyday life."
The National Wholesale Druggists' Association.
Mr. M. N. Kline of Philadelphia.
"Be always resolute with the present hour."
The American Pharmaceutical Association.
President E. L. Patch.
"Every noble activity makes room for itself."
The New York College of Pharmacy.
Mr. Benjamin T. Fairchild of New York.
"We enjoy ourselves only in our work: our doing, and our best doing, is our best enjoyment."
"The meaning of song goes deep."
The Massachusetts College of Pharmacy.
President Wm. P. Sawyer.
"I hold every man a debtor to his profession."
The Pharmaceutical Press,
Mr. Benj. Lillard, The Druggists' Circular, New York.
Mr. D. O. Haynes, The Pharmaceutical Era, Detroit.
"Through the rare felicity of the times, you are permitted to think what you please and to publish what you please."
The Incoming President,
"The only competition worth a man is with himself."

Fred'k T. Greenhalge; a long life and prosperity to him, and may it be many years before he is forced to enter the ranks of the unemployed."

Gov. Greenhalge, being then called upon, made a speech which was applauded heartily. He was welcomed with three hearty cheers, the company also rising and singing to the tune of "Daisy Bell" a merry song. His excellency gracefully acknowledged this pretty compliment and continued as follows: "I am glad to find myself among friends. I meet here a great many whom I have known before in ranks of earnest workers in various responsibilities of life. I have been surprised at the widespread scope of your organization. I meet here men of earnest purpose, of scientific training, of eager ambition. We meet those representatives, and nothing is more encouraging to the representative of Massachusetts, whether he be the executive or the citizen engaged in prosecuting her work in every department, than the high respect, the esteem and devotion which prevails throughout the country toward the great commonwealth which we represent. It is something which we desire to perpetuate, to continue, to extend, to advance and to develop.

"You represent a most important department in the work of this commonwealth, and of the work of the country of which the commonwealth is so important a portion. It is of the utmost importance that sincerity, honesty, truth, should prevail in your councils and in the work of every representative of your body. We are told frequently that there is some objection to a paternal supervision of the individual work. Do not be too much afraid of paternal supervision. The state has an important part to fill in helping out the individual. The collective work of the community is worth vastly more and is more efficacious than the work of any individual can be. Registration of pharmacists was valuable—it has proved itself to be so. Registration of practitioners of medicine is equally important. We need work of that sort on the part of the commonwealth. It does not destroy individuality. It protects the people, and anything that protects the people does not degrade or interfere with the rights of the individual. Therefore, I say, my friends, that while we will protect the rights of the individual to the last degree, we at the same time will insist that the whole body of the community shall advance just as the sun moves. One practical point I leave you as a message for this great organization—that a pharmacist is a pharmacist. He is not the keeper of a grog shop; he is not an impostor attempting to delude the people under an honorable name, cheating and deceiving the lawmakers and the spirit of the law. You want to purify the ranks. It is your duty to see that the honorable name of the profession is not profaned and dragged in the dust. Therefore, the present law, which gives you power to register the true, the genuine, the honest pharmacist, must be carried out with adequate means. You must see to it that the work is carried out efficiently, successfully and thoroughly. It is a duty you owe the public and yourselves. I say, look to it that this work is well done, that you keep the honorable name of your guild, your profession, of your calling, so that no man can say of you, or of any member of your organization, this is simply a sort of organization

JAMES F. BABCOCK,
President-Elect.

James F. Babcock, the new president, was born in Boston in 1844 and was educated in the public schools and at Harvard. In the Lawrence Scientific School, under the direction of the late Prof. E. N. Horsford, he made a special study of chemistry, and on leaving the school he entered upon the practice of chemistry, speedily acquiring a high reputation as an expert. In 1869 his ability was so marked that he was called to the chair of chemistry in the Massachusetts College of Pharmacy. There he remained till 1874, when he resigned to accept a similar position in Boston University. For six years he did excellent service here. He held for many terms the office of State

Assayer and Inspector of Liquors, and owing to his activity and influence important legislation relating to the liquor trade was secured. In 1885 Prof. Babcock was appointed Inspector of Milk and Vinegar in the City of Boston, and so well were his duties performed that one Mayor after another continued him in the office. Here, as in his state position, he accomplished important reforms, the benefit of which is widely recognized. At odd times Prof. Babcock has appeared upon the lecture platform, and he has also been called into many legal cases where his knowledge of chemistry made his testimony of the greatest value.

in which a man may get a license and authority from the state, and may then prostitute it to the basest of uses. I say, keep up the spirit of this organization, for the higher, purer spirit of the age is work—more work, better work, more determination to have things known by their right names. Let us know who is genuine, who is untrue, who is honest and who is faithful. Continue this work, purify the lists of your registration, just as we want the voting lists purified, and you will increase the respect of your profession."

Mr. M. N. Kline, of Philadelphia, "a friend of the retail druggist and a warrior for the wholesalers," described the formation of the National Wholesale Druggists' Association, and said that it had begun and carried through all the reforms which had become facts in the trade. The organization had largely succeeded in minimizing evils in the trade, and had to do with reforms in the retail business. That more success had not resulted in these efforts was probably because the retail trade was not so united as it might be. He urged the need of union in the retail trade as a prerequisite of success.

President Edgar L. Patch of the American Pharmaceutical Association said that this is an era of organization; it is a strange fact that the tendency of modern times in America is toward centralization of power, with a trend toward paternalism. The druggists have fallen in to line and organized again in the State Association, the Interstate League and the National Association. The State Association has come to comprise the best men, and yet the idea to be cultivated is the American and the national idea. He bespoke the hearty aid and appreciation of the members in favor of the American Association.

Representing the New York College of Pharmacy, Mr. Benj. T. Fairchild spoke highly of the standing of the college. He felt that Boston and New York were engaged in a friendly rivalry in the matter of training in pharmacy, working for the good of the trade. He confessed that the promoters of the New York school had resolved that they must beat Boston in order to succeed, and that they had sent some of their young men over to examine the Boston school before deciding on what they would do. He thought Boston and New York should

have no invidious rivalries in this branch of instruction, each had its own work to do, and if one got a new wrinkle the other would adopt it and go it one better. As to the practice of pharmacy here, he thought it was equal in many respects to the state of pharmacy abroad. He thought it little less than surprising that pharmacists had not organized more. It was not wise to make the druggist work so hard that he could not have any leisure. He believed that the degree of Doctor in Pharmacy ought to be given as well as the doctor's degree in the intellectual pursuits.

President W. F. Sawyer, of the Massachusetts College of Pharmacy, spoke for that institution. In the past it had simply had no existence, but during the past few years it had strengthened wonderfully, and he predicted that a laboratory of research in connection therewith would be a fact in the next few years. President Sawyer said that the college had helped the trade considerably, and the laboratory would enable its members to make their own chemicals. He predicted that within the next generation the college would be fully recognized as a part of the educational mechanism of the state.

The pharmaceutical press was toasted, and Mr. Caswell A. Mayo, of the American Druggist, responded. He admired the broad-gauge manner in which the Boston Druggists' Association was run—not burying itself in the business, but reaching its influence out into the state and the nation. There were two necessary points about the pharmaceutical press, accuracy and promptness, and he thought the press had lived up to these necessities.

Mr. D. O. Haynes, of the Pharmaceutical Era, after stating that there are thirty-one publications claiming to further the interests of the drug trade, went on to give some of the causes for the establishment of so many—the low rates of postage, the desire of manufacturers to have a paper of their own to advertise their special wares and nothing else, etc. The effect of all this mushroom class of journals has been to weaken all, as the trade cannot possibly support so many. It is in the hands of the druggists to apply the remedy, said Mr. Haynes. Let them be more discriminating; let them give to publishers of a few of the best journals the benefit of their ideas as to how the papers should be conducted, and encourage them to be progressive and independent. The house organs should be ostracized. Mr. Haynes spoke of some of the desirable features in an ideal publication—promptness in giving the news, accuracy in its trade departments, and utter impartiality in its editorial expressions, and predicted that if the druggists gave sufficient encouragement it would be found that there were publishers ready to meet the want in a perfectly satisfactory manner. In conclusion he spoke pointedly of "our old friend, the cutter," and the great injury he does to the legitimate drug trade.

In the course of the evening there were songs at frequent intervals by a glee club, Mr. Frank T. Neely, of Chicago, whistled in a marvelous and charming manner several selections, and a string quartette contributed music on mandolins and guitars. All in all, this dinner was one of the pleasantest the Druggists' Association has ever had since its formation.

THE DOLBER-GOODALE CO.'S ANNUAL DINNER.

The annual dinner of the Dolber-Goodale Company, the proprietors of Mellin's Food, to their heads of departments and traveling men, was given on the 6th of December, 1893, at the Parker House, Boston.

In response to the special invitation from Mr. Dolber, the president of the company, all of the traveling men had turned from their different fields of labor, and had come together in Boston, the headquarters of the business, each to make systematic and detailed report of his past year's work and to discuss with the home management the methods, plans and efforts for his coming year's work.

It was a most natural and happy home-coming, and seemed almost like a family gathering, as the freedom of discussion, the quick response to Mr. Dolber's request for suggestions, and the enthusiasm shown by all present, told of the cordial relations and perfect confidence existing between the travelers and the manager of the company.

At the dinner, Mr. Dolber, the president, had the head of the table; the vice-president, Mr. Cheney, the foot; Mr. Delano, the right, and Mr. Hazeltine the left center. Messrs. Cox, Snyder, Jones, C. M. Phelps, Hobbins, Larrabee, Stone and Goodwin completed the circle. The appearance of the table was strikingly novel, with its pyramid of foliage and choicest cut flowers, of which Mr. Dolber is so fond, and the menu and service were all that for two generations have made "Barker's" famous.

After the merriment which always accompanies a good dinner, speeches were in order, and as the Mellin's Food men are all good talkers and the dinner had been a success, there was no backwardness in coming forward to carry out this part of the programme.

Mr. Stone set the ball rolling with a toast to the president and the heads of departments, which brought out hearty and appreciative responses, first from Mr. Dolber, and following him the several members of his staff of assistants who are at the head of the different departments of the work in the home office; and then every one of the traveling men, as he felt moved to speak, gave to the others his ideas of the work from his own personal point of view, each telling his belief and conviction as to the best ways to accomplish the results desired under the widely varying conditions prevailing in their different fields of effort.

The last hour was devoted to a wholly unexpected and successful demonstration of the latent musical ability of the party. Messrs. Delano, Stone and Larrabee "spelling" each other at the piano, and music and song held sway until, with rousing and heartfelt cheers for Mr. Dolber and for Mellin's Food, these earnest and loyal co-workers separated, strengthened in purpose, each with greater confidence and increased zeal, to take up his own work again with the determination to accomplish all, and more if possible, than the management had expected of him, as a natural return for the confidence and compliment shown him in this meeting with his fellow workers and employer on common ground.

Perhaps one secret of the steady growth and increasing prosperity of the Mellin's

Food business is to be discovered in this incident. Mr. Dolber's breadth of view, honesty of purpose and perfect sincerity, which make him willing to listen to any and all suggestions that even the youngest and least experienced of his employees might offer, have no doubt kept the entire force of workers in intelligent harmony with those whose responsibility it is to direct them, and in this way better and larger and more permanent results have been secured.

There is no position in commercial life, as business is done to-day, so hard to sustain successfully as that of "traveler," for the reason that it is possible for him to find himself so quickly "out of touch" with the home people. He wants to carry out their ideas, and intends to do so, but too often confusion and misunderstanding arise from the care of the work of the traveling men having been given to an irresponsible correspondent who is personally impatient of anything but routine work and is not interested in the ideas and suggestions of the men who, in their different fields, are in reality the very pulse of the business.

No clearer and more unmistakable instance of Mr. Dolber's sagacity and sound business judgment can be asked for than the fact that to the work of, and correspondence with, the traveling men, he delegates the best thought and ripest experience among his associates in the management of the business.

The Clarksville Drug Co., Clarksville, Tenn., has made an assignment for the benefit of its creditors.

F. J. John, a Homestead, Pa., druggist, has retired from the retail business and accepted a position with W. J. Gilmore & Co., of Pittsburg.

H. S. Northrop, the deceased member of the drug firm of Northrop & Lyman, Toronto, Ont., left a will disposing of an estate of \$685,000. The property is divided among relatives.

A. E. Klesling, late of the firm of Hertz & Klesling, druggists, Houston, Tex., has purchased the Lankford drug store in the same city. He will cater to the prescription trade.

J. L. W. Huntington, a well-known citizen and druggist of Norwalk, Conn., died December 17 of heart disease. He was an energetic collector of antiques and Indian relics.

Dr. P. T. Rogers, one of the oldest and most widely-known druggists in Southern Kentucky, died at his home in Hopkinsville recently of pneumonia. He was about 60 years of age.

R. H. Kemp, a druggist of Trappe and one of the leading business men of Talbot Co., Maryland, died December 29, 1893. He was 55 years of age, and had been in failing health for some time.

H. H. Johnson, druggist in charge of Martland & Anderson's pharmacy, Slouss City, Ia., committed suicide December 29. He was a young man who had always borne a good reputation, and no motive can be ascribed for the deed.

James R. Fisher, for many years engaged in the drug business in Virginia, and later assistant librarian to the House of Representatives, Washington, D. C., died in that city December 29, of typhoid fever. During the war he was connected with the Medical Purveyors' Department of the confederate government, and one of the most prominent Democratic politicians in the State of Virginia.

NEW YORK.

New York, January 25.—The past two weeks have been eventful ones, with an unusual number of deaths and casualties.

The pharmaceutical profession has suffered a great loss in the sudden death of Dr. Oscar G. Harrison, instructor in botany, pharmacognosy and materia medica at the College of Pharmacy. Dr. Harrison was a graduate of both the College of Pharmacy and the College of Physicians and Surgeons. He was assistant at the College of Pharmacy to Prof. Rusby, who held him in the highest esteem, personally and professionally. He was ill but a few days and nothing serious was thought to be the matter until within a day or two of his death, when appendicitis developed and had gone so far that an operation failed to relieve him. The day of his death he had seemed to be better and had rallied considerably; strong hope was then entertained of his recovery, but it was but temporary, and on Sunday evening, January 14th, he passed quietly away. His wife was at his bedside throughout his illness, and is completely prostrated by his death. They had been married but a few months. The doctor had made a special study of vegetable histology, and had contributed a number of very valuable papers on this subject. He was also assistant to Professor Wilcox at the Post Graduate Medical School. The senior and junior classes at the college passed resolutions of regret and attended the funeral. The college, at its last meeting, also passed resolutions of regret and a large number of its members attended the funeral. Dr. Harrison had just been unanimously chosen editor of the Alumni Journal of the college. He was of a genial disposition and had the faculty of making many friends, who express their deepest regret at his untimely death.

Sidney A. Schieffelin, formerly in the wholesale drug business in this city, died at his home in Geneva, N. Y., on Sunday, January 21st, in the 70th year of his age. He had not been in active business since 1865, having retired at that time from the firm of Schieffelin Bros. & Co., which was succeeded by the present firm of W. H. Schieffelin & Co., he being an uncle to the present W. H. Schieffelin. He was well known throughout the country for his many charitable acts, and leaves a large circle of relatives and friends to mourn his loss.

Dr. E. Tiesler, medical examiner for the State Board of Medical Registration, of New Jersey, died recently. He was well known in pharmaceutical circles, having conducted a pharmacy at Orange, N. J. He did much to advance the cause of pharmacy in his state. He was a member of the different pharmaceutical and medical associations.

In the terrible collision on the Delaware & Lackawanna Railroad, January 14, was Carl H. Schultz, son of the well-known manufacturer of mineral waters in this city. He was very badly injured and, it is said, cannot recover. He was accompanied by his brother Walter, aged 14, who was also badly injured, but not seriously.

Louie Bodine, of Summit, New Jersey, a former student in pharmacy and now attending the College of Physicians and Surgeons, was also a victim of the D., L. & W. R. R. accident; he was cut about the head and face, but not seriously.

The annual ball of the German Apothecaries' Society was held at Katona Hall, 16th street and 3d avenue. There was a large attendance of those connected with the pharmaceutical profession. Carl Arne-man acted as master of ceremonies and chairman of the floor committee. After the order of dance reached No. 7, intermission was had for supper, which occupied about 2½ hours. The usual number of toasts were given and responded to by the members and their friends; after this dancing was again resumed. The affair lasted until about 6 a. m. Among those present were: Carl Arne-man, H. L. Behrens, Victor Kostka, Edward Pfaff, John Pfeiffer, Mr. Alexander, of Alexander & Vandermissen, A. G. Hoffman, Mr. Vogt, Mr. Schleussner, Fred Hohen-thal, W. T. Lins, Messrs. Tsheppe, Schur, Fleischer, Schlenrmann, Hugo Smelz, Carl Wurn, F. Kronsberg, Hatteman, Otto Von Besser, O. A. Leichster, Geo. T. Reafflin, F. W. Fink, George Strauss, J. Kalman.

T. Felix Agne is now at Ed. Lapid's Tompkins Park pharmacy.

Edward Hirzel is now representing H. J. Winsler in New York City.

B. M. Douglas, western salesman for Delletrez's perfumes, was in town for two weeks.

A. S. Brooks, of Williams, Davis, Brooks & Co., Detroit, has been visiting this city.

John A. Wellington, southern representative for Sharp & Dohme, was north recently on his wedding trip.

A. P. Lohness, Phar. D., has been elected director of the pharmaceutical laboratory in the Brooklyn College of Pharmacy.

W. A. McIntire, Ph. G., has been appointed laboratory assistant to the chairs of organic and inorganic chemistry in the Brooklyn College of Pharmacy.

F. W. Koch, of Lehn & Fink, and editor of Notes on New Remedies, was a victim of the prevailing malady, la grippe, and was confined to the house for a few days.

W. J. Wilson has been appointed laboratory assistant to the chair of pharmacy. H. W. Barts has been appointed assistant to the chair of botany and materia medica.

John Pfeiffer, 241 Nostrand avenue, Brooklyn, owing to the large increase in his business, has taken his son into partnership, and the firm's name now reads Pfeiffer & Son.

The Union Chemical Works, whose main office is at No. 15 Cedar street, has gone into the hands of a receiver. The liabilities are placed at \$290,000, and the assets at \$136,192.

Paul Monlun, manager of the American branch of Delletrez perfumes, was a victim of la grippe, but has entirely recovered and is attending to business as usual.

Hudnut's Pharmacy, 218 Broadway, N. Y. Owing to a mistake upon the part of the cut-rate committee. The black list gave the address of Hegeman & Co. They have no interest in this firm. Hudnut's have always been known for high prices instead of cut rates, and Manager George Bancroft does not enjoy being classified as a cutter.

On Thursday evening, January 9, an impromptu entertainment and reception was held at the Brooklyn College of Pharmacy. Stereopticon Views of the World's Fair and Mexico were shown. Dr. Hunt also delivered a very interest-

ing discourse on "Pulque, the Mexican Drink." Music was rendered by the college quartet, refreshments were had, and Dr. J. F. Golding entertained the company by one of his famous after-dinner speeches.

The annual exhibition of the department of microscopy of the Brooklyn Institute was held on January 15. Prof. H. W. Schimpf, of the Brooklyn College of Pharmacy, exhibited crystals of sugar polarized. Dr. Jos. Hunt, professor of botany at the Brooklyn College, exhibited a section of the ovary of the poppy and a section of rattan; Dr. Smith Ely Jalliffe, instructor in botany and materia medica and director of the microscopical laboratory of the Brooklyn College, showed the impurities in the Brooklyn water supply.

The regular meeting of the New York Branch, Interstate League, was held on January 16. The meeting was not as large as expected, but what it lacked in numbers it made up in enthusiasm. The next meeting will be held January 30, when steps will be taken to get all the members out and to make arrangements for the regular League meeting, on February 6. President Chas. A. Osmun is working hard for the success of the League, and the drug trade should respond more quickly and attend the meetings regularly.

Two cases of alleged violation of the pharmacy laws were tried before Judge Burke at the Harlem Police Court, January 23. The accused were Chas. F. Dahan and Theodore Arndt. Both were held in \$100 bail for trial in special sessions. The examinations in both cases were held privately. Theo. Arndt, whose store is located at 112th street and Columbus avenue, was arrested on a warrant sworn out by the inspector of the Board of Pharmacy, charging him with employing an unlicensed clerk to compound prescriptions, in violation of the law. The clerk, when asked to show his license, refused to do so, but told the inspector the date of his license and said his name was Kuno Uden. It turned out his name is Boyoslevsky. Kuno Uden is now employed at 10 Greenwich street, and was produced in court and testified that his certificate had been taken away by Boyoslevsky, who formerly worked there. Arndt admitted he did not inspect the clerk's license, merely asking him if he was licensed. He also claimed that the prescription was put up under the supervision of a physician, which the Board claim did not entitle him to relief, as the physician was not registered. The clerk, who was traveling under an assumed name, is still at large, but it is said the authorities have him under surveillance.

The second case, Chas. Dahan, is said to be somewhat complicated by political influence. The accused man's store is at 127th street and Lenox avenue. Efforts have been made, the inspectors say, to have the case settled out of court, and he is said to have strong influence with the authorities. He claimed he had not asked his clerk to show his license, but supposed he was registered. He was first notified in June that he was violating the law, but he failed to discharge the clerk until he found that the matter was going to be pushed. The clerk has disappeared, and collusion on the part of the authorities is claimed by the Board of Pharmacy, as one of Dahan's bondsmen was the father of the clerk.

PHILADELPHIA.

Philadelphia, January 25.—The Society for the Prevention of Cruelty to Children, aided by the police, is about to institute a crusade against pharmacists who, in their judgment, improperly sell laudanum without due regard to consequences. The agitation this time has been stirred up by the discovery that a 17-year-old girl has succeeded, as she claims, during the past two years, in buying laudanum over 700 times in quantities from half an ounce to two ounces. The girl was found one afternoon in the ladies' waiting-room of a commercial establishment apparently in a dying condition. At the Philadelphia hospital she confessed that she had taken laudanum and chloroform with suicidal intent. She was a resident of this city and gave the address of her parents. Her father stated to the police that he had been unable to break his daughter's indulgence in opium and had no idea where she contracted the habit. She said that she never had trouble to get as much laudanum as she wished at any drug store, whatever section of the city she happened to be in. This tale is what has started the society's agents on the war-path, although no arrests have been made as yet. If the laudanum sold is properly registered the sale is of legal character.

Mrs. Elizabeth Duhling, of this city, who a few days ago brought suit against Druggist Hallowell, claiming that a preparation of face powder purchased from him had poisoned her blood, ruining her complexion, has lost her case. Mr. Hallowell had expert testimony in Common Pleas Court which no jury could withstand. He claimed that there was no deleterious substance in the mixture. To strengthen his case he had a bevy of pretty girls in court who stoutly maintained that they had used the same powder for years and their complexions had been enhanced in beauty in consequence, with no injurious effects to their health. The jury then returned a verdict for the defendant.

Henry Dalley, Jr., secretary and treasurer of the committee appointed by the manufacturing perfumers to devise means to circumvent any hostile legislation by congress, has sent a lengthy circular letter to the different manufacturers. The committee have received from some of the trade intimations, and in some cases statements of the fact that individual firms have secured the services of special representatives in Washington, who are looking after their individual interests. It is apparent that the interests of the business at large will be much better served if the whole trade acts as a unit when it comes to influential work, either in the House or Senate. This will avoid complications and ambiguity of statements, which though not different in fact, are presented in different ways by different individuals. The circular states that all are of one mind, as to the maintenance of the present rate of duty on imported alcoholic perfumery, and seek in common interest to prevent interference with this present rate or substitution of any other duty therefor, unless indeed it may be the old rate. The committee has given the matter most careful thought and have not been slow in taking action. The committee is now represented in Washington by a gentleman of large experience in public affairs, with a wide

acquaintance amongst influential men. The plans of the committee have been carefully laid and are now being carefully and effectively carried out. They comprehend the accomplishment of more than has been referred to above, and there are good reasons to hope for success.

The Kearsbey & Mattison Chemical Company at Ambler is now charged by the postmaster of that place with boycotting him. The postmaster claims that the firm purchased its stamps elsewhere because he did not favor the removal of the postoffice building to the opera house owned by the chemical company across the railroad. The salary of the postmaster is regulated by the number of stamps he sells and in consequence it has greatly fallen off. During the months of April, May and June, immediately preceding the boycott, over 45,000 stamps per month were sold on the average at the postoffice at Ambler. Less than 1,200 was the average for the three months following. The postoffice officials at Washington are now looking the matter up. Dr. Mattison, the president of the chemical company, said the contemplated removal of the postoffice to the opera house had nothing to do with the boycott, although he stated that in his judgment the office would be more conveniently situated there. In the doctor's opinion the proceedings were justifiable by the inability to obtain improvements in the Ambler postoffice.

The feature of the January pharmaceutical meeting held in the assembly room of the Philadelphia College of Pharmacy, on the 16th of the month, was a talk on "Vaccine Virus," by Dr. H. M. Alexander, of Marletta, Pa., who has studied the mode of preparation of this therapeutic agent in all its details. Photographs showing the manner in which cattle are cared for and afterwards treated in the preparation of the virus were exhibited. Dr. Alexander referred to the opposition with which the virus met when first brought out as a preventive of small-pox and then to its introduction into the United States in 1870. Much of the propagation, he said, was done under dangerous circumstances. Cattle were housed in filthy stables entirely unfit for the animal from which such an important result was desired. This practice of not keeping the live stock in proper quarters, he said, is still in vogue among those who make virus for the sole purpose of selling it without protecting individuals using it from contamination or the introduction into their systems of dangerous diseases productive of ulcers. He urged that propagation be carried on in the country, where healthy animals, good food and clean stables can be had without trouble. He advocated the use of heifers from one to two years of age, instead of stock-yard cows, in making operations.

Dr. Alexander then described the methods of fastening the animal, which could be done in less than five minutes from the time it was brought from the stables. He laid stress on the point that the heifer should not be made angry nor anything done to increase its temperature, for the product would be injured. The process of preparing the vaccine points was illustrated. Dr. Alexander favored the plan of obtaining virus from families of sound animals and their progeny. European propagators who visited the Columbian Exposition, he said, had admitted that,

even after careful inspection, tuberculosis had been found in cattle operated on and then slaughtered. Rate cutting was pointed to as an evil which is responsible for some of the worthless virus now on the market. The reprehensible practice of adding a trace of croton oil to the virus, to insure soreness, has been detected. Ulceration is seen by the physician, who mistakes it for a genuine scab, and is satisfied, meanwhile the patient is worse off than if he had not been vaccinated at all. Good virus, it was said, is not injured by age if kept in a cool place. A temperature of 103 degrees Fahrenheit is the highest point of safety. In commenting on the demand for colorless points, Dr. Alexander said that there is no trouble to meet it in abundance, only there will be a smaller quantity of virus furnished as a result. The difference in color was due to the difference in quantity.

The internal treatment recommended by some doctors, in which the virus is swallowed in small doses was ridiculed. At the conclusion of Dr. Alexander's remarks he was asked many questions by the students and pharmacists present, who were well pleased with the instruction afforded them.

Mr. Harold C. Barker read a paper on an analysis of pycnanthemum lanceolatum, with notes on its essential oil, giving the result of carefully conducted laboratory experiments. Prof. Trimble had a number of interesting specimens of drugs and chemicals to exhibit, additions to the college's museum, among which was the Japanese calomel, already described in the Era.

Mr. Galbraith has bought out the drug store of James G. Wells, at Ninth and Spring Garden streets.

E. E. Bostwich has sold through F. E. Engelman his store, 104 North Second street, to E. J. Finnerty, late of the firm of Finnerty, McClure & Co.

The faculty of the Medico-Chirurgical College have created three new chairs, as follows: A chair of otology, one of orthopedic surgery and one of genito-urinary diseases.

M. P. Lind, of the firm of Schandelin & Lind, manufacturers of Garwood's standard perfumes, is on the road again. This trip is to be a short one, as only the trade of Baltimore and Washington are to receive his attention.

Mr. Theodore Maris, who is a jolly good fellow, as well as an excellent business man, says that during the last six weeks there has been an unusually large demand for hot water bottles, due, he thinks, to the grip. His patent tooth-powder bottle, No. 602, is having a large sale. A paper in Germany saw a description of this bottle and gave the manufacturers a good puff.

Notwithstanding this is considered the age of progress, it is not apparent to an observer if he watches the various orders for druggists' supplies. John M. Maris & Co., which is one of the largest houses of this description in this city, frequently receive orders for goods the counterpart of which were in use over 50 years ago. While the orders are generally from the west and southwest, there are a number of home druggists who cling to the articles which were in use during their grandparents' time.

For several years there has been an effort made to secure a uniform price for Paris Green. A few days ago a meeting of the Paris Green manufacturers and members of the N. W. D. A. was held in New York to devise some plan by which the long sought for scheme could be carried out. M. N. Kline, of this city, was in attendance, and he thinks that good results will follow the meeting.

Robert McKinley, who for a number of years has been in the receiving department of Smith, Kline & French Co., has departed this life for a better one. Mr. McKinley was employed for many years by Wm. Gulager, who, in speaking of him, said: "He was the most conscientious man I ever saw. Honest as the day is long, and ever watchful of his employer's interest."

On January executions were issued against the Philadelphia Optical and Watch Company, of 916 Chestnut street, of bonds and warrants aggregating \$239,262 55. Foreign attachment proceedings were also begun against the company by a number of firms, in which bail was fixed in each case. A similar action was also begun by Charles C. Harrison, in which three lots of ground at Forty-second and Mantua avenue were attached.

In speaking of the trade situation Mr. Kline said: "Our business has been very good for the past six weeks, but it is now beginning to slacken. I think the main cause for the activity was due to the large number of sick people, nearly all of whom traced their illness to the grip." Mr. Kline will be a guest of the Boston Druggist Association at its annual banquet January 23, and will respond to the toast, "The International Drug Association."

The Pennsylvania State Pharmaceutical Examining Board held a meeting in the Central High School of this city on Saturday, January 20. About half of the senior class of the college was present for examination for registration, and some juniors were also in attendance. The test of their knowledge was a "feeler," in a way, as to how they had benefited by the winter's college course, and a mental inventory was taken by each individual as to his chances for passing the final spring college examinations.

James Good, manufacturer of carboric and tar soaps, has a tar soap now which he claims to beat anything on the market. He is so confident that it cannot be beaten that he is willing to make a novel wager. He will fill the gray whiskers on his face, which the wind has trickled through for a number of years, with pine tar, provided another maker of tar soap will do the same, and he bets that his soap will remove the tar from his whiskers better than the soap of the contestant will remove the tar from his.

At a meeting of the faculty of the Jefferson Medical College on January 9, it was unanimously decided to extend the course from three to four years. Similar action has been taken by the faculty of the medical schools of the University of Pennsylvania, where the four years' course is now in effect. The State Board of Medical Examiners, from which all physicians must secure a diploma before they can practice, has announced that after 1898 they will not recognize or receive for examination any graduate from a school having a three years' course.

DETROIT.

Mr. Harry T. Carver, of Farrand, Williams & Clark, of this city, is the possessor of a relic of the by-gone days of the drug trade in the shape of an old price current issued by Henshaw & Co., No. 33 India street, Boston, dated September 20, 1829. In transmitting it the firm say: "We herewith hand you a list of articles with our six months' prices annexed, and should be happy to execute your orders for such articles as you may find it to your interest to purchase of us. It usually occurs that in executing an order we are enabled to place many articles on the invoice at a less price than quoted. Should you wish to purchase on a longer time than six months, we can extend the time by adding interest." The price list shows the great difference in prices which time has caused in the drug trade. Alcohol is quoted at 56 cents per gallon; citric acid, \$5.50 per pound; carbonate of magnesium, small squares, \$1.50 per pound; elaterium and emetine are quoted at \$8 and \$9 respectively; gum opium at \$1 per pound; morphine sulphate, \$12 per ounce; olive oil, 92 cents per gallon; castor oil, \$1.60; peppermint, \$1.12; piperine, \$7 per pound; quinine sulph., \$2.75 to \$3 per ounce; strychnine, \$23 per ounce. The line of patent medicines includes 28 items, the most prominent of which are Wheaton's Bitters, Swaim's Panacea, Indian Specific, Steer's Opodeldoc, Lee's, Jewett's, Dean's, Mead's, Anderson's, Hooper's and Davenport's pills. No change is noted in the prices (?) of these goods, their value being as great to-day as ever. Assorted white phials, English, are listed at \$3.00 per gross, and American, green, at \$2.75. A half-pint graduate cost \$1 in the olden days, while a pint measure cost \$1.67.

F. Ducat has bought the drug store of J. J. Harrah, corner Williams and Myrtle streets, and moved his stock to Twenty-third and Myrtle streets.

F. E. Clough, for some time prescrip-tionist for A. S. Parker, Woodward avenue, has entered the employ of T. H. Hinchman & Sons as traveling salesman. He is succeeded with Mr. Parker by C. H. Marion.

William E. Eberbach, son of Christian Eberbach, Ann Arbor, died January 25th, of consumption. He was 39 years of age, a graduate of the class of '88, Department of Pharmacy, U. of M., and was, until failing health prevented, engaged with Eberbach & Son. He retired the evening previous to his death feeling as well as usual, and was found dead in the morning.

The Brown Pharmacy Company has been incorporated with a capital stock of \$10,000, one-half paid in. The shares are to be owned as follows: Wm. J. Brown, Detroit, 25; Jas. G. Donley, Detroit, 475; Geo. W. Brown, Port Arthur, Ont., 500. This concern will operate the business which has been carried on under the name of Brown's Pharmacy.

It was incorrectly stated in the January 1 issue that Judge & Whitmarsh, corner Grand River avenue and Twelfth street, were succeeded by R. H. Whitmarsh. For R. H. Whitmarsh it should have read S. P. Whitmarsh, who a few days since succeeded in disposing of the property and good will to Chas. Moorland, who will continue the business at that location.

CHICAGO.

Chicago, January 25.—An explosion in the drug store of the American Pharmacy Company at State and Congress streets, at noon, January 19, burned Louis Mendel, a clerk, and damaged the stock of the concern to the amount of \$1,000. It is thought the explosion occurred as the result of a considerable leakage of natural gas from a stove used in the store. Immediately after the explosion Mendel rushed from behind the prescription counter, his clothing being on fire. Before the flames were extinguished his eyes, face and limbs were terribly burned, and in some places the skin peeled off. He was taken to a physician's office and his injuries given attention. They are not considered fatal. Manager Reeves of the Pharmacy Company was also slightly burned. The firemen had no trouble in confining the blaze to the rear portion of the store.

L. C. Hogan, the Englewood druggist, has been elected president of the State Board of Pharmacy.

The Chicago salesroom of the Charles Lippincott Co., so long at 34 Dearborn street, has been removed to 264-270 5th avenue.

In common with all other branches of business, the retail drug trade of Chicago has been liberal in contributions to the fund for the relief of the unemployed and sick poor.

Druggist L. K. Waldron is in ill health and is absent on an extended holiday. He will take in the Midwinter Fair at San Francisco, and it is rumored that he may buy a winter home in California.

The Simmons Cigar Co. succeed the old firm of Simmons, Neumann & Co. Mr. Neumann withdrew from the firm January 1st, and has since started in business for himself under the name of Louis Neumann & Co. The latter firm occupy the same building that Simmons, Neumann & Co. formerly did.

The work of installing the specimens in the Field Museum, which is to occupy the Fine Arts building at the World's Fair grounds, is progressing rapidly. The entire floor space available for display purposes aggregates 225,000 square feet, and over 30,000 square feet of this will be used for the botanical department.

Henry S. Wellcome, of Burroughs, Wellcome & Co., London, Eng., formerly of Indiana, has decided to present to the Senate of the United States the portrait of Pocahontas which hung in the library of the woman's building during the exposition. This portrait of Pocahontas was painted from life after she was converted to Christianity and became Mrs. Rolfe.

A delegation of liquor dealers called upon Mayor Hopkins, January 10, and complained of the sale of liquors by drug store keepers and retail grocery store proprietors. The Mayor promised to look into the matter and gave instructions to the Chief of Police to make a census of the saloons of the city. The delegation presented the Mayor a list of more than 500 places where liquor is sold without a municipal license. The Mayor said he would have them carefully examined.

In Louisville an order has been issued to policemen that they shall not drink liquor in drug stores.

ST. LOUIS.

St. Louis, January 22. There is no talk about either the wholesale or the retail trade being good. Our representative wholesalers and retailers do not talk enthusiastically about the condition of business, but they are hopeful.

As a rule, when a new year begins, tradesmen feel encouraged, but this year (1901) is an exception. There is too much general depression throughout the whole country for the drug trade not to feel it.

With a relaxation of the stringency, financially, there will be a speedy awakening in business. Retailers are in need of goods, but they are not anxious to buy and carry them, and the wholesalers are not pressing them to buy.

A ripple of excitement pervades local drug circles over the coming meeting of the Interstate Retail Druggists' League. The president of the St. Louis Apothecaries' Association, under date January 13, addressed a communication to the president of the St. Louis Wholesalers' Association, asking for a conference between a select few of the retailers and the wholesalers, that their representation at the coming League meeting, whether by delegate or written communication, might be as intelligent as possible, but at this writing, the 20th, no response has been received. The Detroit plan is believed by some to contain evidence of a departure from old customs by proprietors and wholesalers, and kindly permits the retailer to share some of the protection from cut rates they themselves have enjoyed these years past; while others have no confidence in the movement, shake their heads, and refer to past resolutions of the N. W. D. A., and point to their shelves in a significant way, indicating an early divorce from patent medicines.

Many drug stores are now conducted differently from former practices, they refusing to handle almanacs or any advertising matter whatever of proprietors whose goods are sold by "cutters." The noticeable absence of the enameled letters so conspicuously displayed up to a recent date on the plate glass windows of drug stores is another feature of silent and unrelenting war.

Thomas Layton, the Grand avenue druggist, in a correspondence to Meyer Brothers' Druggist, says concerning the Interstate League meeting, to be soon held in New York:

"The 'Detroit plan' will be the all-absorbing question when the delegates are assembled. . . . The interests of the wholesale and the retail druggists are inseparable, and neither can afford to do that which would work an injury to the other. The proprietor cannot well afford to do that which would antagonize either, and dare not antagonize both. Any reasonable demand made by both wholesaler and retailer must and will receive attention. The concessions recently made by the proprietors (and when I say concessions I mean limiting the sales of their products to the retailer druggist) are, for a mainly the result of the unselfish efforts of the wholesale druggists. It has been the opinion of the writer for several years past that relief from the dry-goods drug stores and the scaling to decrease the same through the united efforts of the three branches. Antagonize either and all plans will fail. This occurs to me to be an opportune moment for the retailers of St. Louis in particular, and the entire country in general. . . . The time is near at hand when the proprietor will no longer be content to decrease the scalper in order to make you fellows hustle, provided 'you fellows' will hustle just a little in your own behalf. The wholesale trade now stands ready to bear

any reasonable request and join with you in a request to the proprietors, which, if tempered with reason and justice, will be cheerfully granted. The League and its little platform are all right and certainly deserve your encouragement. . . . Let us all get together under one common banner and fight for one common cause. The wholesalers and proprietors will be our allies."

The St. Louis College of Pharmacy Alumni gave their annual ball Saturday night, January 20th, at the Liederkranz Hall, and it was a grand affair and a perfect success. After a programme of 20 numbers, performed to the music of Saenger's Orchestra, supper was served a la carte, and the merry-makers went away happy. The ball was under the management of the following persons.

Executive committee—Chas. A. Lips.

Welcome committee—E. J. Ernst, Alb.

Unwelcome committee—E. J. Ernst, Alb.; F. Funsch, Wm. H. Lemmon, J. F. Schoettle, W. H. Kahre, Theo. F. Hagenow, Louis A. Fisher and E. A. Winkelman.

Reception committee—Dr. J. C. Falk, Prof. O. A. Wall, Dr. Chas. O. Curtman, Dr. A. H. Slippy, Dr. Enno Sander, Chas. Gietner, Prof. J. M. Good, Prof. Francis Hemm, Dr. O. E. Treutler, Dr. F. A. Temm, Dr. H. L. Goodman, Dr. Huko W. Kohler.

Floor committee—Louis Schurk, J. A. W. Fernow, Oscar F. Bausch, Henry Hassenbrock, Benj. Otto, O. F. Heltmeyer, S. E. Barber, Wm. C. Waldeck, L. C. Behrens and Wm. E. Angermueller.

Musical director—Wm. C. Bolm.

A revival meeting and the apothecaries have got mixed up at Nevada, Mo., Rev. W. J. Carpenter, in one of his sermons, touching on the subject of Sunday opening. He said that the druggists had consented to close on Sunday, with the exception of one man, and turning to Judge D. P. Stratton, who was seated in the audience, Rev. Carpenter said: "Judge, I will appear against that man when the grand jury meets again."

Dr. Seward A. Finney, the late and popular secretary of the St. Louis Board of Health, has fallen beneath the Grim Reaper's scythe. He died January 13, at Santa Fe, New Mexico, whither he had gone in search of health. Consumption was the cause of death. Dr. Finney had many friends in the pharmaceutical world, and numerous resolutions of regret and condolence have been adopted by different organizations. The remains were brought to St. Louis, the funeral taking place from the residence of his father, Judge John D. Finney, No. 335 Sheridan avenue; interment in Bellefontaine Cemetery. Dr. Finney was 31 years old and leaves a wife and two children.

Health Commissioner Homan's monthly report for December says that during the month there were 909 deaths from all causes, of which 248 were under five years of age. This shows a decided increase over the mortality for November, which was only 790. In December, 1892, however, the deaths reached 1,142. The present report shows that 152 persons died of pneumonia, while phthisis pulmonalis claims the next highest number of deaths—96. Bronchitis claimed 57 victims and senility 46. Typhoid fever carried away 11 persons. Diphtheria claimed 18, while cancer and malignant tumor carried away 25. Thirty-seven persons succumbed to la grippe, and 35 to convulsions and trismus. During the month there were 13 suicides, 4 deaths by homi-

cide and 19 deaths by accident. The number of births reported for the month was 1,319, an increase of several hundred over the number of deaths.

The St. Louis Paint, Oil and Drug Club held its regular monthly meeting and banquet Thursday evening, January 18, at the Mercantile Club building, with a large attendance. Rabbi Samuel Sale delivered an interesting discourse on "Single Tax," which was followed by the reading of a paper on "Cranks," by W. M. Schuyler. While the club giving the usual attention to the business interests of its members, this season is by no means confining itself to them exclusively, and has taken up social and economical questions of national importance. The club favors the addition of a Secretary of Commerce to the President's Cabinet, and also desires the speedy passage by Congress of a good bankruptcy law. As a result of the discussion of these interesting questions the attendance has been unusually large.

The first case of small-pox in St. Louis since 1891 was discovered at the City Hospital January 13. The victim is John Floyd, an Englishman, 25 years old, Floyd was immediately transferred to Quarantine Hospital and given treatment. He is reported to be doing nicely and will probably recover. The dread disease has not invaded St. Louis unexpectedly. Several months ago Health Commissioner Homan, as a precautionary measure, had all persons vaccinated who wished to be vaccinated. Something like 2,000 persons were vaccinated at the public schools and manufacturing establishments.

Dr. W. A. Fries, proprietor of the drug store at No. 152 South Broadway, was neatly victimized by a female counterfeiter a few days ago. The woman, who seemed of the refined sort, had made a number of small purchases and tendered in payment a \$10 bill; at least it looked like a bill of that denomination. The doctor gave her the necessary change, something over \$9. In leaving the store the woman seemed to be in great haste, and the doctor became suspicious. He examined the bill again and discovered that it was simply a \$1 bill raised to \$10. The matter was reported to the police. There seems to be a gang of women engaged in this sort of business.

A sensational story was printed in one of the St. Louis dailies a few days ago to the effect that Mayor C. P. Walbridge had been threatened with assassination. The threat was said to have been made through the mail. Mr. Walbridge emphatically denied the story. He said: "I have the utmost confidence in St. Louis citizens and do not believe they are of the Chicago type."

Dr. William Theodore Gempp, well known through his connection with the firm of Gempp, Miller & Co., manufacturers of medicated soaps, committed suicide by shooting on January 11. The doctor had been despondent for months owing to business difficulties, and had threatened self-destruction a number of times.

At a meeting of the Alumni Association of the St. Louis College of Pharmacy, held a few nights ago, Dr. Frank L. James delivered an interesting discourse on "Superstitions in Therapeutics, Ancient and Modern." His remarks were interspersed with his usual humor, which seemed to have a pleasing effect upon the large audience in attendance.

CINCINNATI.

Cincinnati, O., January 20.—The leading theme among the druggists of this city and vicinity is the sale of adulterated drugs. It is alleged that Food and Drug Commissioner McNeal is after the local pharmacists with a sharp stick, but the latter claim their business will stand the very closest scrutiny. In an article appearing in a local morning paper a few days ago it was said that the following are some of the results of the analysis which are contained in Inspector Jennings' report to Food Commissioner McNeal:

Cream tartar—Grossly adulterated.
Alcohol—Diluted with water.
Salol tablets—Short weight.
Borax—Not pure.
Epsom salts—About one-half strength.
Cinchona bark—Cheapest grade.
Opium—Exhausted, used before for tincture.
Spices—Adulterated with cheap grades meals and starches.
Cinnamon—Mixed with allspice and common oak bark.
Linsseed meal—Deprived of oil.
Quinine—Inferior quality and short quantity.

While the article has evoked no end of comment and caused endless discussion, the druggists are not in the least apprehensive. "Epsom salts—About one-half strength," said William Simonson, a well-known chemist. "Why, such a thing is ludicrous. Epsom salts, or sulphate of magnesia, is over 50 per cent water, consequently I think the State Inspector and his well-paid assistants are floundering around in something about which they know comparatively little." Other druggists spoke in a like manner on the same subject. The same paper published another item to the effect that "there has been a dispute of long standing between the doctors and the druggists over the matter of compounding prescriptions, and the feeling between the parties on either side has been very bitter. However, about two years ago concessions were made by both sides and harmony was restored. Since then, however, the doctors have been laying low but keeping their eyes open as to the character of the goods sold by the druggists on prescriptions. From time to time the doctors would compare notes and they made up their minds that the drugs sold were unfit for the purposes for which they were intended. The doctors among themselves were quite worked up over the matter and it is hinted that they were on the verge of calling the attention of the State Food Commissioner to the state of affairs, when that official stepped in and anticipated them by the sweeping investigation just accomplished. The physicians, therefore, are very much elated over the affair, as they hope that the action taken by the State official will have a marked effect for the better on the materials used in the future in compounding their prescriptions. They are a unit in commending the action of Commissioner Neal, and congratulating him on the good results that must follow. It is not unlikely that some expression of this feeling on the part of the physicians will find its way to the authorities at Columbus at no very distant day."

The last item received the same mark of disapproval as did the first as far as the druggists are concerned. The out-

come of the matter is awaited with some interest.

C. T. P. Fennel, Dr. Dickore and Messrs. Schmidt and Hoffman, all chemists of local repute, were in Squire Tyrrell's court last week making tests in some adulterated vinegar cases. The display of apparatus, together with the technical terms used by the disciples of the "hidden science" seemed quite a magnet, as a large throng was present for several days. Ex-Gov. J. B. Foraker was counsel for the State in these cases.

A committee appointed by the Academy of Medicine met recently to discuss the matter of making the Academy one of the strongest associations in the State. Dr. Comegys suggested that a banquet be given on the night of January 8, at the Lincoln Club Hall. All of those present agreed that that was the best way to get all the members together, and then the matter of legislation and other things could be argued. Every physician in the county, also those of Campbell and Kenton counties, Kentucky, will be invited.

The speakers of the evening will be Dr. Reamy, of the Ohio Medical College; Dr. N. P. Dandridge, of the Miami Medical College, and Dr. C. A. Reed, of the Cincinnati College. A large number of druggists will also be in attendance. An excellent musical programme will be rendered.

Harvey Striehorst, a clever young pharmacist, is now in charge of Voss' drug store at Twelfth and Vine streets.

John F. Haynes, formerly a well-known drug clerk of this city, is now filling a lucrative position with Fairchild Bros. & Foster in New York.

Dr. John C. Otis has established a neat and spacious office above his drug store at Sixth and Vine streets. The doctor is getting quite a practice.

John Fratz, the well-known druggist at George and Baymiller streets, who has been seriously ill, is much improved and his physician says he will fully recover his lost health.

John Keeshan, the veteran retail druggist, and his young bride are visiting friends and relatives in New York. The doctor expects to pick up a few novelties while in Gotham.

Louis Sauer, the druggist at Central avenue and Baymiller streets, has invented a new label case which for neatness and compactness excels anything yet seen in this vicinity.

E. P. Dehner, the young and energetic druggist at Seventh and Vine streets, has given a local firm the contract for entirely remodeling his store. The place will be entirely metamorphosed.

Albert Meininger has opened one of the finest drug stores in the city at Chase street and Hamilton avenue, Cummins-ville. Meininger conducted the drug store at Twelfth and Vine streets for several years.

George Kylius, the druggist at Liberty and Denman streets, was a "mark" for his friends, who last week were "kidding" him about an item in the Enquirer referring to his trained dog, which does everything save speak.

Some time during the night of January 17 burglars bored a hole in a rear door of H. F. Reum's drug store at Fifth street and Broadway, and reaching in unlocked the door. They then stole a bicycle, a lot of cigars and some cash from the money drawer.

CLEVELAND.

Cleveland, January 25.—An eastern representative has been in the city with a view of introducing a so-called coupon scheme among the retailers. The local trade has discountenanced this lowly money-making trick, and will oppose any like overtures in the future.

Several local druggists with social foreign connections have of late been importuned with all manner of inquiries as to the condition of the proprietary medicine business in this country, the opportunities for new articles, the cost of securing patents and copyrights, etc., etc., with a view of changing headquarters to America. It seems as if Germany, among other European states, intended to greatly restrict the patent medicine business through taxation and onerous acquisition measures. Most all of these letters refer to Chicago as a possible distributing point, which goes to show that the Columbian fair has done its duty abroad—

for Chicago, at least.

The Ohio penitentiary convicts will be vaccinated at an estimated cost of \$2,000.

Wooster Medical College has decided to build a new hospital, to cost about \$35,000.

A. A. Elliott, of Steubenville, is the new president of the Eastern Ohio Medical Association.

Dr. E. E. Beeman, of the Beeman Chemical Co., has gone to Jacksonville, Fla., to increase his avoirdupoise.

Gustave Tielke, the Detroit street druggist, is laid up with a broken arm and internal injuries inflicted by his horse.

Kent Humiston, of Columbus and Abbey streets, will shortly move to a more commodious store near his present location.

The city district physicians made 6,912 visits in 1893, and issued 8,029 prescriptions to 2,812 patients. The medicines cost \$618.37.

A representative of E. W. Hoyt & Co., Lowell, Mass., has been in the city for some time advertising Rubifoam and perfume.

Strong, Cobb & Co. have made quite a success with the "Frog Chasers" cough remedy, manufactured by the Columbian Medicine Co., Akron, O.

They say that the vanity of some adolescent "assistant pharmacists," commonly known as drug clerks, is only paralleled behind the hotel counter.

Drug clerks seeking engagements are warned against certain local employment bureaux, for they practice bare-faced fraud under the faulty law applying to them.

The Peruna Drug Mfg. Co., of Columbus, O., have built up quite a trade through constant advertising, but make a mistake in not recognizing class publications.

The Thirteen Club, composed of employees of Strong, Cobb & Co., enjoyed a dinner and social session at the Hollenden, January 17. The year's programme of work and amusement was also mapped out.

Edward Beckenbach, of Edward Beckenbach & Co., the Superior street druggists, was quietly married to Miss Jennie Hatch recently. So quiet was the affair kept that only a few of the trade knew of it now.

Fred Pelt, a local drug clerk, went to Wellington, O., the other day to collect some old claims. Fred formerly kept a drug store in the village. One debtor, en-

rogued by being dunned, had Fred arrested for selling liquor without a prescription. It's an ancient complaint, but Fred's in the hands of fanatics.

The Oil, Paint and Varnish Club, at its regular monthly meeting and dinner at the Hollenden, January 18, made arrangements for the establishment of an information bureau which will afford topics for discussion.

The Academy of Medicine held a meeting December 17 for the purpose of appointing a committee to inquire into the bills before the General Assembly providing for the creation of a State Board of Medical Examiners.

The Protective League, a local option organization of Wellington, O., has declared open war against the druggists. W. P. Near, of whom they aimed to make an example, was fined \$50 and costs for selling liquor without a prescription.

A "pl" in the transmission of the messages embodying the state incorporation news is responsible for the item relating to the Alliance Paint Co., in the last issue. The corporation will have nothing to do with paints.

A real live salamander inhabits the aquarium in E. A. Schellentrager's store on St. Clair street. The ugly lizard has proved quite an attraction and is worth his weight in gold. He was obtained from the fisheries exhibit in the "White City."

On January 10, Chas. W. Benfield, the tri-store druggist of the East End, appeared before the police authorities as complainant against one of his clerks, Fred D. Teeddale by name, who absconded with \$12 in cash and a \$50 express money order.

Meyer & Gleim's window displays in the Cuyahoga building are models of beauty and originality, and in keeping with the interior appointments of this modern drug palace. It is gratifying to know that window decoration has at last been recognized as an advertising feature.

William S. Furze, the druggist of 197 St. Clair street, driven to the wall by the hard times, made an assignment to Frank C. Friend for the benefit of his creditors. Liabilities will probably reach \$4,000, while the assets are only \$1,500. The Sheriff levying on the stock on a cognovit note of \$267 precipitated the failure.

When the State Health Board made vaccination compulsory it should have commissioned proficient practitioners. Innumerable cases of improper vaccination have been reported, and it behooves the authorities to remedy the evil at once. There are any number of ambitious druggists who could give this matter proper attention.

The Ohio druggist is verily a much harassed individual. To his many trials and tribulations has been added Haskell's local option bill, providing that every druggist must register every sale of spirituous and malt liquor made upon a physician's prescription, and that every citizen shall have access to such register. It goes without saying that the drug trade is impeding the progress of the bill with all means at command.

The removal of the unsightly fruit stand on the Public Square side has improved the exterior advantages of May's drug store not a little. The new semi-bay window affords the window-dressing clerk ample opportunities to bring out the firm's drawing cards. While the improvements made may cover existing wants, a

few recess or after-noon rooms or stalls would pay better than office rooms, for the city has an extra supply of the latter. "Mako" Urban, the urban druggist, tells the following joke: "Just before closing up, recently, a colored man entered my place, chattering as he was coming up: 'Yo parson asked me to come heah and git some wine for de communion service to-morrow.' 'What kind do you want?' asked I. 'Well, really, sar, I ain't particular, but my wife she is powerful fond of gin,' retorted the negro."

Three burglars entered the store of Schellentrager & Hoehn, corner Superior street and Norwood avenue, on the night of January 22, but were scared off by the approach of Henry Toeltmann, who sleeps on the premises. Although he fired three shots after the closely retreating forms, no blood was spilled. Supt. of Police Hoehn intimates that the burglars were more scared at the clerk's name than at this revolver practice.

The first birthday anniversary of the Cleveland Medical Society was held December 12 at the Hollenden. The following officers were elected for the ensuing year: President, W. H. Humiston; first vice-president, O. B. Campbell; second vice-president, W. E. Wirt; treasurer, N. Stone Scott; recording secretary, O. Thomas; corresponding secretary, J. E. Cook; librarian, J. L. Hess; censors, J. F. Armstrong, F. C. Scott, Herman Sauer, A. F. House, E. G. Carpenter.

The Cleveland Drug Store Fixture Co. has handsomely fitted up the new pharmacy of S. H. Lederer, corner Brownell and Prospect streets, with show cases of beveled glass and wood work of selected quartered oak. Lehn & Pflink furnish the sundries, powdered drugs and essential oils, patent medicines and perfumes come from Benton, Myers & Co., the show globes and shelf ware from Whitall, Tatum & Co., and a beautiful onyx fountain from J. W. Tufts.

Instead of Dr. Schlewand, as was at first supposed, Henry L. Payne, of 1657 Wilson avenue, was appointed to fill the position of Joseph Mellor, deceased. Mr. Payne is a graduate from Case School, and has been employed as chemist by the Otis Steel Co., of Washington, D. C. While there he also practiced in the U. S. chemical laboratory. Under the rigid laws governing the inspection of drugs and food the office of City Chemist has become quite important, and it needs a man of Mr. Payne's caliber to dignify it.

The committee on legislation of the Cleveland Medical Society have their hands full devising plans and means by which to push the Avery bill to a successful issue, for the Homeopaths and Eclectics are up in arms. The measure endorsed by the medical convention at Columbus in December was entirely non-partisan, while the Avery bill gives the Governor authority to appoint nine physicians to constitute a board of medical examiners and licensers, who shall be graduates of reputable medical colleges and who have practiced medicine in this state for ten years, but none of whom are connected with any medical college or school. In forming a medical board, the Governor will be largely influenced by his own prejudices and the advice of his friends, and as the Allopathic physicians are by far in the majority in the state, their prospects of controlling the entire board are transparent—hence the uproar.

PEORIA, ILL.

Hamilton Catlin represented Meller's perfumes, of St. Louis.

The editor of this journal asks how we like the new dress. Great!

B. T. Van Alen made his after-Christmas bow, with a line of Lundborg's perfumes.

J. S. Henry, formerly with Lazell, Duley & Co., now makes his appearance with a Crown Perfumery Co.'s grip.

Peter Bourscheldt, pharmacist on First street, was presented with a boy on January 16th; on the 19th his wife died. The sympathy of all our pharmacists is extended to him.

Chauncey Clarke, one of the proprietors of the distillery that manufactures Clarke's rye, was married in Arizona recently. His wedding trip extends around the world.

Wm. Kenyon, formerly of Singer & Wheeler, is now reported to be connected with Lord, Owen & Co., of Chicago. Frank Conway, of the sundry department, has taken his place and yanks the grip.

Wm. Ohl, the manufacturing pharmacist, not only pays attention to the preparation of elegant pharmaceuticals, but also to American politics. He is one of the pillars of the American Club, and not long ago visited Chicago with the intention of tendering an invitation to Mayor-elect Hopkins to attend the annual ball of the club of this city. Mr. Hopkins accepted.

Since the holidays business has been as stagnant as an old pool of prairie water. Every Republican blames the Wilson bill, and every Democrat blames the Republicans for it; with all the blame, the blamed thing requires some time to better it. The winter here has been one with a great many warm spots in it, and the prospect for ice is very slim. Although ice men claim to have enough left for the summer, they will pool, and up goes the price, while the price of ice-cold soda never moves up an inch.

Dr. J. F. Percy, of Galesburg, Illinois, lectured on "Vivisection" before the Peoria Scientific Society, Friday, January 11th. The lecture was practically the same as delivered before the Tri-State Medical Society last October. He dwelt on the benefits derived from the study of vivisection on the lower animals, especially the dog. In the minds of the masses, vivisection literally means cutting and slashing, regardless of pain, of the animal experimented on. But by the use of anaesthetics pain is avoided, and everybody who has any feeling for the dumb animals bears that in mind.

It is this time perfectly proper to announce that the Illinois Pharmaceutical Association will meet here this summer. All the members are invited to attend and a royal good time will be expected. It has been some years since the last meeting in this city. A great many carry pleasant memories of the past. All pronounce the meetings held here better than any others in the state. In the first place, we have a great city, not only in being on the map, but that we cut a figure when it comes to Uncle Sam's revenue; besides, it is the most beautiful city in the state. About the particulars of the meeting there will be more next time.

EVANSVILLE, IND.

Ed H. Nicheus has accepted a position with Benj. J. Bussing.

Alf. Levy, of Chicago, spent the holidays with his parents in this city.

Henry Dreyes has taken charge of the Gerard Pharmacy in the West End.

Secretary C. P. Beard, of the E. P. A., has ventured into the insurance business.

Tepe & Son, Second avenue and Columbia street, have dissolved partnership.

Louis Bessel, of the firm of Tepe & Bessel, was recently married to Miss Bertha Jack.

Geo. Haynie, the genial president of E. P. A. fame, has been appointed surveyor of customs.

Greer Bros., of 303 Main street, moved their stock to corner Walnut and Chestnut streets.

Chas. F. Foster, formerly of Greer Bros., contemplates the opening of a new drug store soon.

A new drug firm has sprung into existence in the Bomm Drug Co., which locates at 323 Main street.

Henry Tepe, the senior member of the firm, retires. Louis Tepe assumes charge and continues at the old stand.

The Daugherty-Crouch Drug Co., of St. Louis, continues to send its regular physicians among Evansville druggists.

Wm. Moog, formerly at Gerard's drug store in Indianapolis, has accepted a position with Wm. Weber, Seventh and Main streets.

Fowler, Dick & Walker, the great dry goods and notions firm of this city, intend to put in a full line of patent medicines, to sell at cut rate prices.

Ed. Giel, of Chas. Leich & Co., who was missing some few days, has bobbed up serenely, having been out on a still hunt in the wilds for game.

Wanted to know, the whereabouts of the gang of fishermen who contemplated the eruption of the Wabash River last fall after leaving Evansville.

A. Walter, doing business at 1621 Main street, has sold his stock of drugs to August Pfaeflin, a recent graduate of Chicago College of Pharmacy.

J. C. Mendenhall, formerly of J. C. Mendenhall & Co., manufacturers of the 3 C remedies, has opened a neat pharmacy corner Fourth and Oak streets.

Jos. Stammel, who has charge of the Wabash drug store, will visit his old home, Cincinnati, soon, with the intention of making a prolonged stay.

A. H. H. Steffert, formerly in the drug business in this city, but now a student at the Louisville Medical College, spent the holidays with friends in this city.

It is rumored that John Wytenbach, who has charge of Haynie's Pharmacy, will purchase the stock and good will of C. G. Schultz, corner Eighth and Walnut streets.

At the last regular meeting of Drug Clerks' Union No. 46 it was decided to celebrate its first anniversary by a grand concert and entertainment at Evans Hall, February 1, 1894.

Prof. Oscar Mueller, who has in the past year been in charge of the jewelry department (in connection with his regular duties) of Ralston's drug store, has gone into the watch repairing business.

Wm. E. McJohnston moved his stock to Terre Haute, Ind., where he will locate. The store formerly occupied by Wm. E. McJohnston has been reopened by Barney Blackburn, who has refitted it in

modern style. Chas. Liech & Co., wholesale druggists of this city, furnished the glassware, drugs, etc.

Christ Butch, an Evansville boy, and a late graduate of St. Louis College of Pharmacy, who recently married at St. Louis, Mo., spent the holidays with his parents in this city. He contemplates locating here in the near future.

President George W. Haynie expects the E. P. A. to see that the members of the Indiana Pharmaceutical Association are well cared for when that body meets here in May and has appointed committees on finance, railroads, entertainment, hall, exhibits, reception, programme, hotels and queries to attend to their comfort. The committees have already met to arrange the details of the affair.

INDIANAPOLIS.

Indianapolis, January 25.—Four men entered the drug store owned by H. C. Brown, at the corner of Tennessee and Seventh streets, about 6:30 o'clock on the night of the 13th inst., and as the clerk advanced to wait on them each pulled a revolver and pointed straight at his head, ordering "hands up." One advanced to the till, took out \$6 and several dollars' worth of stamps, and then all backed out the door. They have not been captured.

A leading lawyer of this city says an expert is only one who does know absolutely what he professes to know, and applies his definition particularly to chemists. He instances a case where samples of milk fresh from one cow were put in four clean bottles and passed to an analytical chemist here, who, after analysis, reported the milk in one of the bottles to be pure; in the second bottle, to contain 31 per cent of water; in the third, 23 per cent of water; and in the fourth, 14 per cent of water, and a marked difference in the specific gravity of the milk in the different bottles.

Postoffice Inspector Fletcher, on the 19th inst., arrested at Terre Haute, Ind., George E. Bennet, a druggist, on a charge of using the mails to defraud persons who answered his advertisement for postage stamps. He offered to buy stamps of any denomination, and asked to have them sent to him for his approval. He used several names in advertising, and is charged with forging the name of a well-known citizen signed to a recommendation. His victims complained to the post-office authorities that they never heard from him again after sending their stamps.

J. W. Hornaday succeeds Hornaday & Matthews at Mooresville.

Henry D. Ridgely, 100 E. Market street, has disposed of his business to the Navin Bros.

M. A. Stewart, of Wabash, has retired in favor of his former manager, Charles D. Bradley.

The Marion County coroner's bill for '93 amounts to nearly \$12,000, including witness fees and charges for post mortem examinations.

Herbert G. Ashbrook, one of the office force at the Stewart House, has been away from his desk two weeks on account of the gripe.

Ridgeville had a scarlatina epidemic from the 3d to the 8th inst. Twenty-three cases developed, but wholesale disinfecting and good quarantine broke up the plague and all's well.

The wife of Henry D. Porterfield, one of Ward Bros.' traveling salesmen, died at her home in this city on the 20th inst. of consumption. She leaves three children.

Wholesalers say that 1894 has so far proved very satisfactory. Retailers, they say, continue to squeal a little, but succeed, nevertheless, in keeping their accounts square.

Charles Erhardt, at one time a clerk at Pantzer's, has braved the exigencies of exploration and has opened a drug store in the new addition in the extreme northwest section of the city, beyond Fall Creek.

The superintendent of the (free) city dispensary reports that during '93 there were 7,103 persons vaccinated at the institution at a cost of \$46.50, and that the number of prescriptions filled during the year was 18,555.

Some months ago the South Bend Tribune stated that a certain citizen of that town had been poisoned by a lotion used upon him by a barber of the town. A libel suit for \$5,000 followed, which has just been decided in favor of the defendant.

One of the Crawfordsville firemen and his family ate headcheese on the 18th, purchased in open market. They were taken sick and the doctor says from arsenical poisoning. Since then headcheese has been a "drug" on the Crawfordsville market.

Dr. Eisenbeis' bill of \$1,200 for five (stomach) analyses in the Koersters case has been rejected by the County Commissioners, who will not say how much, if anything, they think they ought to pay. The board has allowed other chemists \$300 for a single qualitative analysis.

C. R. MacLennan, the old-time Madison druggist, has sold to Charles E. Heberhart, who returned to Indiana from St. Paul, Minnesota, to improve his wife's health. The change of climate, however, did not prevent a fatal ending to his life partner's sickness.

Druggists are not interested in the rivalry of cigarette firms. One of the leaders has the name of the brand in a huge electric sign of 250 lights at the intersection of our two most prominent streets. Opposite, on a similar high plane, the rival has during the past week been operating the World's Fair search lights and sending their rays miles in the sky to scare the uninformed or superstitious "natives" into the belief that the world is about to end. In the meantime the newspapers have not been overlooked, and the sales of the little smokes must have been refreshingly increased.

The automatic chocolate and chewing gum machine in front of Green's drug store, Elwood, recently failed to respond when the penny was dropped in, and the proprietor felt that it was on account of there being a houseful of pennies already there, leaving the last one not enough room in which to get in its work. A post mortem was instituted, and Mr. Green has not yet recovered from the sight that met him when his bowels were exposed. Buttons, little and big, of every color and from every article of wearing apparel known were there, also keys and rings and bits of gravel and stone, small nails and pieces of wire and chunks of buckshot lead galore. He has, however, philosophically concluded that one oughtn't to look for too many pennies these hard times.

TWIN CITIES.

St. Paul, January 25. The retail druggists of St. Paul and Minneapolis have no particular boast to make of improved conditions in the past month or so, but are progressive enough to keep an eye on the changes that are constantly being made in the status of the corner drug store. They realize that they have to keep an eye on the physicians as well as the department stores and at the same time keep both eyes on the general public. The experience in going through the recent holiday season has shown that it is not only the stringent times that affect the trade of the drug store in toilet supplies and novelties. The department stores and even those that are supposed to be more restricted in their lines of trade have made such heavy inroads into the legitimate trade of the drug store that the sales of perfumes, soaps, toilet articles, as well as medicinal preparations, have had a heavy falling off in the corner drug store.

With one eye on the physicians the pharmacist has seen that there is a growing disposition on the part of the allopathic as well as the homeopathic physician to dispense medicines directly to the patients without the medium of the local apothecary. It is seen that the medical colleges impress upon the student the benefits as well as the profits to be attained by the physician dispensing as far as possible with the neighborhood drug store. Trisulphate tablets are being commonly used. The agents of the houses that manufacture tablets are cultivating the acquaintance of the physicians and selling to them direct in place of selling exclusively to the drug store. This course is pursued by the manufacturer because he wants to make sales and he knows that the jobbing houses, at least those in the Twin Cities, will not sell directly to the physician, as they have a rule to protect the retailers. Then the pharmacist finds that the old standard drugs do not cut as big a part in his prescriptions as formerly. The physician is constantly devising means to get his patients to take the medicines left and not leaving them on the shelf, throwing them out at the window or making a pretense of swallowing them, and actually spitting them out when the head of the nurse is turned.

New preparations that are as palatable as possible are being resorted to to please patients and so delude them into swallowing the nostrums and potions. This is all at the expense of the druggist. The new preparations must be on hand, or if not at hand must be sent for to the wholesale house, in order to fill prescriptions. It may be necessary to pay a dollar for a bottle of some preparation out of which to get an ingredient for a fifty cent prescription and the original package may stand on the shelf a long time before it is needed again. This does not happen at rare intervals, but often several times in a day. It is no wonder when this fact is considered that the druggist sighs at small profits and wishes for the old time physician who never used more than three simple ingredients in his prescriptions during the course of a life's practice of medicine. Neither the druggist nor the physician is willing to admit that he is at war, the one with the other, because they must work together and the fact that they are secretly resisting the

encroachments upon each other is hidden under a bushel. The physician handles his own medicines to some extent and the druggist prescribes to the prescription desk patients. Of course the usurpation of the field of the druggist by the physician and the practice of medicine by diagnosing a case on the part of the druggist are not common to a general extent, yet there is a very considerable infringement of rights and the doctors on both sides of the line are aware of the fact and disagree as to the means of solution when it is proposed to remedy the condition. Your correspondent in his talks with physicians and druggists of the Twin Cities has found that there is a jealousy between the practitioner and the dispenser of medicine and they furnished the material for the foregoing observations.

A. T. Hall, who has for a number of years conducted a modest drug store on the West Side, lately moved into new quarters in the Lowry Arcade building in the center of the business part of the city. His new pharmacy is one of the most handsome in the city. One entire side and the front are of plate glass and the interior is fitted up in the most modern and handsome manner. The building was completed a few weeks ago and some of the most prominent surgical and medical specialists in the city have taken quarters in the building. The peculiar adaptability of the building for the purposes of the doctors is the reason that it is filling up with physicians. When it became known to Mr. Hall that about twenty of the leading physicians of the city were about to make a hegra to the building, he saw the advantage to be gained by securing the corner apartments on the first floor and lost no time in changing his quarters to his present location.

The state Board of Pharmacy has made some changes relative to its examinations. It was determined to require applicants for license to be submitted to a practical test in laboratory work in addition to the written examination. This was agreed upon at the meeting held on January 16 and 17. To carry out the plan it was determined to change the place of examinations from the capitol to the pharmaceutical college of the State University so as to secure the use of the pharmaceutical laboratory there. Minnesota is said to be the second state to adopt the practical methods of testing the ability of applicants for certificates to dispense medical preparations. The pharmaceutical college of the university has been lately supplied with a large amount of additional appliances and the standard of the college is being materially advanced under the supervision of Dean Wullung.

John F. Broderick, general manager of the Ryan Drug Company, says that trade is good and has a more hopeful outlook. Business in the wholesale drug line has not been affected as much as in other lines. While there was a falling off in the volume of business in his house the past year, there is a new impetus to trade and a healthy growth is shown at the present time. The house is kept busy with a full force of men taking care of the legitimate business, without making extra efforts to push sales. Collections for the past three months have been rather better than fair and no trouble has been had with debtors. He thinks

that the retailers have been working off the old supplies and expects a heavier trade for the future.

There have been some complaints in the outskirts of Minneapolis that druggists have been selling liquors as a beverage. These complaints came from neighborhoods where saloons are prohibited. Fred Erickson was taken before the police court on January 11 charged with two violations of the law against selling liquor without a prescription. He was fined \$50 for a sale made on January 4 and the case against him for selling on the 6th was continued for thirty days.

Noyes Bros. & Cutler are satisfied with the business prospects as well as the volume being done by them at present. There has been but a light falling off in their trade as compared with wholesale houses in other lines. Their manufacturing department is running up to its full capacity, which was largely increased recently. The house has a largely increased trade in specialties, which it began to push a few months ago in the manufacturing department. No backward step is being permitted by this house, but on the contrary attention is being given to the growth of business.

S. H. Groshong has opened a new drug store at Waubay, S. D.

J. E. Pindland has opened a new pharmacy at Portland, N. D.

G. W. Silcher, of Renville, Minn., has succeeded A. W. Silcher & Co.

G. P. Jones & Co. have succeeded Jones, Riley & Co., at Raymond, S. D.

A. Sutherland, Jr., has started a new drug store at Mound City, S. D.

The J. Hildeshelm Co., of Alton, Ia., has succeeded the Lieb Drug Co.

The Missoula Drug Co. is the name of a reorganized pharmacy at Missoula.

Palmer & Green, of White, S. D., have succeeded M. L. Palmer in the retail drug line.

E. Horseman has purchased the drug store of J. D. Taylor at Church's Ferry, N. D.

Moore & Co., of Big Timber, Mont., have opened a branch drug store at Stillwater, Mont.

L. M. Kaplam, of Adrian, Minn., has become proprietor of the Kaplam Bros. pharmacy.

C. F. Little has started a new drug store with a new stock of goods at Lewiston, Mont.

Nelson & Johnson, of Granite Falls, Minn., have opened a branch drug store at Echo, Minn.

E. D. Irvine has purchased a new stock of goods and opened a new drug store at Emerald, N. D.

E. E. Gould, of White Sulphur Springs, Mont., has purchased the drug store of Hartfield & Rand.

A. F. Backhaus has succeeded Bright & Schmidt in the pharmacy at 129 Nicollet avenue, Minneapolis.

A. S. Putnam & Co., of Manistiquet, Mich., is the name of a firm succeeding Thompson & Putnam.

Cutler & Rand, of Park Rapids, Minn., have become the owners of the P. D. Winship & Co. drug store.

J. J. Rems has added a new drug store to the town of New Prague, Minn., and has a new stock of goods.

Gulnter & Dow, of Sioux Falls, S. D., have bought one of the drug stores of W. H. Nelson, an insolvent, who recently made an assignment.

Robertson & Cowan is a new firm at Cottonwood, Minn., that succeeds J. B. Robertson.

S. J. Horn, of Minneapolis, has purchased the drug store of Henry Jones at 2835 Chicago avenue.

The Ley Drug Co., of Lime Springs, Ia., is the name of the new firm which the Searles & Ley drug store.

F. M. Billings & Co. have purchased a new stock of drugs, etc., and started a new store at Langford, S. D.

Parchen & D'Acheul Drug Co. is the name of a new firm at Helena, Mont., that succeeded H. M. Pachen & Co.

J. M. Kistler has succeeded the firm of Horn & Kistler in the pharmacy at Humboldt street and Sixth avenue south, Minneapolis.

William Mathlen, of Verdon, S. D., has become the sole proprietor of the drug store formerly run in the name of Mathien & Fletner.

G. W. Petrie, of Fairmont, Minn., has become the proprietor of the pharmacy owned by Ramsdale & Holcomb, who went into bankruptcy.

KANSAS CITY.

Kansas City, Jan. 25.—The retail druggists have, during the past month, been in conflict with a fee grabbing prosecuting attorney and his allies, a lot of deputy constables. The law prohibits druggists, not holding regular dram-shop licenses, from selling liquors in less than three gallon quantities, except upon affidavit that the liquor is to be used for scientific purposes, or unless a physician's prescription is presented. The druggists have generally ignored the law and have been in the habit of selling in small quantities to regular customers without demanding the affidavits. The prosecutor furnished a horde of disreputable constables with money and ordered them to buy "evidence" at the drug stores. Then he issued a hundred warrants for the arrests of the druggists. That it was only a scheme to make costs and fees for the officers was soon demonstrated. A dozen of those first arrested pleaded guilty and were told that there were three cases against each; that the fines would amount to \$3 and that the costs were \$46. A few paid. The newspapers exposed the scheme as little better than blackmail and the Retail Druggists' Association retained lawyers to fight the cases. The constables ceased to serve the warrants and bestirred themselves to get evidence to bring convictions before a jury, on the cases already begun. A clerk for J. T. Young was tried and acquitted and the prosecutor was slow to try another case before a justice of the peace, but took the matter before the grand jury, which will not make a final report for some time.

That the prosecutor was not actuated by an honest motive was demonstrated by the fact that the minimum fine for a violation of the law was \$40, but that he might make more fees he altered the charge to a general misdemeanor, that a fine of \$1 might be made in more than one case, and the costs be tripled by dividing the amount of an ordinary fine, so that it would largely go as "costs." The justice and constables had already become notorious by reason of "fake" cases brought solely for the costs.

There are a very few druggists in this city, not more than half a dozen, who

have made their stores little better than fashionable bar rooms, even going so far as to sell beer from their soda fountains, and whisky by the drink, but the constables, for some reason, failed to arrest them, taking only the legitimate druggists. The agitation has undoubtedly wrought some good, in that it has put a stop to indiscriminate sales of liquor, but the druggists are unanimous in agreeing to continue to sell, for family or medicinal use, until the Supreme Court shall pass on the law. Had the dram-shop druggists, who disgrace the profession, been the only ones arrested, there never would have been any complaint.

The Missouri State Board of Health met in annual session in Jefferson City a few days ago and elected the following officers: President, Dr. F. J. Lutz, of St. Louis; Vice-President, Dr. A. W. McAlester, of Columbia; Secretary, Dr. W. P. King, of Kansas City. But little of general interest was done at the meeting.

The City Council of Emporia, Kas., has passed an ordinance placing so high a license tax on the sale of cigarettes that the sale of tobacco in that form will be effectually stopped. The ordinance also provides that no children under the age of 16 years shall be sold cigarettes. A recent investigation made by a number of parents showed that not only a majority of the boys, but also a large number of the girls were addicted to the pernicious habit.

The Gem Pharmacy has been opened at the corner of Sixteenth and Wyoming streets.

T. L. Harrison, traveling for the Graham Soap Company, of Chicago, was here recently.

Mathew Miller is now making many new friends as clerk at the Woodland Pharmacy.

A representative of Johnson & Johnson, New York, was in Kansas City a few days ago.

Robert J. Holmes has given a chattel mortgage for \$3,142 on his new soda fountain to Charles Lippincott & Co.

The Alumni Association of the Kansas City College of Pharmacy will tender a banquet to the graduating class some time next month.

Dr. Liesch, formerly a druggist at Lee's Summit, near Kansas City, has moved his store to Lexington, Mo. He made a visit to Kansas City a few days ago.

Eli Tobias, formerly a clerk for O. W. Krueger, has forsaken his old profession for a new one, and has gone on the road with the Rose Watson theatrical company.

The young daughter of W. J. Bonesteel, formerly a druggist at Grand Island, Neb., has disappeared from her home in Kansas City, and it is thought she has drowned herself.

Mr. Campbell, formerly druggist for the dispensary of the Board of Health, is now a clerk in H. S. McDonald's drug store at the corner of Independence and Prospect avenues.

A popular Kansas City barber shop has introduced the "vaseline shave," as a luxury for a man with a tender face. Vaseline, nicely perfumed, is used as a substitute for soap lather.

T. L. Tucker, for twenty years a pharmacist in Elgin, Ill., has come to Kansas City and is now associated with O. W. Krueger, druggist, at the corner of Fifth street and Broadway.

Frank Bishop has discovered a rich deposit of ochre on his farm near the hamlet of Bethel, in Wyandotte County, six miles west of Kansas City, Kas. The mineral is being tested to ascertain its commercial value.

W. J. Brouse, O. Q. Clafin, H. S. Cooke and C. G. Pinckard, druggists in Kansas City Kas., South Side, were arrested for violating the prohibitory law. They fought the case in the police court and were acquitted.

F. W. McKay, formerly a drug broker in the Baird building, and Henry Tuttle, formerly manager of Clara Farabee's drug store, have formed a partnership and have opened a new drug store at the corner of Fifth and Harrison streets.

W. C. Lemon's drug store at the corner of Independence and Elmwood avenues, just outside the city limits, was destroyed by fire a few nights past. The fire started in the basement, probably from spontaneous combustion. Loss, about \$1,500; partially insured.

Joseph R. Erinkley has bought the stock of Dr. E. C. Wilson's drug store at the corner of Fifteenth and Locust streets, and has moved it to the corner of Eighteenth and Vine streets, where he has established a branch of his old Vine street drug store.

S. S. Winn, assignee of the Marshall Chemical Manufacturing Company, filed his report in Judge Slover's court January 29. It shows receipts during term amounting to \$3,463.07, and disbursements amounting to \$440.04. The total receipts up to date are \$7,145.25 and the total disbursements \$1,650.54.

J. W. Lynch, formerly a druggist at Blue Springs, was arrested in this city on a charge of being a fugitive from justice. Lynch escaped from the officers at Blue Springs several weeks ago, after having been fined \$100 by Justice Nichols for selling liquor to minors. Two other charges of a similar nature are still pending against him.

Harry Morrison, a graduate of the Kansas City College of Pharmacy, who has lately been connected with a drug store at Scotsville, Kas., has opened a drug store at the corner of Fourteenth and Campbell streets, in the building lately vacated by H. H. Gregory, who moved his drug store to the corner of Ninth and Wyoming streets.

James W. Hardacre, at one time proprietor of a drug store at the corner of Tenth street and Forest avenue, and lately with the Evans-Gallagher Wholesale Drug Company, has opened a new store on the southwest boulevard, near Pennsylvania avenue, in the building formerly occupied by Dr. Whittinger, who has moved his store to East Eighteenth street.

A. F. Price, who carried on the retail drug business at 1056 Union avenue, under the name of Frank Price, has made an assignment to Upton Eby for the benefit of creditors. According to Mr. Price the value of assets is \$10,000. The liabilities are not stated in the deed of assignment, but are said to be less than the assets.

J. V. Ellard, receiver for the Palmer Manufacturing Company, at the northeast corner of Twelfth street and Broadway, has filed an inventory and appraisal of the company's assets. The furniture, fixtures and merchandise are scheduled at \$9,827.71. The merchandise is listed at \$3,507, and the fixtures at \$4,082.

The stock in the store at Enid, Okla., is appraised at \$900. The appraisers were Frank A. Faxon, P. D. French and W. D. Charde.

Joseph Irven, lately from Honolulu, and who pretends to be an agent of the provisional government of the Hawaiian Islands, spent three weeks in Kansas City and succeeded in beating merchants out of many hundreds of dollars' worth of goods by means of a smooth tongue and a worthless draft. Among others he defrauded Druggist Graham, of Twelfth and Main streets, of \$35. He is an Austrian by birth, is of small stature, and wears a short beard.

The Marshall Medicine Company has filed articles of incorporation. The object is to manufacture pharmaceutical preparations, druggists' and grocers' specialties and toilet articles. The capital stock is \$10,000, all of which has been paid in full. It is divided into 100 shares, of which Elizabeth Leach owns ninety-eight shares and George W. and Margaret J. Marshall one share each. The manufacturing will be carried on at 417 East Eighteenth street.

Miss Minnie Huston, a young girl residing with her parents on Second street, between Lynn and Church, in St. Joseph, Mo., came near meeting her death by drinking a freckle lotion. Miss Huston had recently purchased a bottle of medicine guaranteed to remove all the freckles from her face. She had used only a small portion of it in the manner intended when she became dependent on account of illness. She decided that she would take her life, and, accordingly, took a very liberal internal application of the freckle lotion. A physician was called, and by using the stomach pump succeeded in saving her life. The medicine contained corrosive sublimate.

THE SOUTHWEST.

A fire at Chillicothe, Mo., destroyed the drug store adjoining the Henry house, a few days ago.

Putnam Brothers, druggists of Atchison, Kas., have failed with \$3,000 liabilities and \$1,700 assets.

The commissioners of Leavenworth County, Kas., have appointed Ed C. Fritsche county druggist.

Burglars broke into Dr. Van Cleave's drug store at Nowata, I. T., a few nights ago and stole quite a large sum of money.

J. E. H. Raiffley, druggist at Hillsboro, Tex., has executed a deed of trust for the benefit of creditors. Total liabilities, \$137,72; assets unknown.

The Mound City Paint and Color Company, of St. Louis, has elected Norris B. Gregg, W. H. Gregg, Jr., and E. H. Dyer directors for the new year.

Burglars became bold in Richland, Mo., recently and broke into most of the stores in the town. Among those which suffered by the raid was Vincent's drug store.

The Crescent Color Company, of St. Louis, has elected W. S. Millen, president; William M. Scudder, vice-president; J. A. Sublette, secretary, and E. J. Walker, treasurer.

The drug store of Reeks & Calbroth, at Powersville, a small town in Putnam County, Missouri, was destroyed by fire January 15. The stock was valued at \$3,000 and but little of it was saved. It was insured for \$1,200.

Fire swept over Sater, Mo., recently, and among the buildings destroyed was E. O. Allen's drug store. A little of the stock was saved. Allen's loss is estimated at \$3,000, with a \$2,300 insurance.

The drug store of Sewell Bros., at Everest, Kas., was totally destroyed by fire recently, together with several small buildings, to which the fire spread. The loss is estimated at \$10,000, with but little insurance.

The Brown Medicine Company, of Leavenworth, Kas., has been incorporated with a capital stock of \$50,000. The directors are R. J. Brown, George A. Eddy and E. Gregory, of Leavenworth, and W. A. Doolittle and Harmon Tarr, of Sabeth, Kas.

Fire has destroyed the drug store of J. M. P. Kasset at Waco, Tex., making a loss of \$3,500, on which there was \$1,000 insurance. G. B. Strale, who was asleep on the second floor of the building when the fire broke out, jumped to the ground and was terribly injured.

An explosion started a fire in the Post Office Block at Uniontown, Mo., January 15. The branch store of the Monroe Drug Company was burned out. The loss is estimated at \$4,500, insurance \$3,000. A small part of the stock and fixtures was saved.

A disastrous fire broke out in Paragould, Ark., January 12, and destroyed, among others, the drug store of J. M. Davis & Sons and the drug store of N. Donaldson. The loss on J. M. Davis & Sons' stock is estimated at \$4,000, and on N. Donaldson's about \$3,000.

F. J. G. Zethraes, a druggist at Paris, Tex., conveyed his stock of goods and fixtures under a deed of trust to Charles F. Thebo, January 15, for the protection of his creditors. His total indebtedness is about \$3,500. The claims against him are all small, not exceeding \$100 each, except the following: W. C. Chisum, \$1,250; Paris Exchange Bank, \$850; Dudley & Moore, \$450.

Arthur A. Winter, a traveling salesman from Muscatine, Ia., was arrested on the eve of his marriage to a Muscatine belle, and the nuptials postponed at the demand of J. T. Dougherty, a druggist, who has secured a judgment of \$750 against the prospective bridegroom. The judgment is the result of a suit for false arrest growing out of an old-time dispute between the men, who were formerly business partners.

M. R. Bruckner, proprietor of the Lion Drug Store, at Paris, Tex., has filed two deeds of trust, the first covering his stock of drugs, liquors, fixtures and all personal belongings in the Clements building, on the north side of the square, and the lease on the same; twenty shares of stock of the value of \$100 each in the Paris Gas and Electric Company, and 250 shares of stock in the Texas Sulphur Mining Company. The other was on a lot 270x394 feet, in Paris. E. B. Baker was named as trustee in both instruments.

In the matter of the application of the Collector and Surveyor of Customs at St. Louis for a review of the decision of the Board of United States General Appraisers as to the rate and amount of duty on certain merchandise imported by the Mallinckrodt Chemical Company, those officials have recently represented to Judge Phillips their wish to make further testimony, and they asked that for that purpose the cause be referred to Wilbur F. Lunt, one of the Board of

United States appraisers, to take depositions as to the facts therein. Judge Phillips granted an order to that effect. At the hearing the government will first offer its testimony and then the Mallinckrodt Chemical Company may introduce testimony in rebuttal. The referee is to report within sixty days. The testimony is to be taken at St. Louis and New York, and wherever else the parties may agree.

Thomas N. Van Natta, of the wholesale drug firm of Van Natta, Lynds & Co., of St. Joseph, Mo., brought suit against Harriman & Co. and Newcomb & Co., of New York, owners of the late People's Street Railway, Electric Light and Power Company, of this city. This company was until recently in the hands of a receiver and is now known as the St. Joseph Light and Traction Company. Some time ago Mr. Van Natta recovered \$7,000 for damages done by one of the defendants' cars to his little boy. When the old company dissolved no provision was made for the payment of his claim and the petition charges James T. Gardner, of New York, John H. Owens, receiver, of this city, and Arlick & Brown, attorneys, of this city, with fraud and collusion. He asks to have set aside the recent proceedings of court whereby these parties were granted compensation, claiming that they retained only a portion of the amount allowed them and charging that they returned the balance to the company for the purpose of defrauding his claim and judgment. An interesting law suit is expected.

Fond du Lac, Wis., druggists have formed an association.

A Rockland, Me., physician 98 years of age has gone into the proprietary medicine business, putting out a cough cure.

Druggists of Oakland, Cal., have gone to cutting prices again to meet the cut in San Francisco.

A new fad among society girls is what is termed the vaccine limp. They would not limp if they were vaccinated on the arm.

The Maryland Pharmaceutical Association will make another decided appeal to the Legislature to pass a pharmacy act for that state.

The Board of Selectmen, Hartford, Ct., want the druggists to establish a uniform price for medicines which are used for treating the poor under the care of the town physician.

The death of Mr. George H. Herrick, which occurred January 10th, will not affect the business of the Herrick Drug Co., Owatonna, Minn., of which he was senior member. The firm announce that the business will go right on, and will, for the present at least, be conducted by Wm. Gansewitz, of Little Falls, Minn.

The Mercer Chemical Co., Omaha, Neb., have succeeded the Mercer-Whitmore Co., Dr. R. T. Whitmore being no longer connected with the concern. On January 18 the new company amended their articles of incorporation, changing the name as above, and now announce to the trade that in future their business will be conducted under the new style.

PITTSBURGH.

Pittsburg, January 24.—The Pittsburg College of Pharmacy deserves credit for the work it is accomplishing. Its supporters are not creating any furious commotion either in educational or business circles hereabouts, but the results are quietly effective. At present the college occupies several rooms in a large block at No. 86 Water street, facing the Monongahela river, but the trustees hope to secure, in the near future, more commodious quarters. They even entertain hopes of putting up a building to be devoted entirely to pharmacy. A. C. Robertson is president and J. A. Koch, Ph. D., dean. Prof. F. T. Aschman, Ph. D., has charge of the departments of organic and inorganic chemistry. Adolph Koenig, M. D., lectures on materia medica. Gustave Guttenberg, A. B., a well-known Pittsburg scientist, teaches microscopy. John A. Shafer, A. H. Poth and J. C. Campbell conduct quizzes and assist the instructors. This year's classes include 30 seniors and 50 juniors. The present session marks the sixteenth annual year for the college. This year the final examinations will be held March 5, 6 and 7.

The Pittsburg Paint and Drug Club, member of the National Association, held its semi-annual banquet Friday evening, January 19, at the Hotel Duquesne. Eighteen guests were present. A fine dinner was served.

The Masonic friends of Dr. Abner S. Bender, of the L. H. Harris Drug Company, gave him a banquet at the Seventh Avenue Hotel a short time ago. It was a royal occasion and thoroughly enjoyed by the hosts and their honored guest.

Burglars broke into the drug store of Wilson & Work, at New Florence, Pa., a short time ago, making twice within a year that the store has been entered. This time the unknown marauders stole about \$15 in cash and a lot of cutlery, tobacco and cigars.

On January 4, James Monroe, a drug clerk of Wellsville, O., committed suicide by taking morphine. The cause is thought to have been despondency at being out of work. He came to this country from Scotland in 1889 and at one time was in the employ of Dr. Dickson, of Penn avenue, this city.

DENVER, COL.

F. J. Lord, who recently purchased the store belonging to T. A. Axtell, has sold it to Maybury & Perry.

L. A. Schoppe, who was wounded by burglars in his store some time ago, has entirely recovered, with only a slight scar to recall his midnight visitor.

The Metropolitan Pharmacy, formerly owned by Dr. Rader, of Durango, has been purchased by Jas. J. Moses, who has for some months past been managing that place.

Mr. Haswell's Fifteenth street store has lately been purchased by Mr. Patterson. This was the original Haswell store. Mr. H. is as yet the proprietor of two, one of which he opened very recently.

Business in and around Denver is increasing with great rapidity, considering the great depression it has gone through, and traveling salesmen, having been through the state, say that business greatly exceeded their expectations. Among business changes are the following:

BOARDS OF PHARMACY.

Colorado Board of Pharmacy examined 19 candidates January 8.

Ohio Board of Pharmacy, on January 9, at Cincinnati, examined 70 applicants for pharmacists' licenses, and 46 for assistants'. Next meeting in April, at Columbus.

South Dakota Board of Pharmacy met at Parker, January 10. The report sent in by the secretary is illegible, hence the result of the examination cannot be stated. Next meeting at Huron, April 4.

The Georgia State Board of Pharmacy will meet at Atlanta February 26. The standard has been raised to 65 per cent necessary to pass. Intending applicants should address Secretary H. R. Slack, La Grange.

Connecticut Board of Pharmacy has granted licenses to George J. Schirch, Windsor Locks; John J. Sullivan, Stamford; R. G. Foster, West Point; Alexander C. Prinz, New Haven; Herbert L. Hayden, New Haven; John C. Colgan, New Haven; Frank L. Palmer, Stamford.

The Minnesota Board of Pharmacy has inaugurated a practical examination in addition to the written answers to questions. Hereafter examinations will take place in the laboratory of the College of Pharmacy, State University. January 16 was the date of the last one. H. P. Barclay, of Stillwater, has been reappointed on the board.

Missouri Board of Pharmacy, at its January meeting, examined 57 candidates and granted certificates to 23, viz.: Frank M. Buch, W. A. Clark, Jas. A. Flippen, Chas. Hahn, N. P. Jensen, H. E. Klosterman, E. O. Kunitz, F. J. Mobbs, Arthur C. Newberger, Jos. B. Over, Arthur W. Paul, G. H. Rathel and O. B. Strub, of St. Louis; Ed Bishop, Point Pleasant; I. L. Grady, Slater; F. H. Roberts, Longwood; H. Rosmer, St. Charles; George A. Sailing, New London; B. B. Tatman, Unionville; A. W. Vesperling, Cape Girardeau; J. Zahorsky, Steelville; R. E. Barnes, of Illinois, and Chas. V. Machew, of Kentucky.

Illinois Board of Pharmacy met at Springfield January 8, and elected officers as follows: President, L. C. Hogan, Chicago; vice-president, A. H. Green, Bloomington; treasurer, L. N. Coffey, Cairo; secretary, Frank Fleury, Springfield. The following day an examination was held, the successful ones being: Charles A. Dresbach, Charles W. Armstrong, Decatur; E. H. Thomas, Argentine, and E. E. Kennedy, Bethany. The following passed as assistant pharmacists: S. Suter, Bloomington; W. G. Williams, Quincy; E. M. Bonnell, Dixon, and H. H. Pinney, Wilmington. The receipts for the year 1937 were \$7,876 and the expenditures were \$7,896.62.

Wisconsin Board of Pharmacy met at Milwaukee, January 17. Of the thirty-nine young men who took the examination, eight received licentiate or first grade certificates, as follows: C. H. Dickenson, Sharon; Frank W. Collier, La Crosse; George S. Roberts, Fox Lake; C. J. Biberlick, D. F. Harbidge, C. O. Zimmer-

man, A. R. Wintzel, Frank Braun, Milwaukee. Fifteen assistants' certificates were awarded, as follows: G. E. Seyforth, J. I. Fairchild, E. D. Regan, F. A. D. De Hardy, C. J. Kaiser, B. A. Weber, Louis Lau, Milwaukee; H. F. Morris, Waukesha; Charles A. Griffman, Manitowoc; F. A. Root, Milton; C. C. Johnson, Wau-pun; J. M. Sattler, Marion; R. E. Chaffee, Janesville; J. W. Walthers, Stoughton; George W. Horn, Mineral Point. Sixteen were rejected. Next meeting at Green Bay, March 21.

Michigan Board of Pharmacy examined a class of 55 at Saginaw, January 9. Forty-four were successful:

Registered Pharmacists—R. S. Armstrong, Chelsea; Geo. W. Beckett, Manistique; F. W. Hamilton, J. M. Freeman, St. Charles; E. T. Jones, Chatham, Ont.; John Murray, Merrill; G. H. McGellivay, Muir; A. A. Schram, Crossville; Geo. Sharar, Alma; C. E. Smith, Saginaw; T. Thomas, Fowlerville; L. P. Vogel, Chelsea; G. T. Kast, E. J. Eastman, O. A. Nichols and O. R. Hintermeyer, Detroit.

Registered Assistant Pharmacists—C. E. Bradshaw, Yale; G. C. Drake, Imlay City; W. H. Eaton, Detroit; G. G. Gardner, North Star; Robert Goodfellow, Clay; Ralph Henderson, Millington; Ella Ernst, Port Huron; J. E. Knapp, G. N. Gankel, J. E. Lanckner, J. F. Martin, W. F. Lount, F. W. Wilhelm, Bay City; L. O. Loveland, Charlotte; H. A. Main, Tekonsha; D. W. Mitchell, Harrisville; E. L. Moore, Melvin; James McGregor, Ann Arbor; G. E. Orth, Ewart; B. Pemberton, Memphis; F. D. Simpson, Flint; B. A. Smith, Portland; L. D. Bates, Burnside; J. W. Browne, Augusta; O. G. Milliken, Silverwood; E. Lauckner, F. Wiese and B. Reimold, Saginaw. Next meeting at Grand Rapids, March 6 and 7.

PHARMACEUTICAL ASSOCIATIONS.

The Norfolk & Portsmouth (Va.) Pharmaceutical Society has elected Dr. A. B. Helstand president.

The Hartford (Ct.) Druggists' Association has elected P. W. Newton, president; C. H. Bell, secretary, and L. H. Goodwin, treasurer.

Monros County (N. Y.) Pharmaceutical Society has been organized with these officers: President, Alvin H. Dewey; vice-president, Louis Wyeth; secretary, A. R. Mandeville; treasurer, J. Jay C. Curtis; executive committee, Messrs. Hewitt, Hyde, Bryan, Nagel, Wyeth and Dewey.

The Milwaukee drug clerks have perfected a temporary organization by the election of officers as follows: President, Arthur C. Block; secretary, Alfred W. Luebke. Committees on membership were appointed, for the East Side, M. Trayser, C. Rogers; West Side, C. A. Henni, A. Melnecke; South Side, H. J. Webber, William Wasweyer. Messrs. C. A. Henni, Max Trayser, W. Wasweyer, Charles Zimmerman and H. J. Webber were instructed to report a constitution and by-laws at the next meeting in Liedertafel hall, January 26. The objects of the association are the establishment and equipment of rooms in which to listen to lectures and papers, attend quizzes, conduct experiments, and pass an occasional social evening with musical and other entertainment.

CORRESPONDENCE.

We accept no responsibility for the views and utterances of our correspondents. Contributions must carry full name and address of the writers, which, however, will not be published, if so requested. Copy should reach us ten days in advance of date of issue.

CANADIAN PHARMACY NOT WHAT IT SHOULD BE.

To the Editor,

I should like to see a time clause of apprenticeship become a more general thing. That is, so an apprentice could not come into one's store to stay a specific time upon agreement, and when good progress had been made, not finish out his time, because some one would pay higher wages for the skill, now useful and which he did not impart. This is a notorious condition to-day, and prevents in some measure turning out well grounded men. You can readily see why. It is as common in Canada as here. As a partial antidote, I would suggest rigid investigation as to causes why such time was not completed, and advise no brother pharmacist to engage the applicant for a new position unless more satisfactory reasons are assigned than that "I could not get along with Mr. So-and-so. He was hard to please," etc.

Doubtless some American pharmacists will consider it their duty to reply to the strictures on the manner most drug stores are conducted here, which were made by Mr. N. H. Martin, of England, and published in your last issue. With the full conviction that he can and will be answered by those many times better qualified than myself to do so, I should like to be allowed to defend myself as a pharmacist who, while not ignoring some of the advantages of college training, is only conducting a pharmacy on the authority of a State Board certificate of examination qualification.

To begin, I was born in Canada and had three years' training in a drug store there, in a town of 2,000 inhabitants. My preceptor (as they are called there) was a graduate of what is considered the best college of pharmacy there, or even on this continent. Many were his boasts of this fact, and right here let me ask why Mr. Martin, who uses the term "American," did not see fit to include Canada in his criticisms? While it is not England, at the same time it is supposed to be modeled in most respects more after that country than this, and in common with the English, the Canadians seldom let slip an opportunity to attack all kinds of educational institutions and methods and results of the educational system in vogue in the United States.

They will tell you fast enough that the standards of pharmacy (and medicine) are so low here that it is no uncommon thing for diplomats for either profession to be bought outright. (These statements are not based on hearsay.)

To resume, if he (Mr. Martin) had seen fit to extend his vision to that delectable field of pharmacy, I think from what I am about to subjoin he would have found enough awry to include Canadian pharmaceutical methods as just subjects for his gentle correction.

Mr. Martin makes much ado out of the heterogeneous lines of goods to be found in the average American pharmacy.

Well, in this Canada drug store the stock consisted of drugs, paints and oils, kerosene, wall paper, cigars, soda water,

candy, musical instruments, toys, albums, optical goods, school books, books on religion, garden and flower seeds, etc., etc.

And this in a town of 2,000 inhabitants and having five (most learned) doctors!

Now, as to results of this most lofty college training in the field of true pharmacy:

There never was an ounce of distilled water in that store while I was there. I have seen many a solution of silver nitrate made there, using pump water as the solvent. Nice, was it not? There never was prepared an ounce of mucilage of acacia the gum, not in granulated form, was hastily and crudely hammered up in a mortar when the true mucilage was called for. Rose water was always made by addition of a quantity (cost being the determining factor as to quality) of so-called triple extract rose to water from the pump.

There never was a percolator on the premises, tincture of opium and the camphorated tincture of opium being invariably bought from the jobber; and all but the simplest tinctures prepared by diluting the corresponding fluid extracts. It was the constant practice in this high-class Anglo-Canadian pharmacy (taking its rank, perhaps, from the Anglo idea) to mix the fluid extract with cherry with syrup made from brown sugar when the splendid preparation of the U. S. P. was called for and intended, etc., etc.

Now, these are facts. That the proprietor of this store could probably tell a serrated leaf from one which was not serrated, and translate a little "pachyderm Latin" prescription phrasing better than many State Board Pharmacy incompetents, I am willing to allow.

But did the public get better service there in the respects enumerated than it gets here?

I think not; and thinking thus, I respectfully submit the question to your honest consideration.

Yours very truly,

A State Board of Pharmacy Man.
Moreland, Ill., January 19.

WINDOW DRESSING—A REPLY.

To the Editor,

Little did I expect, when I sent you a detailed description of my show window, that I would so soon have to rush myself into your valuable columns, but the uncalled for article, or I should say, attack, from the eloquent pen of my brother druggist, J. Wand, of Oklahoma City, OK, forces me to reply. In the first place I should like to know if it is criminal for two men to accidentally conceive or concoct the same plans or to fall upon the same ideas; brother Wand says he has had the same display for the last three years except he has had a chicken yard in lieu of an aquarium or fish pond. Dear reader, is there no difference between a chicken yard and a fish pond with water running from high rocky cliffs, reaching a water wheel below, which runs a millature mill? Even if Mr. Wand had had the same display, identically, as I described in the December 1st issue of the Era, what of it? I said nowhere that there never existed any such display as mine, neither in heaven above nor on earth below. I only gave a description of my window at the solicitation of the Era, and gave it exactly as it was, and closed by saying that I hoped the description would be an idea entirely new to some

druggist, of course this part of my remarks was not directed to Mr. Wand, as he had the idea three long and weary years previous to the writing of my article; he had not succeeded, however, in this long time in having a drug journal to ask from him a "write up" of his display; Brother Wand, if the shoe does not fit, don't wear it." Mr. Wand could have written his little article in very much plainer and much more brotherly language had he made the effort, and not have transformed himself into the traditional or biblical animal which we are told was ridden by Baham of old. I will state for the edification of friend Wand that my window was gotten up by myself and only myself, and as far as I knew was the only one of the kind. I received hints from no one in regard to the matter, not even Mr. Wand himself, strange as it may seem, and I was informed by hundreds, yea, thousands, that they had seen nothing of the kind and a great many of my window admirers were drummers who travel a few miles occasionally. It is useless for Mr. Wand to give references in regard to the truthfulness of his statements, for I firmly believe him, because he is a brother druggist, and I will believe a man implicitly he be a druggist. In conclusion I will ask my readers if they do not think Mr. Wand's letter rather too insinuating and harsh, and if there be any difference between a fish pond and a chicken yard, between fiab and fowl (foul).

Respectfully,

A. J. EMBRE, Belton, Tex.

PERCENTAGE SOLUTIONS—A CORRECTION.

To the Editor:

In your issue of January 1st, 1894, my communication on "Percentage Solutions" has been so altered as to destroy my special claim of mathematical accuracy for the formula. My rule merely formulated in words a simple process in arithmetic, and runs thus:

Multiply the weight (in grains) of a dram of water, by the number of drams of solution required, and this product by the percentage required. Divide this result by one hundred (100), less the percentage required. The quotient will be the number of grains of material to be added to the fluid, in order to make the required percentage solution in the quantity desired.

Take, for example, the following:

Sol. cocaine muriate, 6 fl. drams.

(Sol. 5%.)

Assume one dram of water to weigh 57 grains (a constant quantity). Then, according to the rule:

$$\frac{57 \times 6 \times 5}{100 - 5} = \frac{1710}{95} = 18.$$

Hence, add 18 grains of cocaine muriate to six fluid drams of water, and the desired quantity of the desired strength is made. If the solvent be any other fluid than water, the weight of a dram must be determined by weighing, as in the case of water. You failed, in printing my communication, to give the divisor correctly, that is: 100 less the percentage required. This rule is unvarying. I regret very much to have published over my signature a mathematical untruth, and I trust you will publish this as early as convenient.

Yours very truly,

JOHN F. JUDGE,
Philadelphia, Pa.

A TALK ON VANILLAS.

By Charles E. Hires.

(Continued from page 85, January 15, ERA.)

THE proper time for the Mexican vanilla bean to ripen is in January or February, but such a demand is made for the bean that for several years past the growers have begun to gather the crop in October and November, so that the harvest is over before the time it should have commenced, and this vanilla weighs one pound less to the thousand and remains red and subject to changes. Vanilla, if allowed to ripen naturally, remains black, juicy, and of a silvery hue shortly after its curing, and for many years it can be preserved unchanged, but if cut prematurely it is affected much, as any other fruit naturally is when picked two or three months before the time, and it never looks as it should when this is done. In order to impart to

the bean all the good properties of which it is susceptible it should be cut as it becomes yellow, for, if it be cut all at once, even though it be in the month of January (as was the practice some years ago), the result will be that a great portion of it will remain unripe, because as it blooms in March, April or May this same gradual change continues, everything being equal, until it ripens. There is, besides, another cause which brings about the same difference, even in the case where they blossom together, and that is the greater or less shade afforded by the trees on which the vines grow. In former times, in compliance with an order from the government, the sub-delegates, and after them the civil authorities, were instructed to see that the

unripe fruit should not be cut. When this duty fell to the lot of conscientious and active persons, abuses were in a great measure avoided, but completely satisfactory results were far from being attained on account of the scarcity of the necessary means to watch and pursue smugglers. At other times the office was applied for by indolent persons, who regarded the orders of the government with indifference, and thus the law soon fell into disrepute, and was finally abolished. The difference between the price of the vanilla picked during October and November and that picked after January is in the proportion of three to nine. Those acquainted with this fact, seeing those beans sell for the third what they know by their yearly experience could

be sold for nine because they do not want to wait two or three additional months, might think the sellers foolish, or would imagine that poverty compelled them to suffer this loss, but it is neither the one thing nor the other, because these people are clear-headed and their prosperity so general that it may be said there are no people in the world who live in greater ease than do these people of Papantla, and this is not alone due to the fertility of the soil and the good quality of the products which are obtained through cultivation, but also because in their forests important products grow wild which are the property of any one willing to gather them. The motives actuating these people in selling the vanilla before it is ripe are avarice on the one hand and rascality on the other. The first vanilla sold, has, as a rule, been stolen, and as it is cheap, though of poor quality, it is always a bargain for the buyer. The planters who have vanilla beams somewhat distant from their homes, as soon as they know of any purchase or sale, cut their own beans, fearful lest the same be stolen, as they know by experience, immediately upon the start of such traffic, complaints are heard from the unfortunates, who in a short time are deprived of the results of hard labor and care. The abnormal condition of affairs goes on, and thefts repeatedly occur even in the best guarded vanilla forests, whose owners cannot constantly oversee by day and by night, as other duties require their attention. For this reason they decide to cut and sell the vanilla bean at very low figures, rather than to suffer total loss. For no other reason is the fruit gathered and sold before it is thoroughly ripe. This unseasonable traffic, both immoral and highly prejudicial to the property interests of these cantons, should be

checked by proper legislation; in this way the crop and the quality of the goods would be much greater, and the superior and delicate flavor which justly belongs to the best Mexican vanilla bean would make it esteemed above any other aroma in the world.

In curing vanilla it is an easy matter to impair it either by an excess or lack of dryness, perfect curing is only attained when the bean is left in such a condition that it remains juicy and retains its greatest possible weight, a consummation which the expert should constantly aim at. If the vanilla is cut when ripe, success will be easy, but when cut prematurely, as has been the case during many years, art has to replace nature as far as possible, which can be done only through labor and substantial knowledge of the subject so that some idea may be formed of the delicate care needed for this operation. Suffice it to say that even the best known experts sometimes permit the vanilla to dry too much, or else the greater part of it, not to say all, becomes filled with insects, either before or after the process of curling. It is only necessary to allow it to remain in the sun three or four minutes more or less than is required to bring about one or the other of these results. Great care and fine eyesight are required in the separation of the diseased from the sound, because, if only one bad bean remains undetected it will mold and endanger other bundles in a short time. The curers in Papantla excel in curling and bunching the bundles, and in the regularity and evenness with which they classify the size and quality. As a rule planters do not know how to prepare the bean, so they sell them in an unripe state to curers, who employ experts for that purpose. The beans are brought in by the natives in large and small lots

very similar to the way in which our country people bring in rags, butter and eggs to the town storekeeper. The beans are first put in a sweat box, where they are sweated about 36 hours. They are then placed on mats in the sun if the day is bright and clear, if not they are placed in a large oven to dry. This requires the utmost care and attention, else the beans are easily spoiled. After the excess of moisture is dried out, they are again sweated. This operation is repeated until they are black. They are then placed in the sun, in the middle of the day only, from 11 to 1; they are then put in racks in vanilla rooms, one above the other. While the curling is going on it is necessary to separate them with the utmost care; the discolored from the black bundles, the very small, the impoverished, those with skin woody at intervals, the one with a tough, thick and smooth skin, and also the spotted, cracked or split bean, assorting them in their respective classes. The great care to be exercised in curling vanilla can be appreciated by what I have said before; but it is not amiss to observe that however little it is over dried it is sufficient to reduce the weight almost one pound to the thousand, which would be a great loss, besides the bean that is over-dried loses some of its color and depreciates in value one or two dollars a pound, which amounts to as much as the loss in weight. When the vanilla is thoroughly ripe it is easier to ascertain the required point of curling, and besides it gives less trouble and is not so exposed to changes. It gets silvery white while being cured and in a few months is crystallized, and will be preserved in this way for a number of years. If cut when unripe just the opposite happens, for not only are few crystallized but their keeping quality is poor. After the beans are

DRYING, SORTING AND BUNDLING VANILLAS.

thoroughly cured, which takes from three to four months, they are assorted in different sizes and bundled in bundles containing from 50 to 75 each, the different cures having different amounts for their packing, some 50, some 60, others 70 and some 75 to their bundles. These bundles are all uniform in size, according to length, and are placed in cans of 40 bundles each; then four or five of these cans of different sizes are packed in a case made of Mexican red cedar, which is the most plentiful wood grown here. A curer stated to me that the making of these cases was the most expensive part in putting the bean up, as they have no machinery such as saw mills and planing mills; everything must be done by hand, which necessarily takes some time to make one of these cases, as the corners of each are grooved and dovetailed together, making the same cost when completed from \$2 to \$3.

After the beans are cased the cases are covered with a fiber matting made here by the Mexicans, and they are then ready for shipment. Mules or burros, in some cases mustangs, are drawn up in line and two cases are strapped on the back of each animal, and started for the sea coast in caravans of perhaps eight or ten animals with two or three men for attendants; then shipped on steamers for Europe and the United States. The authorities for some time have been endeavoring to get a railroad to Papantla, but as yet have been unsuccessful. The Aztecs or native Indians do not want to have any improvements. Several attempts have been made to survey a road, and I was advised of a civil engineer, sent to survey a route, who next day after his arrival was found hanging to one of the trees outside of the town. The natives do not want anything different from what they have been used to, and will sacrifice their lives in defense of what they consider their rights.

I returned to America with a conviction that notwithstanding our national character of penetrating to the utmost corners of the earth, as a people we know little or nothing of Mexico, a great, broad, rich, fertile land, magnificently endowed by nature and so favored as regards soil, climate and physical conditions, that in my judgment it is ere long to become the most prolific source of supplies for many of the essential and valuable products needed by the world, and of her varied and valuable industries none are more promising and give indications of more important growth than does the vanilla bean. The infusion of greater intelligence in the minds of the natives engaged in its development, the employment of better means for its preservation and cultivation, the opening of newer and larger districts for its supply, and a more intimate and scientific knowledge of its natural requisites, would in a few years multiply manifold the volume of this commerce, and would permit the product to be placed upon our market and the markets of the world in a far better condition as respects quality, and at a price that would largely stimulate its use. I returned to Philadelphia satisfied that my expedition had been of great practical value to me, and that if more merchants and business men, deeply interested in handling and marketing vanillas, had been induced to turn their interests and attention to the conditions and restrictions that surround

the production, many of the difficulties and hazards that retard its cultivation and make its production so precarious and mar its perfections, and so materially increase the cost of transportation, would in a few years be materially overcome.

I now look at the vanilla bean with a new interest. I see in it something of the history of a peculiar people. Its delicate aroma is to me suggestive of the bright blue sky, the blazing sun, the tropical luxury, and the rich atmosphere of the country where it grows—almost the spontaneous child of nature, yet so potential and useful in the varied needs of our complicated life of to-day.

I trust that the brief and hurried view of its habits and peculiarities that I have been able to give you in this brief talk have been of some interest and value from a scientific standpoint and may have tended to render more accurate and definite your botanic knowledge of the vanilla plant, and may have cleared away some of the uncertainties that have in the past clouded its history.

During 1893 the United States exported cotton-seed oil to forty-two different foreign countries, the amount of such exports reaching nearly 9,500,000 gallons, valued at \$4,000,000. This is a slight decrease over the previous year, but this is thought to be due more to peculiar conditions of trade rather than want of demand for the oil, as its use in the West Indies and South America is rapidly supplanting that of olive oil for culinary purposes. There are no available means of determining how much of our exported oil comes back to us as pure (?) olive oil, and the fact that our imports of olive oil for 1893 are in excess of those of 1892, while as before stated our exports of cotton-seed oil are less, makes the matter rather confusing even when a guess is attempted in the matter of adulteration. We exported to France 1,265,708 gallons, valued at \$450,036, over 5,000 gallons were sent to Spain, and 462,244 gallons, valued at \$166,490 were sent to Italy. Nearly two-fifths of our export were sent to Holland, which took 3,736,155 gallons, valued at \$1,588,000. It is used in this latter country to a great extent in the adulteration of butter, which is exported to India and Central and South America. Germany took 1,075,945 gallons; England, 761,884; Austria, 276,850; Mexico, 671,009; Brazil, 304,155; British West Indies, 130,131; French West Indies, 124,890; Cuba, 62,498, and Africa and Australia, 20,379.

Among recent receipts of rubber by a Panama steamer was one consignment stated as "Five Zerosons." A zeroon is a cow's hide, and to sew a commodity up in it is to provide a very safe means of transportation. It will not break or split, and the fastenings are of leather thongs. Being pliable, it makes the burden easy upon the back of the mule, by which mode of transportation the bulk of rubber finding its way to export on the west coast of South America is transported. Hides are cheap in that section of the world; still the envelopes can be utilized here after their contents have been removed. Zerosons are used considerably for indigo, but seldom for rubber; in this case the hide was perhaps the only available article.

PROPOSED INTERNAL REVENUE TAX ON ALCOHOL.

Under present regulations the internal revenue tax on spirits has been 90 cents per proof gallon, equivalent to about \$1.70 per gallon of 94 per cent alcohol.

The customs duty is \$2.50 per proof gallon, equal to \$4.70 per gallon on 94 per cent alcohol.

The wide range between \$1.70 and \$4.70, representing the internal revenue and the customs tax respectively, has permitted the great whiskey monopoly, commonly called the Trust, to manipulate its prices at will, and at one time there seemed to be nothing to prevent even a doubling of the price of alcohol.

The Wilson tariff bill proposes a duty of \$1.80 per proof gallon, or about \$3.38 per gallon on 94 per cent alcohol.

The proposed internal revenue tax is \$1 per proof gallon, equal to \$1.88 per gallon of 94 per cent alcohol.

It is easy to see from these figures that, if both measures are passed, the Trust will not have such a wide margin for activity as regards price raising as it has heretofore enjoyed, even were there no other factors in the way of opposition to be encountered.

TWO DECISIONS.

Agreements to prevent competition in trade are, in contemplation of law, injurious to trade, because they are liable to be injuriously used. If a combination between independent dealers, to prevent competition between themselves in the sale of an article of prime necessity, is, in legal contemplation, an act criminal to trade or commerce, whatever may be done under and in pursuance of it, is illegal, although the object of the combination is merely the due protection of the parties to it against ruinous rivalry, and an attempt is made to charge undue or excessive charges, the parties to the combination are amenable to the law. *People vs. Sheldon et al.*, 54 N. Y. S. Rep., 513.

Any dealer or associated dealers have a right to refuse to sell or buy from any particular dealer. That is an incontrovertible rule of law in its general expression. There may be a right to fix prices, and crush out competition in a legitimate effort to do that, and nothing more. But if the combination is unlawful, then the parties to it commit a misdemeanor and an offence against the State; and if, as the result of such unlawful combination and misdemeanor, a private person receives a private injury, that gives such person a right to private action. By the statutes of this State, it is a misdemeanor to commit any act injurious to trade or commerce, and to combine to create a monopoly and to ruin all who will not unite in such undertaking, is injurious to trade and commerce and a violation of law. *Dueber Watchcase Manufacturing Company vs. E. Howard Watch and Clock Company*, Supreme Court of New York, 24 N. Y. Supp., 647.

"Have you any faith in patent medicines?" asked the man who never feels well.

"I should say I have," replied the man who hustles. "Quickest means in the world for getting rich."

TRADE COMMENT.

DRUGGISTS SUPPLEMENTS.

The third (1891) edition of the Era Druggists Directory has now been issued, and we shall begin the regular publication of the "Supplements" to this new edition in this (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. Address

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

Indexes on first four red sheets.

Butter was anciently known as "oil of milk."

Several English chambers of commerce have begun an agitation in advocacy of a decimal system of coinage.

The patent medicine business of the late Ross Gordon, Lafayette, Ind., will be continued as formerly by W. R. Gordon.

The Columbia Chemical Co., of New York, have removed their offices and warehouses to 174 G street, N. W., Washington, D. C.

It costs 32 cents a box freight to bring lemons from Sicily to New York, and 50 cents to carry lemons from Florida to New York.

Artificial wood for furniture, roofs, insulators, etc., is now made by burning magnesite together with wood, shavings, cotton, hair or wool.

The La Ville Laboratory Co., Springfield, Ohio, has been incorporated, and will manufacture and place on the market Elixir Rheumatique.

The firm of D. W. Gross & Son, wholesale druggists, Harrisburg, Pa., was dissolved January 1st. The business will be conducted hereafter by E. Z. Gross.

An immense water power plant is being erected in Sweden for the electrical production of chlorate of potash, to be used in the manufacture of friction matches.

Stlvetts—"The German investigators are experts in bacillus hunting, aren't they?"
Whiffet—"Well, wouldn't you naturally expect a germ-man to cholera microbe?"

The Huron Remedy Co., Adrian, Mich., is a new concern which will manufacture a line of proprietary preparations, including Huron Tonic, Lewis' Cough Syrup, and others.

When his wife discovered a bottle of it in his coat-tail pocket he said it was ozodent. She said it was all right, "ozodent take too much of it."—Boston Courier.

Cologne water, which has heretofore been regarded as an agreeable toilet preparation, has been brought to the front by a French practitioner as a remedy for cold in the head. It is used by inhalation.

In a recent report, J. Sterling Morton, Secretary of Agriculture, recommends that whenever food preservatives are used in the preparation of canned goods, the fact should be stated on the can, leaving the responsibility of consumption to rest upon the purchaser.

A single match requires only 1-200 to 1-100 of a grain of phosphorus, yet the consumption of matches is so large that in Europe alone 1,200 tons of phosphorus are necessary to supply match makers.

The Treasury Department has ordered that statistics upon the export of oil cake shall be divided hereafter into two classes—those of linseed and those of cottonseed.

The English Inland Revenue Department has lately issued an order that hereafter the rebate on tinctures exported shall be determined by weight instead of measure of the tinctures as heretofore.

The numerous post-office robberies which have occurred recently have revived the idea that postage stamps should be numbered the same as treasury notes, so that they may be traced and identified.

The commissioner of patents has recently inaugurated the practice of publishing each day a list of patents which expire on that day. This method of imparting important information will undoubtedly be appreciated.

The Chicago Tribune estimates sums stolen and embezzled during 1893 at \$19,329,692, an increase of 100 per cent over 1892. Donations to charities, education and art in sums of \$10,000 and over, amounted to \$33,319,866, an increase of \$5,000,000 over 1892.

Lead poisoning may be prevented to a great extent by those who handle white lead by washing frequently in a decoction of oak bark and by taking care to rinse out the mouth before eating. Milk should be drunk frequently, but intoxicants should be left alone.

A successful attempt was made lately to transplant some of the finest varieties of cacao from Trinidad to Nicaragua. The seeds soon lose their vitality, and in this instance they were planted in glass covered boxes and allowed to germinate during the voyage.

Onyx, which has of late years come into vogue in the construction of soda fountains, has been discovered in Arizona. It is estimated that the quarries in that territory contain 4,500,000 cubic feet of merchantable onyx of the finest quality.

The design of the World's Fair medal which was recently submitted is meeting with a great deal of unfavorable criticism. A prominent congressman claims that it may be debarred from transmission through the mails on the grounds of indecency.

Senna and rhubarb, after being administered to a patient, are found to so distinctly modify the urine that it will give the various reactions for sugar, giving the bismuth test, reducing Knapp's and Nylander's solutions, and decolorizing Fehling's solution.

Prof. Harrington, chief of the Weather Bureau, has been directed by the Secretary of Agriculture to inaugurate some plan for the collection of reliable data relative to sanitary affairs, especially the relations which may exist between climatic and atmospheric conditions and the prevalence of epidemic or contagious diseases such as the "grip," diphtheria, etc.

The Globe Brewing Co., 626-632 W. 30th st., New York City, has bought the plant and business of the Ale and Beef Co. All orders for Ale and Beef Poptonized will hereafter be filled by them.

The firm of Wolfson & Stern, New Orleans, La., has been dissolved and the business is continued by H. G. Stern. This firm does a general jobbing business in druggists' sundries throughout the south, and are local agents for A. M. Tenney's fine confectionery.

It is reported that vaccination matinees are quite the fashion in Paris. The invitations bear the words "On Vaccinera," and persons belonging to fashionable society co-operate in arranging for the presence of a doctor and a cow at an afternoon tea. The company are all vaccinated from the cow.

Chapman & Rodgers, 510 Arch street, Philadelphia, are a new firm organized to engage in the manufacture of perfumes. Mr. Rodgers has long been a salesman with Schandlen & Lind, and Mr. Chapman brings to the firm a large experience in chemical and analytical work.

Recent German experiments on the action of filters show that under ordinary conditions the bacilli of typhoid are unable to pass through them. They can pass only when enough nutriment is contained in the water to allow them to grow in the porous substance of the filter itself, and this is not ordinarily the case.

One of the worst blows American chewing gum has been called upon to suffer, says a Chicago newspaper, comes from an exasperated Englishman who chewed a stick of it for two hours and then threw it away with the remark that he "couldn't masticate the blowed stuff to the swallowing point."

The Treasury Department has ruled that a drawback will be allowed upon imported glycerine which has been used in the dynamite and nitroglycerine exported from this country. The quantity of such glycerine is determined by allowing 4.4 pounds for each 100 pounds of nitroglycerine contained in the exported article.

A company has leased the Aldabra Islands, near the Seychelles, in the Indian Ocean, and intends to preserve and can turtle oil for shipment to Europe. The oil is claimed to possess medicinal qualities similar to cod liver oil, and the promoters of the enterprise hope to supply the latter to some extent in the European markets.

In commenting upon the establishment of a new medical journal as the organ of the colored medical profession of America, the Medical Mirror asks if we may not expect similar publications for the blondes and brunettes of the profession, and even goes so far as to suggest "The Redheaded Medical Journal of America."

The United States now possess the deepest metal-mine in the world, Shaft 3 of the Tamarack Copper Company, of Michigan, having reached a depth of 3,700 feet. There is only one deeper shaft in existence—that of a coal mine in Belgium, which is 3,900 feet deep; but as the Tamarack shaft is pushing downward at the rate of 75 feet a month, the Belgian mine will probably soon be distanced.

MR. INGRAM ON THE TARIFF.

The importance of the proposed tariff reconstruction, as it concerns business enterprises, led the Era to request from Frederick F. Ingram, of Detroit, an expression of his opinions, and these he succinctly sets forth below:

As business men, we are all interested in the tariff, in so far, at least, as the tariff affects our business. What I will say will be only from a business standpoint.

I believe the effects of the tariff changes as proposed in the Wilson bill are greatly exaggerated both by its friends and its foes. It will not prove the panacea foretold by the former; neither can it work the destruction to our industries predicted by the latter.

The most noticeable feature observed in comparing the proposed bill with the McKinley bill and the tariff bill immediately preceding it, is its remarkable likeness to the last mentioned, the tariff bill of 1883.

The unprejudiced observer might reasonably conclude it is the offspring, the legitimate child, of that bill, under which the country so prospered; for, taking the free raw material into consideration, the protection afforded the manufacturer under the Wilson bill is as great as that afforded under the tariff of 1883.

During the campaign that resulted in the election of the present government at Washington the country was divided into two great opposing camps—protection and free trade. Though the exponents of the latter principle triumphed, the Wilson bill, the result of their victory, is not a free trade bill.

No free trader can point to this bill as representative of his theories.

It is also repudiated by the protectionists.

It represents the views of no party that was a candidate for the suffrages of the people during that campaign.

It is, in fact, a compromise.

No doubt it is as strongly free trade as was possible, as strongly protection as was possible, and still pass in the present congress.

To the free trader it is a step in the right direction; it gives, or intends to give, the manufacturer the benefit of free raw material.

If the theory of the free trader is correct, this will benefit the manufacturer, enabling him to compete in price with his foreign rival, enlarging his market and increasing his output.

It will also give greater opportunities to labor by making a greater demand for labor.

The free trader finds satisfaction in believing that this result, sure to follow the passage of the bill, will popularize a low tariff and will lead to still further reductions, until we are finally landed on a solid and impregnable free trade basis, when the tariff will cease to be a political question, the rates will not be changed by every congress and manufacturers and other business men will not be haunted by fears of impending ruin through tariff tinkering, certainly a desideratum devoutly to be wished.

The protectionist also finds reason for composure when viewing the Wilson bill. The period from 1883 to 1890 was a more prosperous period than the three years following, and as prosperous as any period of equal length preceding it since the civil war.

From a protectionist's standpoint, the Wilson bill is at least as satisfactory as that of 1883 to the manufacturer.

During the campaign of 1890 the protectionists were not fighting for higher duties, but for a retention of the duties then prevailing.

They were satisfied with the duties as they then were, and fought for their retention.

Flushed with victory, they took more than they asked for, and, by increasing the rates through the passage of the McKinley bill, caused a revulsion of feeling, leading to the election of the present congress.

It is needless to refer to the charges and countercharges made by the Republican and Democratic politicians, whether it was the McKinley bill, the over-protection caused and the increased burden of taxation imposed by it, or the fear of the Wilson bill that has caused the panic and depression in business that has prevailed the past year.

Probably both are responsible, in a measure, and neither is entirely to blame.

In many lines of goods we can now compete successfully with the foreign manufacturer, though handicapped by a heavy duty on raw material. Relieved of that burden, as we will be by the Wilson bill, we should drive the foreigners out of the market.

Congressman Grosvenor, a high protectionist, in the course of a speech on the Wilson bill January 13, furnished an object lesson in reply to Mr. Stimpson's oration of the day before in illustration of what protection had done for the country. He called attention to the suit of clothes which he wore, which, he said, he had purchased yesterday afternoon for \$10.80. It was guaranteed, he said, to be all wool.

He exhibited, in contrast, a suit he had purchased in England, for which he paid \$16.50, which, in material and workmanship, was inferior to the American suit. The exhibition caused great amusement.

If the American manufacturer of woollens can undersell the English manufacturer in his own market by 40 per cent, paying, as he does, the enormous present specific duty on wool, his raw material, what show will the British manufacturer have when the American is given an even chance with him?

So far as the drug trade is concerned, I believe the Wilson bill will prove a benefit.

Foreign patent medicines are taxed out of the country, as they should be.

If domestic patent medicines suffered a like fate, it is a question if the drug trade, on the whole, would not be benefited.

The duty on alcohol has been reduced to \$1.80, which will prevent the trust from practicing further impositions on the trade.

Most crude drugs have been placed on the free list.

The duty on bottles is reduced one-half.

The duty on chemicals has been lowered. It is still sufficiently high to afford the American manufacturer sufficient protection.

Owing to what I believe was an oversight on the part of the committee on ways and means, the present rate on flower pomades, the perfumers' raw material, was retained, while the rate on finished perfumes was reduced one-half.

Should this remain unchanged and the bill pass in its present shape, the perfume industry would certainly suffer.

This is such a palpable mistake that it will surely be corrected.

All the perfumer has a right to ask and all he wants is free raw material, or the retention of the present duty on finished alcoholic perfume.

As for ourselves, our shipments are a trifle less than a year ago. We have, however, laid off no employes and will not, and are running full time.

We are conducting our business on the basis that any change will be for the better, and are accumulating a finished stock that will enable us to take advantage of the business boom that is sure to accompany the "better times a'coming" that I believe are near at hand.

What we should all do now is to quit talking and go to work. It is continual agitation and discussion that is hurting us.

The country has been talked into a fit of sickness.

Be we Republicans or Democrats, to enforce our argument regarding the tariff we must refer to the hard times; this makes hard times. Let congress pass the bill in whatever shape it finally assumes and go home.

In this broad land of unlimited resources, with its seas and its mountains, its forests and prairies teeming with natural wealth, peopled as it is with the most energetic and thrifty and intelligent race on earth, we are not dependent on favors from Washington.

All we need ask from there is to be let alone. Let them pass the Wilson bill and guarantee they will not disturb business again by changing the tariff for ten years, and the Yankee will, commercially, conquer the world; and we can say, in the words of a patriotic Englishman, substituting "American" for "Briton" "From east to west, Atlantis to Cathay, The noble Briton airs his sovereign sway, Northward and southward, wherever man can live.

He does, beyond, his missionaries thrive;
Further, his bones are found; past them, his fossil;
Beyond them all his advertisers jostle. Each rocky desert, unfrequented space. Bears some memento of this hardy race. Sahara knows its soap, Slam its saucers, Congo its liver ailments and their causes. Where'er we go we find some record written.

Nature was made to advertise the Briton."

FREDERICK F. INGRAM.

Detroit, Mich., January 17, 1894.

Long before yacht racing was thought of as a sport, the American sloop was famous, says Outing for December. In 1783 a sloop of only forty tons sailed from Boston, bound on a voyage to Canton, laden with a cargo of American ginseng root, then, as now, highly esteemed by the Chinese as a medicine. Touching at the Cape of Good Hope for provisions, her commander, Captain Hallett, found a number of English ships homeward bound from Canton. The English captains, fearing the entering wedge of American rivalry in this enterprise—for this was the first American vessel to engage in the trade—bought out Captain Hallett's cargo of ginseng, giving him two pounds of fine tea for each pound of the root. This made it quite profitable for the Bostonian. But the little scheme by no means prevented our countrymen from seeking commerce in the Orient.

NEW SCHOOL ADVERTISING FOR DRUGGISTS.

Attractive advertising has reached such a point of development during late years that the fortunate possessor of a faculty for designing such means of drawing trade has a distinct advantage over his less favored competitor. This new idea, we might call it "fad," has been industriously fostered by a large and increasing number of bright minds, who diligently set themselves to work to find out what people liked to look at in a typographical way, and after determining the question to a degree of certainty, quite as industriously set themselves to the task of satisfying this latent demand. This demand, however, like all others which have a solid foundation in good taste and propriety, is one not easily satisfied; the public is mightily pleased with the effort of to-day and applauds without stint, but it asks for something better to-morrow. In agitating the question of art and taste in advertising the originators of the idea certainly builded better than they knew. Their creation of a demand which gives rise to other demands was possibly beyond contemplation at the start, but there is no trouble in summing up the result, which has been to interest the public in the reading of advertisements and to give employment to a great number of people who now devote their energies to the writing of advertisements. The statement relative to interesting the public in the reading of advertisements is made advisedly. The people do read them, and the modern advertiser is now furnishing them something worth reading. The intrinsic value of the goods advertised is often questionable, but the

We are now located next door to the Post Office.

**GEO. SCHOELL & SON,
Druggists,
Belle Plaine, Minn.**

fineness and literary strategy displayed by the skilled writer are of a character that attracts attention, and the public quite unconsciously adds this skill in the display of words to the goods themselves, and it goes further than is often

suspected in enhancing the doubtful question of "a bargain."

It has been discovered, not very long ago, either, that the public was tired of fine print advertisements, and only read them in sheer desperation after all other available reading matter was exhausted. It was observed that people got tired of seeing the same advertisement over and over again, and that the stereotyped statements which merchants were wont to make regarding their business were, after a certain length of time, treated with the indifference which they deserved. Some bright genius, after hearing the statement several thousand times from several thousand people that they "merely glanced over the advertisements," took the term "glance" as his watchword and began to construct advertising matter that just suited the "glancers." He constructed headlines and footlines that could be read at a glance. He resurrected the idea that brevity was the soul of wit and took one idea or article at a time, and exploited it in such a manner that it could all be taken in at a glance. The new departure attracted attention, and now we venture to say that the advertising columns of every average bright publication are read with interest and appreciation. The public has set its seal of approval upon the new style and expects and looks for something new and bright every time they scan the advertising pages. All branches of trade now recognize the existence of these new ideas, and the preparation of copy for the advertisement in the "next issue" is one which now calls for considerable study and invention and its final appearance involves as much solicitude and anxious inquiry as that which perplexes the average woman in satisfying herself that her hat is on straight. The canons of the new school of advertising may be very briefly stated. They include brevity, the consideration of one thing at a time, and the employment of the best and the best only of typographical art in dressing words and ideas for public inspection.

The first point, which is brevity, should be uppermost in the mind of every writer of advertising. There is a too evident disposition to say too much; too much of a disposition to crowd in as much as possible under the impression that as the space is paid for, it should be fully occupied. But the people will not read it. They much prefer a good white background for a few well-chosen words in plain black type. They do not have to strain themselves to read such advertising. Then there is the question of one thing at a time. People are always suspicious of hash, and the "olla podrida" style of advertising does not meet with favor at present, unless it is spread out so that the ingredients can be plainly identified. People do not care for an advertisement in the dead of winter that includes a standing reference to last summer's soda water, sunburn lotion or paints and varnishes, but will stop and look at one which refers to cough mixtures and chill-bain removers. Seasonable goods and one thing at a time is the motto for the present, and no business man on earth has a better opportunity for following out this idea than the retail druggist. Taste and skill in the setting up of an advertisement are another important consideration. This is largely within the province of the printer, but the advertiser can

do one thing to facilitate matters, and that is to insist that his advertisement shall be set in an attractive manner. As illustrations of some of the ideas referred to, two advertisements contributed by one of the Era's readers, are repro-

Window Glass

The approaching cold weather reminds you that there are several window panes broken in the house. We have a large stock of glass in all sizes. A tape measure is

by us to enable you to measure the sizes. Call and get one.

**GEO. SCHOELL & SON
Druggists,
Belle Plaine, Minn.**

duced here. They are both designed to attract attention—and they do. They deal with but one subject and they are set in a fairly attractive manner.

The retail druggist will find that the road to attractive advertising is not beset with as many difficulties as he possibly supposes. The printing fraternity is becoming alive to the possibilities and necessities of the situation. The average printer or newspaper publisher, and this includes many of the small country papers is now served by a number of bright and enterprising trade papers, which are doing effective work in educating their readers up to a higher standard for the mechanical and artistic features of their publications. Many publishers are alive to the importance of having their advertising columns set attractively. They have struggled ineffectually for years in trying to make good reading matter appear "spicy" when set side by side with old black faced "ads" with moss and whiskers on them, that persisted like parrots in repeating over and over words that had long since lost their meaning or relevancy. The printer has expressed a willingness to reform—the druggist should help him.

The president of the Missouri State Pharmaceutical Association says: "Take as many pharmaceutical journals as you can pay for and take the best. It is a paying investment provided you keep posted as to their contents. A single number may contain one item which will pay for the journal for several years."

For four years Raymond & Co. have had in the Era a standing offer to retail druggists. All who have "kept posted" and taken advantage of the offer have made money. One druggist has made over \$200 on Raymond's Pectoral Plasters in the last two years. It does not cost much to "keep posted," and it pays. Why haven't you kept posted?

HOLLAND GIN.

The records of the past give us no definite information as to the original discovery or first manufacture of the liquor which is now known the world over by the name of "gin." At the time of the invasion of the Low Countries by Charles V., gin was an important product of Holland. Its antiquity is also verified by the records of those who have met that relic of the past, "The Flying Dutchman," whose crew are always described as indulging in potations of "schnapps."

The introduction of gin into the new world was doubtless coincident with the arrival of Hendrik Hudson at Nieuw Amsterdam (as he named it). The kegs of liquor which Rip Van Winkle was obliged to carry up the mountain for the detection of Hudson and his ghostly crew was a part of the first importation to this country.

It is more than probable that the ancient disciples of Esculapius who, in the middle ages, and before, paid great attention to the use of herbs in medicinal preparations, early discovered the properties which were contained in the juniper berry, and, by steeping the berries in spirits, made a crude extract, afterward improving the manufacture into one of distillation.

Gin owes its medicinal properties, characteristic flavor and name to the juniper berry, usually a shrub from two to six feet high, but which, in favorable localities, as in northern Italy, attains a height of twenty-five feet.

The fruit of the juniper contains, before ripening, an essential oil—the oil of juniper. At the full maturity of the fruit this oil changes to a true turpentine, so that, to obtain the juniper oil, the fresh green fruit must be used.

The name "gin" is derived from the juniper through the French "Genievre" (meaning juniper), corrupted into "Geneva," and in Holland "Jenever." From the city of Schiedam, which is almost wholly devoted to the manufacture of gin, comes the designation "Schiedam Schnapps" (Schiedam spirits).

The manufacture of gin in Holland being one of almost national importance, the term "Hollands" is often used to designate the article. That the term is not unjustifiable is shown by the fact that in one year the spirits distilled amount to over ten million gallons, the grain and malt mills supplying fifty-three million pounds of rye meal and forty-seven million pounds of malt; yet the Dutch are not an intemperate people, the larger part of the manufacture being exported to foreign countries.

Each distiller of the finer grades of gin claims to have his own secret ingredients or process of manufacture not known outside of the distillery, and by which he is enabled to produce a finer quality, or better-flavored article, than his rivals. While this is in a few cases true, care in the manufacture, cleanliness in the details, and the selection of the best, both of spirits and juniper berries, is the "secret" which not all of them have yet learned.

While varying somewhat in details, the process of manufacture is as follows: A mash is prepared consisting of one part of malted "bere" or "bigg" and two parts of rye meal, with four parts of water at a temperature of 162 degrees Fahr. After infusion, a proportion of cold water is added, and when the heat is reduced to

about 80 degrees Fahr. the whole is run into the fermenting vat, to which about one-half gallon of yeast is added. Fermentation speedily ensues, and in about two days the attenuation is complete, although at this stage nearly one-third of the saccharine matter in the liquor is undecomposed. The special features of the fermentation are the small proportion of yeast employed and the imperfect attenuation of the worts. The wash so obtained is distilled, and the resulting low wine is redistilled with the addition of juniper berries and a little salt; sometimes hops are added in the final distillation. The final product is run off into large underground cisterns lined with porcelain tiles, where it can be kept indefinitely without obtaining color. It is drawn off as required into casks which have been previously treated to avoid coloring the contents.

Dutch gins vary much, one from the other, but generally they are much purer and mellow than the more highly flavored and frequently adulterated British gins.

Ferd Rutmann & Son, of New York, are probably as well posted upon Holland gins as any firm in this country, and in a recent article in Bonfort's they say that there is much variation in the ingredients employed, and cardamoms, cassia, or cinnamon are often used in flavoring. An article called gin is prepared by mixing spirits with certain proportions of the essential oil of juniper without redistillation, and a great deal of inferior liquor is made with oil of turpentine and aromatic substances, the juniper berry not entering into the composition.

To give some idea of the extent to which adulterants are used to produce liquors which are sold under the name of gin, the following substances have been found in them by chemical analysis: Alum, carbonate of potash, oils of juniper, cassia, nutmeg, lemon, sweet fennel, caraway, coriander seeds, cardamoms, capicum, creosote and even sulphuric acid.

To prevent cloudiness and turbidity, which inferior and adulterated gins would show when mixed with water, alum, carbonate of potash, acetate of lead, and sulphate of zinc are added. To give an artificial pungency and mellowness, grains of paradise and cayenne pepper are used, and the absence of spirit covered by sugar.

Very few distillers of gin now manufacture directly from the grain, but obtain the moutwijn from the numerous distillers of that article, the price being quoted from day to day on the Exchange, varying according to supply or demand; a few use, instead of moutwijn, a spirit manufactured from potatoes, and called "potato spirits."

Until recently the manufacture of gin has been confined to Holland and England, but of late years its manufacture has been introduced into the United States. While many American distillers claim to produce a purer, finer, and better grade of gin than any imported, they have as yet failed to produce, even by means of the "Holland process," an article equal to that obtained by the patient Dutchman with the results of years of experience and improvement—slow but sure.

Remember that all the indexes for this issue will be found upon first four red sheets.

S. M. CROMBIE.

This "person" followed the advice and notable example of Garfield and General Grant, and was "born on a farm," and many of his friends still declare that an excellent "granger" was lost to the country the day that Mr. Crombie drifted from the Oakland County farm to Ypsilanti, Mich. But such is life in the far west. Believing that the three "I's," Industry, Integrity and Intelligence, would have some bearing on his future success in life, this horny-handed son of toil entered the Michigan State Normal School at Ypsilanti, for a four years' course, and having finished the work at this point, took up the study of pharmacy in Michigan University at Ann Arbor. For a short time after graduation Mr. Crombie labored in the laboratory of Chas. Wright & Co., moving later from Detroit to Chicago, taking a position in the city order department of Humiston, Keeling & Co., wholesale druggists. Leaving the employ of the latter firm, he next accepted an offer from the Rumford Chemical Works, for a short time in the office, and later on as a traveling salesman, and after two and one-half years' service, resigned on January 1, 1888, to represent Eli Lilly & Co. as salesman through Kansas and Missouri, with whom he has been associated during the last five years, the greater part of the time in Wisconsin and Minnesota, with headquarters in Milwaukee.

Although it may be true that the "rolling stone gathers no moss," Mr. C. resigned his position with Messrs. Eli Lilly & Co. in December, and in future will call on the trade of middle and northern Michigan, Wisconsin and Minnesota, working on a brokerage basis. In addition to one or two other accounts, the former apostle of "Eli" will handle the products of Messrs. French, Cave & Co., of Philadelphia, whose goods are fast coming to the front, and will aim to add somewhat to the sales of their celebrated "Sweet Chimes Perfume" in 1888.

Mr. Crombie's leading characteristic is modesty; and being a devoted follower of "Izaak Walton," and a "Mighty Nimrod," he has even a few "fish" lies left, and his reputation in this "line" has long ago preceded him in the land where the thump of the mortar and pestle makes merry music for the ear of the northwestern retail drug man.

Paper can be made of over 50 kinds of bark, over 100 kinds of grass, banana skins, bean stalks, pea vines, cocoon fiber, hay, straw, sea weeds, hair, fur, wool, asbestos, leaves, husks, moss, sawdust, shavings, stistles, tobacco stalks and tan bark. There are over 2,000 patents in this country covering the manufacture of paper.

TRADE NOTES.

EASTER DYES.

These may be obtained of the following firms, all of whom have advertisements in this issue:

O. A. OHL, Tiffin, Ohio.
PAAS DYE CO., Newark, N. J.

Special attention is directed to what is believed to be a decided improvement in the Index of Goods which was inaugurated in the issue of January 1st. It is believed that the readers of the Era can now, by turning to pages 21 and 23, on the first red sheets in each issue, easily find any article in which they may be interested.

The Marshall Medicine Co., of Kansas City, Mo., has been organized with a paid up capital of \$100,000.

The Boston Petty Ledger, manufactured by A. G. Moore & Co., 47-49 Court street, Boston, is a handy arrangement for keeping accounts with a minimum of expense and labor and its simplicity recommends it at first sight. Over 25,000 have been sold, which fact is certainly an indication of its merit. Write for circular and sample pages and mention the Era.

Owing to the increase in their business the firm of Frederick F. Ingram & Co., of Detroit, have recently removed their Chicago branch into larger and more convenient quarters at 110 Randolph street, third floor, with John Block Drug Co., Telephone Main 4165. Mr. E. Frank Baker is in charge of the Chicago branch, and has a complete line of Wing's perfumes to show to the trade.

The best and cheapest is what every druggist is looking for when he purchases corks. The R. W. McCreedy Cork Co., 47 Illinois street, Chicago, claim that these terms are synonymous and that their trade mark "Diamond M" is a synonym for both terms. They invite the drug trade to test their assertions by testing their corks, and the proper way to do this is to qualify the next order for corks by quoting "Diamond M" in connection with it.

There is no man in the drug business who could not find dozens of uses for a four-line self-inking rubber stamp, if he had one. When such an article is given away, the enterprising druggist should be on the lookout. He should carefully consider the offer of Geo. W. Holloway, 87 N. Salina street, Syracuse, who sends free such an article with druggist's name and address, in connection with an order for Holloway's 'Herb Tea', accompanied by \$2. This order includes 250 sample packages of the Tea, and a lot of counter wrappers, etc.

Last year the O. & W. Thum Co., of Grand Rapids, Mich., extensively advertised their Tanglefoot Holder by putting two free into each box; over two million were thus distributed. The inquiries lately made show that they were appreciated by a very large majority of the dealers and their customers, and that their popularity has deservedly increased. The object being accomplished, the company will, as in former years, pack only one with each box for the dealer's own use, or for him to present to some good customer. Extra Holders can be obtained through the jobbers.

If you want anything in the way of Jugs, or jars for ointments, pomades, acids, etc., the Akron-Canton Stoneware Agency, 225 Lake street, Chicago, can supply you. Send for their catalogue; they handle stoneware of all sizes and descriptions.

The Cudahy Pharmaceutical Co., of South Omaha, Neb., are distributing a fac simile of the official blue ribbon received by them at the World's Fair. It reads "Premium for excellence in quality and flavor on Rex Brand Beef Extract exhibited by the Cudahy Pharmaceutical Co., South Omaha, Neb."

The fact that the Welch Grape Juice Co., of Vineland, N. J., produced 40,000 gallons of grape juice during 1893 is pretty good evidence that their goods are of a character which creates a demand. The purity and fine color of their unfermented grape juice are qualities which have brought it into its present favorable position with the physician and consumer. Sample 2-oz. bottle will be sent free to druggists. It is a great favorite with soda water dispensers.

Charles Allen Reed, of No. 9 Cliff street, New York, gives some very cogent reasons why Callisaya La Rilla should be handled by the retail druggist, and asks the pharmacist in a very frank manner to consider both sides of the question which arises when the expediency of the home manufacture of preparations of callisaya come up. It is a question which involves the success of the physician and indirectly that of the pharmacist, and is to the latter one of dollars and cents also. The prices and quality of Callisaya La Rilla should be investigated.

Beach & Claridge Co., of Boston, Mass., desire to call the attention of the drug trade to the fact that they give special attention to wants in the soda water line. Their goods embrace everything in the line of flavors, pure fruit juices, etc. They furnish a most attractive line of advertising for their patrons in the way of fountain hangers and transparent window signs, and their copyrighted formula book, which is furnished with first orders, is an exceedingly valuable and useful publication. If you have a soda fountain you need their help. Send for catalogue.

THE WORLD'S FAIR FOR SALE.

LOOK AT IT! The Michigan Central has arranged with one of the best publishing houses in the United States for a beautifully printed series of World's Fair pictures, to be known as the Michigan Central Portfolio of Photographs of the World's Fair.

The original photographs would cost not less than a dollar apiece, but the Michigan Central enables you to get 16 pictures for 10 cents.

If you saw the World's Fair, you want it as a perpetual souvenir of a memorable visit.

If you didn't get there you want this to see what you missed, and to fill your mind with the beauty and glory of the White City.

Call on the nearest Michigan Central ticket agent, and he will furnish you with the first part and tell you more about it, or write to O. W. Ruggles, G. P. & T. A., Chicago, enclosing 10 cts. for the collection.

The Connecticut Witch Hazel Co. recognize the fact that competition is the life of trade, and they have entered the field realizing fully that only the best goods can create competition. Their distillate is manufactured while the bloom remains on the witch hazel bush and is thus claimed to be the best product both as to aroma and strength. The company has distilleries at Chester, Hadam and Killingworth, Conn., and offices at 132 Nassau street, New York.

Cushman's Menthol Inhaler furnishes one of the best means for the application of menthol, both as a remedial agent in acute diseases, and a mild, soothing exhilarant for use in cases of insomnia, nervousness, lassitude, etc. The inhaler consists of a glass tube four inches in length and one-half inch in diameter, open at both ends. It contains pure crystals of menthol, confined at each end by a hollow cork covered by a perforated cap, allowing the air to pass freely through the mass, and thus become thoroughly mentholized. The apparatus is advertised in such a manner as to create a demand through the retail druggist, who can obtain it of all the leading jobbers. Order of the jobbers, but send your label for printing your address on 250 Japanese napkins for your soda fountain, books, cards, etc., to the proprietor, H. D. Cushman, Three Rivers, Mich.

There is one important period in the life of every individual when he feels a disposition to withdraw from the active duties of life and avoid, as much as possible, contact with his fellow men. This period is popularly known as the time when a "vaccination is working," and its disadvantages are only assumed as the lesser of two evils. The intelligence that these unpleasant consequences of vaccination can now be avoided will be received with genuine pleasure, except possibly by some who will blame the inventor for not coming to the front years ago. Robert Stevenson & Co., of Chicago, have lately put upon the market a vaccination shield which is illustrated above and it is doing no violence to a well-worn phrase to say that it fills a long felt want. It consists of a ventilated disc or shield of aluminum provided with bandages which hold it securely in place over the vaccine eruption, thus allowing its wearer as much freedom of movement as if the eruption did not exist. This invention is sure to be a great seller, as the demand for it will exist as long as the benefits of vaccination are apparent.

There is probably no product that has lately received more attention through the columns of the medical and pharmaceutical press than Peroxide of Hydrogen. Its medical qualities have gained for it a prominent place in the U. S. Pharmacopoeia, 1890, and the pharmacist is now in a position to pass judgment upon its purity and general characteristics. Larkin & Scheffer, manufacturing chemists, St. Louis, Mo., call attention to their brand of this preparation as "an ideally perfect product," made in strict accordance with the requirements of the U. S. P. 1890, and invite the drug trade to give it a trial upon these positive assurances.

The retail druggist is well aware that a case for mailing liquids is a very useful article to have at hand for emergencies. As the latter are occurrences beyond the range of prophecy there is nothing like being always prepared. There is no telling when your physicians or customers may desire to send liquid preparations by mail, in fact a readiness to fill an occasional demand usually results in an increase of demands to be filled. Druggists will therefore find that a small stock of the goods of the United States Mailing Case Co., of Boston, is an investment which not only pays upon its face but brings additional business.

FOOTE & JENKS TO THE FRONT WITH A BRIGHT NEW CARTON.

Beginning with the new year, we have arranged to supply a handsome new carton for our No. 608 bulb bottle for our Triple Extracts, so as to make them a much more desirable package for handling, either by jobbers or retailers.

The cordial reception given our 8 oz. perfumes in style No. 608 has induced us to continue to sell all regular Standard F. & J. Perfumes in the following list of odors, put up in half pint bottles at \$3 per pint:

PER BOT.	PER BOT.
White Rose..... 1.50	Crab-Apple Blossom..... 1.50
White Heliotrope..... 1.50	son..... 1.50

FOOTE & JENKS, Perfumers, Jackson, Mich.

No. 608, 8 Oz.

Remember that the indexes for each issue are always to be found on first red sheets.

Those druggists who are not taking advantage of The Merz Empty Elastic Capsules in making up their own elastic filled capsules, as well as the special prescriptions of physicians, are losing both money and custom, and don't know what they are missing.

Perrenot, apothecary, corner Lancaster and Girard avenues, Philadelphia, says, under date of January 12, 1894: "I have been using your elastic capsules and don't know what I would do without them." Take time by the forelock and order a sample thousand of your jobber, or by remitting direct to the manufacturers, The Merz Capsule Co., Detroit, Mich.

The harvest of next summer is one which concerns the retail druggist, and his own particular harvest in the way of a good soda water business is one which requires careful preparation and considerable thought. D. H. Bates & Bro., Dayton, Ohio, call attention in this issue to several implements for the cultivation of this particular field, among which are their two machines for shaving ice for soda fountain use, the Star and the Polar. They also call attention to an effective means of getting rid of flies around the soda fountain, by the use of their Star Electrical Ceiling Fans. All these appliances are useful and soon pay for themselves. Send for catalogue.

Fine fixtures and appointments will not make fine soda water. The idea which is found in the old story of the famous painter, who, in reply to an inquiry as to what he mixed his paints with, replied, "Brains," is quite apropos in connection with the dispensing of good soda water. It requires brains. The publishers of Saxe's New Guide were cognizant of this fact, and their work, containing 160 choice formulas and many hints regarding the business, will be found to supply what every progressive dispenser will recognize as a necessity. The price has been reduced from \$5 to \$3, and at this hard times basis is certainly within the reach of every druggist who desires to make a success of his soda water trade. Address The Saxe Guide Publishing Co., 409 Dearborn street, Chicago, Ill.

There is nothing like having the confidence of your patrons, but this cannot be gained if you are in the habit of rinsing your soda glasses in a bucket under the counter. There is a slight suspicion of uncleanness attaching to this method. The tumbler washers manufactured by L. L. Rowe, 16 Howard street, Boston, Mass., do away with all this suspicion. They can be placed in plain sight if desired, and the operation convinces the customer that everything is perfectly clean, as it should be. Rowe's latest improved automatic washer has a brush attachment in addition to the water jets, which makes assurance doubly sure in the matter of cleaning tumblers. Any druggist who contemplates improvement in his soda water dispensing department should write for prices and description of these fixtures.

MARDI GRAS CELEBRATION AT NEW ORLEANS AND MOBILE.

The Cincinnati, Hamilton & Dayton Railroad will make rate of one fare for the round trip from all points to New Orleans and Mobile, account of the Mardi Gras Celebrations; tickets on sale January 30th to February 4th inclusive, final limit returning, February 28th, 1894.

Bell-Cap-Sic Plasters are well advertised in all the first-class magazines and leading papers, and as a natural consequence they are good sellers. The elegant oleograph "The Puppies" is a great hit, and it is also playing an important part in the advertising of these goods. The special offer on these plasters which will be found in this issue of the Era is worthy of careful attention. All orders should be sent to J. M. Grosvenor & Co., 105 Milk street, Boston, Mass., but the goods will be shipped through the jobbers. Mention the Era when writing.

LADD HILL STOCK FART.

Dr. F. L. Gerald, of Laconia, N. H., writes as follows: "In my opinion Quinn's Ointment is the best preparation ever made to remove bunches. I have removed two splints and a curb, and have half a box left. It seems to be painless in its action, which is something I have never seen with any other blister. I have recommended its use for at least two years." For curbs, splints, spavins, wind-puffs and all bunches, use this wonderful remedy. Quinn's Ointment is endorsed by the leading breeders from Maine to California. It will pay all druggists to carry it in stock, and if you desire advertising or will send the name of ten or twelve of your customers who are in the horse breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward them, without charge, trial packages.

IMPROVED EMPTY CAPSULES FOR MEDICATION IN THE RECTUM.

H. Planten & Son, New York, the well-known pioneer capsule house of the United States, have recently placed on the market an improved empty capsule, of which a sketch is shown herewith, for medication in the rectum. The ordinary cone-shaped suppositories which have so long done duty are easily expelled, causing much aggravating annoyance and disappointment to both physicians and patient.

The shape of these Empty Rectum Capsules is in accordance with the suggestions made by Mr. Henry S. Wellcome in his lecture before the Amer. Pharm. Assoc. at their annual meeting in Chicago.

This improved or Wellcome shape will be found in every way superior to any Empty Gelatine, Cocoa Butter or Gluten Suppositories now on the market, and pharmacists should send to Messrs. H. Planten & Son, New York, for samples and literature on the subject of their Planten's Improved (Wellcome) Rectum Capsules.

NEW ENGLAND VACCINE CO.

With small-pox getting a foothold in Boston for the first time in many years, and vaccination going on at the rate of more than two thousand persons a day, it becomes interesting to know where the virus comes from. Almost all that is used in that city is supplied by the New England Vaccine Co. The company has a farm in Keveer and stables in Chelsea, and during a visit to the latter by an Era representative, Dr. Wm. C. Cutler, physician in charge, gave many interesting details regarding the manufacture of vaccine points.

"This animal," said Dr. Cutler, sitting on a stool behind one cow, "you see, was inoculated seven days ago, and the men have been charging the Ivory points from the vesicles all day to-day. These vesicles are just like vesicles of small-pox on a human being. We take especial care to have the lymph perfectly clear, and while you may have noticed a little blood on the Ivory point with which the cow was being inoculated, there is none whatever on this, nothing but the pure lymph. See that drop coming from the sore? See how pure it is? That has to be caught up instantly."

Then the doctor caught the virus on the end of a small Ivory point. It was a dainty little piece of Ivory, about an inch long and an eighth of an inch wide, and as thin as a wafer. "The end, you see," said the doctor, "is sharp with beveled edges, just like those of a knife, so that the surgeon can make the scar with it on the arm of the patient, then insert the lymph and throw the point away. That makes everything safe, because even a surgeon's knife is apt to become dirty, or have matter of some kind adhere to the blade." The doctor continued to pick off the virus on the small Ivory points, and then lay them down carefully on a round tin plate, on which there were hundreds of little points already dipped, and all carefully laid in circles. In a case on the other side of the room a score of tin plates, exactly like those being used by the men, rested on shelves, like pies at the baker's, the small Ivory points all carefully laid, and the whole case protected by a fine wire screen. "We have to protect the points from the flies and dust," explained the doctor, "for one fly could spoil a puff of lymph. Every precaution must be taken to have the points and the lymph clean. All you see in that case were dipped to-day. There are about 3,000 points. How many points do we take from each cow? Well, I should say about 1,000. An animal, after being inoculated and staying here seven days, spends one day in the operating room, then it is sent back to the farm. Nearly all of these points, however, have to be charged again and from a different cow. We always charge them twice, because that makes them surer; if the virus from one cow does not take, that from another is pretty sure to."

Thousands of Ivory points have been sent out from the office of the company, on Broadway, Chelsea, during the last few weeks, and the demand for the lymph is growing greater. A corps of young women put up the bits of Ivory in little tin tubes, the virus being carefully protected with wood.

"We have been shipping large orders to Cincinnati, Chicago, Brooklyn, New York, Baltimore, Pittsburg and scores of small cities and towns," said Dr. Cutler. "We

have been sending out on an average about 4,000 Ivory tips a day, but the demand is growing greater, and will probably reach four times that amount. We sent out 5,000 to-day, 3,000 of which were ordered by the Board of Health of Boston, and this morning the board ordered 2,000 more. Chicago has been sending in large orders ever since the fair closed. I have heard it stated that there were many cases of small-pox in the city during the summer, but that they were kept quiet until after the exposition had closed. Now the Board of Health has awakened and is working night and day. The Pittsburg Board of Health orders quills instead of Ivory points," continued Dr. Cutler, exhibiting a bottle filled with quills charged with virus. "I presume that they cut the quills up and make them do double service. This is sometimes done with the Ivory points, but it is not a good way to economize. We have been getting these Ivory points for twenty years from a factory at Deep Rivers, Conn., and they have become much more popular with physicians than quills, so much so that we seldom get orders for quills."

"There is something interesting," he continued, holding a vial up to the light. "That is pure liquid virus; you see, it is clear as water. It isn't often you see it in such quantities, and even this is too old to be of much use, but we keep it as a curiosity. I have something else," and the doctor showed what was apparently a small strip of glass, almost as fine as a needle, about three inches long, with an inflation at the center of it. "That is hollow," he exclaimed. "See, here is another," and he held up one with red sealing wax on both ends. "We draw the virus into that, make it air tight, and send lymph great distances. We have shipped it to China, the Sandwich Islands and many other countries. But you understand it must be kept fresh. We have no stock on hand. Points charged to-day will probably be used by doctors to-morrow. It is ten years since the demand for virus has been so great. At that time we supplied Boston with 5,000 points a day. In 1872 or '73, just after the big fire in Boston, small-pox reached its greatest height, and about 15,000 points were furnished. The big fire drove the patients out among the people, and the disease spread."

Sherwood's patented specialties of white lustral wire, manufactured by Woods, Sherwood & Co., Lowell, Mass., include so many articles of utility to the druggist that the catalogue of this firm should be in the hands of every wide-awake pharmacist. Their line of goods includes many forms of brush and soap racks, sponge and paper baskets, picture easels, show stands, etc. The druggist can easily select from this list a great variety of articles which would be profitable for him to handle.

CHAS. C. JENKS,
Jackson, Mich.

In the accompanying engraving, we present portrait of the author of the now celebrated Linden Blossom Perfumery, though the perfume "Linden Blossom" was the joint conception of himself and his partner, Mr. Foote.

Mr. Jenks' taste for perfumery began as a child, and when at fourteen years of age, he entered a drug store as apprentice, his predilection manifested itself by his interest in aromatics, and his inclination toward the experiment in perfuming colognes and toilet waters and perfumed hair oils, which at that time were in high favor. Later, when he had completed his studies, he extracted emulsion to more general use as one of his chief perfume. Mr. Jenks was at once attracted by them, and gave the process of their preparation an exhaustive study and research.

This, coupled with practical experience in combination and mixing of the standard working formulas, resulted in the development of a new and delicate odor that was christened "Linden Blossom," which at once became the chief specialty of the house of Foote & Jenks. From the experimental table, other new and rare combinations were soon brought forward, until the list of F. & J. perfumes comprised all the leading odors popularly known, beside several special bouquets of exquisite fragrance.

Mr. Jenks attributes his success as a perfumer to the special gift of Providence in an extraordinarily acute sense of smell, which he has taken pains to care for and cultivate. For several years he traveled quite extensively, both in introducing the products of his house and visiting those institutions where perfumers' raw materials are prepared, so that by a more extended acquaintance and knowledge he might attain the highest perfection in his calling.

He is a constant student of essential oils, pomades, and other aromatic products, which combined with the chemical and botanical knowledge of himself and Mr. Foote, largely accounts for the ever increasing popularity of the products of this young house. They are practicing the motto: "Not low cheap, but low good!"

Mr. Jenks was born in Essex, near Ann Arbor, Mich., and received his first school instruction in that city.

Besides his other duties, he holds the office of secretary and treasurer for the corporation of Foote & Jenks.

"Economy in buying a brush is to buy the best that can be had, as a poor brush is one of the most useless articles that can be imagined. It not only costs the user the price paid for it, but loss of material upon which it has been used and a spoiled job generally." These remarks are taken from the catalogue of the Cincinnati Manufacturing Co., Cincinnati, O., and the idea is apparently not lost sight of in the manufacture of the goods which this firm puts upon the market. Their catalogue shows a very comprehensive line of brush goods and should be consulted by the trade before placing orders.

MAP OF THE UNITED STATES.

A large, handsome map of the United States, mounted, and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address, on receipt of fifteen cents in postage, by P. S. Eustis, Gen'l Pass. Agent, C. & Q. R. R., Chicago, Ill.

Amongst the large number of articles manufactured by the Herf & Frerichs Chemical Co., of St. Louis, the Iodine preparations take a foremost place. Their Iodide Potassium, Iodoform, Resublimed Iodine, and the various smaller preparations such as Iodides of Ammonium, Sodium, Lithium, Iron, Lead, Calcium, Mercury, etc., are so uniformly pure and reliable that they deserve the special attention of physicians and druggists.

A. S. Hinds, Portland, Me., has a special offer upon his Honey and Almond Cream, which every druggist should investigate. This preparation has a well-established reputation which makes it a good seller, but at the same time the proprietor is always ready to aid the druggist in extending its sale, by furnishing samples free of expense. Write for information regarding the special offer, and mention the Era.

Every person who has sore lips or chapped hands is on the look-out for something to relieve them. The druggist who keeps Witch Hazel Jelly is the one who is going to draw this class of trade and keep it. The mere mention of the fact that this preparation is a delightful one for use after shaving is sure to create a demand for it. It can be procured through your jobber, or of the manufacturers, Mayell-Hopp Co., Cleveland, Ohio.

Whenever you have a call for Cucumber and Elder Flower Cream, take care of it. Do not say you don't keep it, but tell your customer that you will get it. This preparation is manufactured by Mrs. Gervaise Graham, 1555 Michigan avenue, Chicago, and she will pay freight on the smallest order. Plenty of samples and advertising are furnished to help sell this preparation.

Those who have never tried the "D. & O." brand of oil of sandalwood should include with their next order to their wholesaler, an original four-ounce bottle. It is claimed to be stronger and better than any other, and is guaranteed to give satisfaction. All extensive buyers of essential oils, otto of roses, oleo-resins, pomades, powdered drugs, vanilla beans, etc., should make it a point to obtain prices from Dodge & Olcott, 86 and 88 William street, New York, before buying.

The Joel A. Connolly Plaster Co., of Boston, Mass., are willing to convince the drug trade as to the merits of their Croton Oil Plasters by sending one free for trial to any druggist who desires to test them. As the application of croton oil in a proper manner is an operation not always within the reach of the physician, the drug trade can to a great extent help matters by calling the attention of the medical profession to Connolly's Croton Oil Plasters. Write for full particulars and mention the Era.

It is no longer a question as to whether soda water is a paying side line for the druggist. That was settled long ago in the affirmative, and the question is now one of apparatus. The field for selection is so large that all tastes may be suited, and it should be thoroughly canvassed before a choice is made. "This is what the Robert M. Green Co., of Philadelphia, ask of every dealer who is interested in the soda water business. They will be glad to quote prices on both new and old apparatus upon application.

If you have not investigated the "Climax" removable glass syrup jars, manufactured by the John Matthews Apparatus Co., 449 First avenue, New York, you should send for description of this latest and greatest improvement in soda water apparatus. The catalogue of this firm for 1894 is ready for distribution, and will be sent free to all who are interested in the soda water improvements.

The Maltby & Wallace Co., of Champaign, Ill., have lately put upon the market a new trituration machine which consists of the application of mechanical power to the operation of the mortar and pestle. In these machines the mortars revolve and the pestles have a forward and backward motion, while a stationary scraper constantly throws the powder to the center of the mortar. All of the different motions are under the control of the operator, and one may be stopped without interfering with any other. The machines are arranged for either electric or steam power.

The W. Buedingen & Sons Co., of Rochester, N. Y., have lately moved into their new factory at 53 and 55 Platt, near State street. They now occupy a floor space of nearly 50,000 square feet, and their equipment consists of all the latest improved machinery for the manufacture of everything in the line of paper boxes, shipping tags, paper specialties, etc. They turn out everything from the cheapest to the finest, and are prepared to execute all orders, from the small job up to the large contract order. Send for new catalogue.

Neat, attractive packages are a great factor in bringing and keeping the best trade for the retail druggist. The use of bottle cartons, folding paper boxes, slide boxes, etc., is of course attended with expense, but the customer, as a rule, shows a willingness to stand the expense by going to the pharmacist who puts up his goods in the most attractive form. The Folding Paper Box Co., of South Bend, Ind., give special attention to this feature of the retail drug trade, and will be pleased to send samples and estimates on anything in the paper box line upon application.

Whittall, Tatum & Co., of Philadelphia, show something in this issue of the Era which ought to attract the attention of every druggist. The Phenix Herb Cans are an improvement upon the usual style of these containers. They are made of heavy tin, japanned a rich olive green color, with gold lines at top and bottom. The names instead of being painted on the cans are lithographed on strips of metal, and these labels are held in place by neat brass frames, which are detachable, thus allowing the contents of the cans to be changed at pleasure.

The Buckeye Paint & Varnish Co., of Toledo, Ohio, have an establishment equipped with the most approved machinery, managed by experienced workmen, which facts, coupled with a determination to use only the best raw material, and to place only the best goods upon the market, place them in a position to court the closest criticism and severest tests upon their products. Their "Buckeye" and "Corn City" brands of paints, varnishes, japans, wood fillers, etc., bear a favorable reputation, and they will be pleased to quote net prices upon application.

If you have a particular medicinal preparation which you desire to put upon the market in quantities, B. M. Butler, pharmaceutical chemist, Armitage avenue and North Paulina street, Chicago, asks you to correspond with him for estimates and prices. Mr. Butler is the proprietor of the laboratory previously owned by Morrissson, Plummer & Co., and has all the formulas formerly owned by that firm. An increase of facilities and the addition of new machinery places the new management in a position to solicit orders for anything in the line of pharmaceutical manufacturing, and guarantee perfect satisfaction both as to prices and products.

A bottle of perfumery which bears the name of Ed Pinaud carries with it a guarantee for all the requisites of a fine perfume. The new and exquisite perfumes recently put on the market by this house under the names "Aurora Tulip," "Paquita Lily," "Acacia de France," have all the characteristics which have distinguished the productions of the firm during the last seventy-five years, and those of the retail drug trade who desire to convince themselves of the quality of these goods will be furnished with free samples upon application to Ed Pinaud's importation office, 42 E. 14th street, New York City.

Spencer, Tioga Co., N. Y.

Dear Sir: In answer to yours would say that I have sold your Liquid Heave Cure for several years. It has given general satisfaction. In fact it has become a necessity with our livermen and all others who have used it.

Yours truly,

C. J. FISHER, Druggist.

TO THE TRADE.

We want every druggist to know that we are one of the largest wholesale distributors of Rye, Bourbon and Malt Whiskies in bond and tax paid, in this country. We can furnish Eastern and Western Ryes, Sour Mash and Sweet Mash Bourbon and Malt Whiskies. We can supply fine blended whisky under our own trade mark, as well as straight Ryes and Bourbons of our own bottling. We are agents for the product of Sen. Stanford's celebrated "Vina" ranch, whose wines and brandies are not excelled in this country.

We are headquarters for Alcohol and Cologne Spirits, which we supply at the lowest market quotations, and in addition to these staples we are agents for most of the celebrated cordials, such as Creme de Menthe, Kummel, Maraschino, and we carry in stock many others. A postal card from you will bring a printed list of the goods we carry, and we are pleased at all times to answer any inquiries from druggists regarding our goods.

THE WEIDEMAN CO.

33, 55, 57 and 59 Water st.,
Cleveland, Ohio.

You will never be sure that you have done the best possible in purchasing store furniture until you have got estimates from Charles P. Whittle, manufacturer of druggists' furniture, Boston, Mass. Send for catalogue, which may show you something you are in need of.

The Ash Soda Fountain Co., 207 South Canal street, Chicago, is a new firm which has lately engaged in the manufacture of all kinds of soda water apparatus for the drug trade. They have adopted the term "Superior" as a distinguishing appellation for their goods, and they ask the drug trade to obtain their prices and terms before purchasing.

As Four-Fold Liniment, manufactured by R. Matchett, Allegheny, Pa., is warranted as a speedy remedy in many diseases of horses and cattle, it is a quick seller wherever introduced. Address the proprietor for circulars and terms, and note list of jobbers from whom it may be obtained in advertisement in this issue of the Era.

"Stick 'Em" is an excellent name for fly paper, and the Stecher brand, bearing this name, is popular with the public because the term describes the characteristic features of the goods. It is claimed by the manufacturer, Henry W. Stecher, of Cleveland, O., that "Stick 'Em" is the largest paper upon the market, and therefore gives the best satisfaction. It is for sale by all jobbers.

The annual meeting of the Emerson Drug Co., Baltimore, was held January 8th, and the old officers of the company were re-elected as follows: Isaac E. Emerson, president; John F. Waggaman, vice-president; Joseph F. Hinds, secretary and treasurer. A dividend of 16 per cent on the capital stock of \$250,000 was declared. This speaks well for the selling qualities of "Bromo-Seltzer."

Billings, Clapp & Co., manufacturing chemists, of Boston, call particular attention to their advertisement in this issue to their bromide and iodide of potassium, and the salts of iron. This firm manufactures everything in the pharmaceutical line, and are sole proprietors of the well-known Nichols preparations. Their catalogue should be in the hands of every retail druggist.

The fact that E. T. Hazeltine, of Warren, Pa., is compelled to print each succeeding year, a larger edition of his unique pocket almanac, is evidence that they are popular with the public, and offer a good advertising medium for the retailer. If you have not received your supply for 1894, send in your business card without delay, that a supply may be printed before they are all gone.

Don't push patent medicines when you can buy reliable remedies from Irwin, Kirkland & Co., manufacturing pharmacists, Decatur, Ill., at one-half the price with your address on the labels and wrappers. They will add to your professional standing, and serve as an excellent advertisement in keeping your name and business before the public, and will hold trade and influence other customers to use your remedies.

Fred. N. Burt, of Buffalo, N. Y., is after the drug trade with some prices on druggists' boxes and labels which ought to receive attention. He claims to have set the standard for cheap boxes and can supply the trade with any quality or style from the coarsest to the finest, at proportionately low prices. Write for catalogue and prices.

PAPOID FOR DYSPEPSIA.—It. C. M. Page, M. D., contributes a paper to the New York Polyclinic on "Functional Dyspepsia, So-called." He divides functional dyspepsia into two varieties—irritative and atonic—in both the real pathological element to be dealt with being often a subacute or chronic gastro-intestinal catarrh. In the former class we find patients who are not infrequently robust and addicted to drink, glutinous habits, or the eating of highly seasoned food and the like. In the latter are found those who suffer with a general lowering of the vital powers.

But in either case there is a deficiency in quantity and quality of gastric juice, and an abnormal increase of alkaline mucus which gives rise to fermentation rather than digestion. The stomach becomes distended with gas, so that peristalsis is impaired and there is obstruction to absorption of the stomach contents. Moreover, the food becomes so enveloped in this alkaline mucus that the gastric juice fails to penetrate it and reach the food.

In the treatment of these cases, removing the cause and regulating the diet are of prime importance. As for removing the cause, this is often impossible in case the dyspepsia be associated with organic disease such as carcinoma, phthisis, and diseases of the liver, especially those that cause obstruction to the portal circulation.

But in irritable dyspepsia, dependent on alcoholism for instance, the cause can and should be removed. In the same way the opium habit must be dropped. Glutinous habits should be modified and the use of improper and highly seasoned food or food that is improperly cooked, be discontinued. In the atonic form, too, the cause can often be ascertained and modified, if not removed entirely. As such may be mentioned depressing emotions from loss of loved ones, financial ruin, the so-called disappointment in love, political aspirations and the like. Anything that lowers the vitality should always be looked for and treated, as menorrhagia, excessive sexual indulgence, overwork with insomnia, as well as lack of sufficient and wholesome occupation. In any case, meals should be regular, and the food eaten with deliberation instead of being swallowed hurriedly, especially while mentally worried about some scheme or other. In atonic dyspepsia, as a rule, tonic treatment is indicated and the patient has to be built up. But in irritable dyspepsia the very opposite course is often to be pursued, care being taken especially to avoid starchy and fried foods and fats, as well as alcohols.

Besides removing the cause and regulating the diet, many remedies have been suggested and tried by different practitioners from time to time. Of these remedies, papoid is one of the best. It dissolves the abnormal mucus secretions, thus removing a prime cause of fermentation, besides stripping the food of its mucous envelope and thus exposing it to the action of the gastric juice. In addition to its direct digestive action on the stomach's contents, it also seems to have a stimulating effect upon the gastric mucous membrane. Its therapy is not materially interfered with by any of the drugs usually given internally, and it is equally efficacious in acid, alkaline or neutral media. That it is not destroyed in the

stomach like animal pepsin, is proved by the fact that even in ordinary doses a trace of it may be found in the stools, thus showing that the whole gastro-intestinal tract has received the benefit of its action. In cases where diminished peristalsis is marked, accompanied by accumulations of gas in the stomach and bowels, it is well to add strychnia. The average dose of papoid is about one and a half to three grains ter die after meals, and one of the most convenient methods for its administration is in tablet form.

BAKING POWDER

In a paper read before the Georgia Pharmaceutical Society, George F. Payne gave results of his analyses of the leading powders on the market, and suggested the following formulas for the various types. The figures are based upon the tartaric acid selling by the ton at 25 cents a pound, cream of tartar at 23½ cents, acid phosphate of lime at 7½ cents, dried alum at 4½ cents, starch at 3½ cents, and bicarbonate of soda at 3½ cents. That these powders should keep well, each ingredient should be first thoroughly dried by a gentle heat, and they should be kept securely closed in dry fruit jars, corked bottles or sealed cans.

1. Tartaric acid..... 1 pound.
Bicarbonate of soda..... 1 pound.
Starch (powdered)..... ½ pound.
Costs about 11¾ cents a pound.
2. Cream of tartar..... 2 pounds.
Bicarbonate of soda..... 1 pound.
Starch (powdered)..... ¾ pound.
Costs about 13¾ cents a pound.
3. Acid phosphate of lime. 1½ pounds.
Bicarbonate of soda..... 1 pound.
Starch (powdered)..... 1½ pounds.
Costs about 4½ cents a pound.
4. Acid phosphate of lime. 2 pounds.
Dried ammonia alum..... 2 pounds.
Bicarbonate of soda..... 3 pounds.
Starch (powdered)..... 5 pounds.
Costs about 4 cents a pound.
5. Dried ammonia alum..... 1 pound.
Bicarbonate of soda..... 1 pound.
Starch (powdered)..... 1 pound.
Costs about 3½ cents a pound.

To the above cost should be added the cost of the containers and the time consumed in doing the work.

The ingredients, all finely powdered, should be first sifted separately, to get rid of all lumps, then the soda and starch should be well mixed together, and finally the acid ingredients should be added, and all thoroughly incorporated, either by rubbing together in a mortar or by sifting at least three times. Flour can be used in place of starch, and is considerably cheaper.

A recipe is given for each variety of baking powder. The amount of starch can be increased in any of the recipes, the other ingredients being left the same, and in this way be made at almost any price desired. The starch is simply used to keep the chemicals in a powder form from acting upon each other as much as possible, and, being cheap, is used very liberally in the low priced baking powders. Each recipe will produce a baking powder equal to the very best of its respective kind, if the very best chemicals are used. Adulteration is so common in cream of tartar that this chemical should be always carefully tested when purchased. First-class materials, of course, cannot be purchased in small lots at the figures given above.

DETECTION OF ADULTERATED LINSEED OIL.

At the annual meeting of the National Paint, Oil and Varnish Association held in November, the subject of adulterated linseed oil provoked considerable discussion. The P., O. and D. Review publishes a few of the adulterants and the manner in which they may be detected.

Linseed oil is liable to be adulterated in a variety of ways. Of foreign seed-oils, cotton and nigerseed oils are most used; mineral and rosin oils, often both together, are largely used; and rosin itself is also added.

The density of genuine raw linseed oil lies between 932 and 937, while that of the boiled oil varies from 939 to 950. Mineral and all foreign seed oils are lighter than linseed oil, while rosin and rosin oils are much heavier. By the judicious use of a suitable mixture of mineral and rosin oils, extensive adulteration can be effected without alteration of the density.

The solidifying point of pure raw linseed oil is about -27° C., but samples containing other seed oils solidify at a higher temperature. The same remark applies to the relative fusibility of the fatty acids, those prepared from cottonseed oil having an exceptionally high-melting point.

The iodine-absorption is a valuable test for, and method of determining the proportion of, a seed oil in linseed oil, provided that other adulterants are absent. Thus raw linseed oil assimilates from 155 to 160 per cent of iodine, while cottonseed oil takes up only 105 to 109 per cent. Certain fish oils absorb fully as much iodine as does linseed oil.

The rise of temperature on treating the oil with strong sulphuric acid is also a useful test for linseed oil, which gives more heat than any other seed oil; though it is equalled and even exceeded in this respect by some of the fish oils.

The sulphuric acid color test is a useful indication of the purity of linseed oil. With a genuine sample a dark-brown clot is formed; if rosin oil or fish oil be present a reddish-brown spot quickly forms, which in the former case retains its red tint for a long time, whilst a peculiar scum forms over it. This test is also applicable to the detection of rosin oil in boiled linseed oil, while the reaction is more rapid.

Fish oils may also be detected by the darkening produced by passing a rapid stream of chlorine through the oil, and by the reddish color produced by boiling the oil with an alcoholic solution of caustic soda. They are further recognizable by the taste and the smell of the sample on warming, and by the peculiar scum which rises when such oil is heated to boiling. As a test for cod oil which is not unfrequently used in the case of linseed oil intended for the preparation of printing ink. A. Morell recommends the following test: 10 grammes of the oil are agitated with 3 grammes of common nitric acid, and the whole left to stand. With pure linseed oil the color will change during the stirring to a sea-green color, afterwards becoming dirty green-yellow, whilst the acid assumes a light yellow color. In the presence of even 5 per cent of cod oil, after standing some time the oil is said to acquire a dark brown color, while the acid is tinged orange or dark yellow, according to the proportion of the adulterant present. A similar test has been described by A. Conrath for the detection of rosin oil.

WHITE LEADS OF COMMERCE.

L. J. Matos has endeavored to ascertain whether the white leads found in the American market are true to their claims as respects purity and excellence, and contributes some interesting results of his investigation to the Drug, Clrc. Five samples, which bore the labels of the manufacturers and their names and addresses, the firms all well-known to the trade as reliable, were found to be of the average percentage composition of about 10% to 12% per cent of oil, and 87% to 89% per cent of lead. With certain other samples, however, the results were not so satisfactory.

A certain so-called Superior White bearing the label of the Ajax Color Company, showed 12.29 per cent oil, 50.42 per cent zinc oxide and 37.28 per cent barytes.

American Standard Pure White Paint gave 10.55 per cent oil, 37.16 per cent lead, 52.17 per cent zinc.

Excelsior White Lead, 18.87 per cent, 37.45 per cent lead, 42.60 per cent zinc.

Blessing's Improved White Lead, 10.54 per cent oil, 71.28 per cent zinc, 17.90 per cent lead.

Household White Lead, a brand which appears not to be manufactured by anyone, showed oil 16.53 per cent, zinc 72.94 per cent, lead 2.41 per cent, barytes 8.09 per cent.

U. S. Standard White, 14.24 per cent oil, 57.56 per cent lead, 28.07 per cent zinc.

Imperial White, which appears to be put up by the same parties as the preceding, shows 13.08 per cent oil, 28.72 per cent lead, 26.19 per cent zinc, 32.02 per cent barytes.

The writer argues that it is poor policy for anyone to purchase paints which do not bear the names of their makers, for no reputable manufacturer can afford to put out inferior goods, such as these, under his own brand. The druggist is advised to be discriminating in his selection of paints and to sell only goods which bear the name of a reliable maker.

THE OLDEST TREE now extant is probably the baobab (*Adinsonia digitata*), of Africa, alias the sour gourd or cream of tartar tree (*Andinsonia Gregorii*), of Australia. This remarkable tree has a rather short and branching trunk not more than sixty or seventy feet high, while its girth at the ground is from eighty-five to ninety-five feet. One of them has names cut upon it which date back to the fourteenth century, and the naturalist Addison, who gave the genus its botanic name, calculated from certain data that its age must be upwards of 5,000 years. The hollow trunk of these trees, which are capacious enough to hold comfortably thirty or forty bodies, are used as tombs by the native Africans, where the suspended corpses soon become thoroughly mummified and preserved.

In a series of curious experiments at Naples, Italy, it has been found that the salts of lithium have the effect of producing monstrosities in the eggs of some marine creatures. From eggs treated with such salts young are hatched that have limbs in all sorts of abnormal places, being formed, apparently, from cells that do not produce limbs at all under normal conditions. It is supposed that the cells of the embryo exercise a selective absorption on the salt, some taking it up more readily than others, and that this causes the abnormal growth.

DRUGS FROM BURMAH. A. Sutherland recently entertained the members of the British Pharmaceutical Society with a description of the free and easy way in which business is carried on in an Oriental bazaar. From an account of his talk which *Phar. Jour.* prints, it is seen there is an entire absence of any restrictions on the sale of poisonous drugs, which are freely scattered among the harmless herbs and even ordinary articles of food. After exhibiting and describing a large number of the commoner drugs of vegetable origin which he had collected from the bazaars, the speaker gave a description of the character and uses of the more important ones and drew attention to the extensive prevalence of the doctrine of signatures. The specimens included a sample of star anise as generally sold in the bazaars, which on examination was found to be a mixture of the fruits of *Illicium anisatum* and *I. religiosum*; the pitch of *Aralia papyrifera*, used in the making of so-called Chinese rice paper, and a set of pictures illustrating the manufacture painted on sheets of *Aralia* or rice paper; a specimen of black *Aconitum ferox* root, a variety said to be steeped in cow's urine, giving it a strong and persistent hyraceum-like odor, used for poisoning tigers, probably the *Teliya* *Bachnag* of Oriental writers; and specimens of red, white and black seeds of *Abrus precatorius*, the white variety being used as a standard of weight by the Burmese.

Mr. Sutherland said the opium question in Burmah resembled the drink question at home. The sale of opium was a government monopoly and a source of considerable revenue. One marked difference was that an opium eater or smoker, unlike a liquor drinker, never got violently intoxicated, and never disturbed his neighbors or assaulted his relatives. He was usually stowed away in some obscure corner until he recovered. One therefore never saw much, or indeed any of it in the streets or any public place. There was no doubt, however, that it was a degrading practice, and was so regarded by the people themselves. The chief way in which the degradation revealed itself was in the form of petty thefts. The person who had acquired a taste for opium would do anything to procure it, and after recovering from a debauch, would steal anything he could lay hands on to get a few coins to purchase a further supply. This was about the only way in which the opium devotee annoyed his friends and neighbors. So far as he could judge, the use of the drug appeared to be on the increase. He believed opium was used largely by some tribes, especially in India, as a preventive of malarial fever, and apparently without injurious effects.

It is expected that the manufacturers of the United States will be handsomely represented at the World's Fair to open at Antwerp, Belgium, on May 5, 1894. A corporation called "The American Propaganda" will put up an elaborate structure of steel, iron and glass, to contain the American exhibit which, in addition to those of individual exhibitors, will include an "American Pliaisance," showing the salient features of our commercial methods by means of models of our shop arrangements and various business facilities, illustrated by a model telegraph office, post-office, printing office, telephone exchange, fire station, bank, barber shop, and a model American drug-store.

PALM KERNEL OIL.—The nuts are deprived of their external pulp, or old nuts picked up from under the palm trees are placed in the sun for days and even months, until they are perfectly dry. They are then broken between two stones and the kernels obtained whole or in perfect condition, and fit for exportation, and so form the commercial palm kernels. If they have not been perfectly dried the kernels break into pieces. The oil obtained from these kernels by the following process is called white kernel oil. They are put into wooden mortars and pounded very finely, then removed to a grinding stone and ground into a homogeneous mass, which is put into cold water and stirred with the hand. The oil rises in white lumps to the surface of the water; this is collected and boiled. It is of a very light straw color, and when exposed to the sun and dew becomes, after a time, perfectly white.

Brown or blast oil is thus obtained: The kernels are put into a pan and fried; the oil oozes out and is strained, the fried nuts are placed into wooden mortars, pounded, and afterwards finely ground on a grinding stone. The mass is thrown into a small quantity of boiling water and stirred continually; the oil rises and is gradually removed until it ceases to rise. The pulpy mass is removed from the fire and spread out in a large bowl and allowed to get cool, after which it is again ground and put by until the cool of the day, when it is mixed with a little water to soften it. It is now beaten with the hand for some time until the oil comes out in white pellets. As soon as this is observed a large quantity of water is put into it, and the oil, as a fatty substance, floats on the top, which is skimmed off and boiled, and the pure oil obtained.

PURIFYING AIR BY CHARCOAL.—Chas. Toope, who has taken a prominent part in the attempts to abate the smoke and fog nuisance in England, suggests the application of charcoal for purifying the air of the houses located in infected districts—all air admitted to be passed through thin canvas bags containing crushed charcoal. He holds that were such precautions taken, many regions now fatal to Europeans could be dwelt in with impunity. Mr. Toope is by no means the first to call attention to the remarkable absorbent properties of charcoal. Forty years ago the chemist Stenhouse described and illustrated the capabilities of charcoal as an absorbent and oxidizer of the products of decomposition of organic matter. He tells how the carcasses of dogs were kept covered with a thin layer of powdered charcoal—but otherwise exposed—without any nuisance arising therefrom. He adds that he has devised a respirator on this principle, to be used in districts smitten with cholera or yellow fever. He found, further, that with such a respirator he could breathe with impunity air containing large amounts of ammonia, sulphuretted hydrogen and other hurtful gasses. Stenhouse goes on to show how charcoal can be "platinized," or combined with minutely divided platinum. Charcoal containing even 2 per cent of platinum causes a mixture of oxygen and hydrogen to combine perfectly in about a quarter of an hour, and this strength of platinized charcoal is stated to be well adapted for charcoal disinfectant respirators.

THE SANITARIAN'S OPINION OF MECCA WATER. Here is an interesting little bit from the Ch. and Dr. report of a recent meeting of the Chemical Society. Mr. Mitchell read a paper on a sample of Mecca water brought by Sir Ilchard Burton from Ilagar's Well, forty years ago, when he made the pilgrimage to Mecca. Two circular tin flasks were filled by the explorer at that time and they have been in the possession of Lady Burton ever since. It seems from Mr. Mitchell's remarks that the supply of water in the well is becoming scanty, so the care-takers of it pour the water over the pilgrims, allowing as much as possible to drip back again. What the natural water may be, it is, therefore, difficult to say, but, as it is, sewage is an appropriate name for it. Mr. Mitchell found it to contain 219 grains of solids per gallon, 71.4 grains of free and combined ammonia per million, and 19.9 grains of nitrate and nitrates.

SOLID PETROLEUM BRICKS are a form of fuel which promises to come into active use. Sci. Am. describes the manner of their formation as reported in a French publication: One litre of petroleum is mixed with 10 per cent of resin, 150 grams of powdered soap, and 333 grams caustic soda and the whole heated and stirred at the same time. After about 10 minutes solidification begins, and the operation must be carefully watched. If there is a tendency to remain liquid, a little more soda is added, the mixture is then stirred until the mass is nearly solid, when it is poured into molds, which are placed for ten or fifteen minutes in a drying stove. One recommendation is the addition of 20 per cent of wood sawdust and 20 per cent of clay or sand. It is claimed that these bricks furnish about three times as much heat as the same amount of coal, and their special advantages are the absence of smoke, and a large reduction of bulk of fuel as compared with coal, while the risks attaching to the carrying of liquid fuel are avoided.

OXALIC ACID AS THE PLANT'S PROTECTOR. A very interesting statement from a German periodical is going the rounds to the effect that the role of oxalic acid in plant life is that of a protective agent, the writer taking exception to some of the theories which heretofore have had credence. The acid taste serves to protect plants from the ravages of animals, the same as do mechanical protective organs, such as spines, needles and hairs, and, in other instances, as some point out, offensive odors and the like. As the chemical protector of underground parts, the author calls attention to tannin, and very often tannin is found present in the young shoots above ground before the oxalic acid has put in an appearance. He notes that oxalic acid is commonly found in larger quantities in smooth plants, whose appearance is more attractive to animals.

An English contemporary, in commenting upon the refusal of the English courts to allow the registration of a certain word (Somatose) as a trade mark, expresses some surprise that the authorities should permit such a registration in this country. It appears that the procedure in patent and trade mark cases in the United States is very nearly in direct op-

position to the practice in England. In this country the patent office is not supposed to determine the right to the use of a trade mark except in certain defined instances wherein words in common use, such as geographical names, etc., are not subject to registration, and the right to use a trade mark is founded simply upon priority of appropriation. In our patent office, however, a patent is only granted after a thorough examination for possible infringement. It appears that they do things differently in England in the matter of patents, as is shown by the following from the Photographic Times: "Writing of patents, we cannot help thinking what a kind, benevolent institution the English patent office is. You have only to draw out a specification for an apparatus by which you intend sailing to the moon and back, and with the utmost consideration they will relieve you of your cash and grant you a beautiful patent, all signed and sealed, or you can take out a patent for making an eye in a needle to thread it by, and get it; whether it is of any value or not is left to your judgment, and if any oppose you, you are quietly left to fight it out by yourself, and so assist in enriching the government's coffers and the attorney's and counsel's pockets."

Shortage of mint crops and extended uses of the drug, are the causes of the present active demand for menthol. It is stated that the supply was never so inadequate to the requirements of trade, and that advices as to the Japanese supply are far from encouraging. Menthol has experienced such a fluctuation in prices during the last ten years that a further advance will act as an unpleasant reminder of old times. In 1884 menthol was sold at prices ranging from \$12 to \$15 per pound, but gradually declined, reaching its lowest quotation, \$1.50, in 1888. Since the latter date it has experienced a steady advance until now manufacturers' quotations are very near the \$5 mark.

The Retail Druggists' Fire Insurance Association of Ohio held their annual meeting at the office of John Weyer, Cincinnati, January 10, and elected the following board of directors for the ensuing year: L. C. Hopp, Cleveland; Phil Lehr, Cleveland; John Byrne, Columbus; M. A. Burkhardt, Dayton; C. T. P. Fennel, Cincinnati; John Weyer, Cincinnati; F. T. Bower, Toledo. These organized and chose M. A. Burkhardt president; John Weyer, secretary; C. T. P. Fennel, treasurer. The operations of the association are confined only to the State of Ohio, and none but retail druggists can become members. The annual report shows that during the past year the losses were only 8 per cent of the total premiums received, the members getting the benefit of a large rebate. It was also shown that most of the losses occurred in small towns. The company has risks to the amount of almost \$1,000,000.

Lynn & Barnes, of Paulding, Ohio, whose place of business was recently destroyed by fire, have built a new store and have awarded the contract for fixtures to John Phillips & Co., of Detroit, Mich. These fixtures are to be of quartered oak, and will include all the latest designs and improvements for which the work of this firm is noted.

THE MARKETS.

New York, January 25, 1894.

A decided movement in jobbing circles is reported and the markets show considerable improvement. The volume of business is fully up to the average, and in some instances trade is said to be better than it was at the same time last year. While the demands are for jobbing parcels, wants are frequent and prices are well maintained. There has been a number of committee meetings of the N. W. D. A. held recently, and as a consequence a number of well-known wholesalers from out of town have been visitors to the city. The drug trade section of the Board of Trade, at their annual election of officers, elected the following gentlemen for the ensuing year: Chairman, Thomas F. Main; vice-chairman, John W. Peters; secretary, Wm. J. Schieffelin; treasurer, W. D. Faris. Considerable excitement has been caused among the dealers in asafoetida over the rejection of three lots of gum consigned to well-known houses here. It seems an odd clause in the law has been raked up, which directs the rejection of gum going through the custom house not containing a certain average of pure gum; this has been revived, and the three lots reported are the first to fall under the rule. An appeal will be taken from the decision, and the drug trade section of the Board of Trade will also take it up at its next meeting.

OPIMUM—Shows an improvement both in price and business. Inquiries for case lots have been frequent and a number of lots have changed hands at varying prices; the jobbing price for single cases at present writing ranges from \$2.35 to \$2.50.

POWDERED OPIMUM—Has also been advanced. There are yet a few sellers at \$3.15, but the nominal market price is \$3.25 to \$3.35.

MORPHINE SULPHATE—Is in usual demand. American, in ounces, \$2.25; foreign, \$2.10.

QUININE SULPHATE—Continues in good demand. Manufacturers report business good, values are on a firm basis, and buying has been stimulated by the general belief that an advance will soon take place. There has been no material change in prices. Foreign, 22½ to 23¢; American, 23½ to 25¢ in bulk.

ALCOHOL—Is dull and featureless; prices made ten weeks ago still rule, and buying is for actual necessities only. Prices quoted are \$2.24 to \$2.28, with the usual 10-bbl discount.

WOOD ALCOHOL—The demand continues good, and at the low prices now prevailing some buying ahead is indulged in; previous prices quoted still rule.

ERGOT—Remains quiet. The situation abroad is reported firm. Indications show an advancing tendency for both Spanish and German. No change in prices is reported as yet for this market.

CACAO BUTTER—Is in light supply, and the small quantity on hand is held for full prices. Reports of supplies to arrive serve to keep prices between 35 and 40 cents.

BLEACHING POWDER, English—Continues scarce and prices rule high; 3 to 4½¢ is asked, with German at 2½ to 3¢.

OXALIC ACID—The demand for immediate delivery has increased somewhat, and wants are readily filled at market quotations, 8 to 9¢.

SAL SODA—Is in better demand and inquiries for spot goods are numerous. The number of arrivals has caused the market to take a somewhat easier tone.

CHLORATE OF POTASH—Is maintained in steady position with a slight improvement in demand. Prices remain without change.

SAL AMMONIAC, White—Has advanced. Advices from abroad quote the market as very firm; 8 to 9¢ in casks is asked, although there may be a few who are yet willing to shade prices.

BORAX—Business continues good, without change of prices.

BLUE VITRIOL—The market is well maintained. Prices steady at 4 to 4½¢ in casks.

NITRATE OF SODA—Stocks on hand are very light and dealers are holding firm on prices, quoting ½¢ to ¾¢ in wholesale jobbing quantities.

COPPERAS—Inquiries for spring delivery have begun to appear, but even in the face of dull business there seems an unwillingness to make concessions in price. Jobbing quantities are offered at 80 to 85 cents.

CITRIC ACID—Remains quiet and nothing seems to be offered below manufacturers' prices. Barrels quoted 43½¢, kegs 44¢.

COCAINE—Continues high. Muriate is quoted in ounces at \$5.05 to \$5.35.

MENTHOL—Continues high and scarce. Holders make no concessions in price and buyers are holding off, waiting for a decline. Values continue to range from \$5.50 to \$8, as to brand and quantity.

CAFFEINE, and its Salts—Remain at advanced prices, without change.

ARSENIC, White—Is scarce and high. The demand for small parcels continues, but buyers seem unwilling to pay advanced prices and trade is somewhat retarded; 4 to 6¢, as to quality and quantity, are ruling prices.

ALUM—The market is well maintained and no supplies are offered at less figures than \$1.80 to \$1.85 for lump and \$1.55 to \$1.95 for ground, in bulk packages.

CREAM OF TARTAR—Continues quiet with only fair business. Prices previously quoted are without change.

BRIMSTONE—Is in fair demand. In view of the light stocks on hand prices have slightly advanced.

QUICKSILVER—Is in moderate demand at 46 to 50¢, as to quantity.

CORROSIVE SUBLIMATE, Blue Mass, Calomel, Red Precipitate and Nitrate of Silver remain without change at previously quoted prices.

TARTARIC ACID—The market is unsteady, and the reported arrival of supplies here has caused prices to decline a shade. Crystals are offered 24 to 26¢; powdered, 25 to 28¢.

CASTOR OIL—Has increased in demand. Orders and inquiries from jobbers are numerous; prices are without change and previous quotations still rule.

COD LIVER OIL—Values for prime qualities are firm, as the supply of these grades is said to be getting light. Prices range from \$21.50 to \$24 per barrel.

MANNA—Appears easy. In view of the high prices reported from abroad only an ordinary business is being done. Prices remain at 85 to 90¢ for large flake; small flake, 36 to 40¢.

CASTLE SOAP—The supply of well-known brands seems to be limited, and firm prices prevail; 10½ to 12½¢ is asked for white and 6 to 8¢ for mottled.

GLYCERINE—Is without change. Values are a shade easier, owing to active competition. Barrels, 13 to 16¢; cases, 16 to 20¢.

BALSAM COPAIBA—A satisfactory business is being done. Wants of the jobbers are more numerous, and the market indicates a firmer tone. Central America, 37 to 45¢; Angostura, 60 to 70¢; Para, 50 to 58¢.

BALSAM FIR—Light stocks continue to act as an important factor in prices. Values continue steady at advanced prices, and no sales below market rates are noted. Prices continue at \$4 in barrels.

BALSAM PERU—Is selling well at slightly advanced prices. The non-arrival of expected stocks has served to stiffen prices, which range from \$1.70 to \$1.78 for 28 to 112-lb cases.

BALSAM TOLU—Is firm and light stocks of the best grades are reported. Prices are well maintained and very little outside stocks are offered; 30 to 35¢ are ruling prices.

GUM ASAFOETIDA—Best grades are very scarce and high. Prices for goods of this sort seem to be eagerly accepted at holders' figures, and very little prime is offered. Sales reported are few and a heavy advance is expected in view of the government's action. Prime is quoted at 35 to 45¢; ordinary, 25 to 35¢.

GUM CHICLE—Is without special features of interest. Prices range from 35 to 40 cents.

GUM BENZOIN—Is in firm demand at advanced prices. Fancy grades sell at \$2 to \$2.50; best vanilla, 90 to 95¢; powdered, \$1.05 to \$1.15; Sumatra, from 38 to 80¢, as to quality.

GUM CAMPHOR—Is dull and without interest. Prices remain without change at 45¢ in barrels, 46¢ in cases.

OIL CASSIA—Is firm. Advices from abroad show a firm condition of the market, and prices here have advanced; 90¢ to \$1.05 seem to be inside figures.

OIL CUBEB—Is dull and depressed. Prices quoted range from \$1.70 to \$1.85.

OIL ANISE—Has advanced. Values here are firmer. Star is quoted at \$1.50 to \$1.65; Russian, \$3.75 to \$4 for 5-lb bottles.

OIL PEPPERMINT—Continues dull and no business of importance has been transacted. Holders seem inclined to wait for advanced prices, which are expected to come with the spring demand. Western, \$3 to \$3.25; D. & O. in 20-lb cases, \$2.85 to \$3.

OIL BAY—Is in usual demand at fair values; \$3 to \$6 per lb, as to brand and quality, is quoted.

OIL ROSE—Is steady, without change in prices. Best, in 1, 2, 4 and 8-oz bottles, \$9 to \$9.50.

TONKA BEANS—Are firmer, and the price of prime Angostura has been advanced, while Para shows a slight decline. Angostura quoted \$2 to \$2.25; Para, 40 to 60¢.

VANILLA BEANS—Have improved in demand. Prices remain without change.

SARSAPARILLA, Mexican—Is slightly easier and only a small business is being done. Mexican is quoted in jobbing quantities at 12 to 14 cents.

LOVAGE ROOT—Is in good demand at 38 to 40¢.

RHUBARB—Shows considerable activity in a jobbing way. Orders for all varieties in cuts and whole root are numerous. Prices for first quality cubes, about 150 pieces to the pound, range from 70¢ to

\$1.80; slabs, round-trimmed, 85 pieces to the pound, \$1.10 to \$1.80.

CARAWAY SEED—Is firm. Prices have advanced owing to reports from abroad of a very firm tone of the market. Prices quoted here range from 7 to 9 cents.

ANISE SEED—Is in fair demand. Values range from 10½ to 12½¢, as to quality.

Opium is firmer owing to cable advices telling of severe frosts in the opium growing districts. This report materially strengthened the market, and on the day the news was received considerable business was done. "Assafoetida is higher," says W. H. Raser, "as the result of a recent decision of customs appraisers, refusing to pass an inferior lot of London gum, and in future will refuse to admit any gum not up to pharmacopoeia standard. As fully three-fourths of the available supply in London and elsewhere is said to be exceedingly poor, the higher grades will necessarily command more money, while those in this market who have stocks of inferior London grades have advanced."

W. H. Bowdler & Co., Boston, quote Beeswax, crude, in original packages, large lots, 25 to 27 cents per pound. W. H. B., refined, 30 cents, white 40 cents. Carnuba Wax, No. 1, 25 cents, No. 3, 18 cents. Ozokerite, 7 cents and upwards.

PATENTS,

TRADE-MARKS AND DESIGNS.

From U. S. Patent Office Gazette.

TRADE MARKS.

- 23,765—Extracts for Making Ginger Ale.—Hiram W. Weeks, Philadelphia, Pa. The fac-simile signature "H. W. Weeks."
- 23,766—Flavoring Syrups and Carbonated and Effervescing Beverages.—William Guilford, Glasgow, Scotland. The word "Burmo."
- 23,772—Anodyne and Antifebrile Preparations.—The G. F. Harvey Company, Saratoga Springs, N. Y. The word "Ricklein."
- 23,773—Antiseptics.—John De Christmas Dirckinck De Holmfeld, Paris, France. The word "Phenosalyli."
- 23,774—Medical Compounds for the Treatment of Nervous Diseases.—Empire Cure Company, Jersey City, N. J. The words "Empire Cure."
- 23,775—Remedy for Corns, Warts, Bunches and Callouses. Francis M. Criswell, Washington, D. C. The representation of a crow.
- 23,776—Cotton-seed Oils for Mechanical and for Food Purposes.—The American Cotton Oil Company, New York, N. Y. A representation of an eagle with outstretched wings resting upon a globe and grasping branches of the cotton plant.
- 23,794—Tonic Compound.—The Purdue Frederick Company, New York, N. Y. The name "John F. Gray."
- 23,795—Liniment and Remedies for Diseases of the Blood, Skin, Lungs and Throat.—Herbert E. Goodrich, Yankton, S. D.—The word "Aztec" upon the representation of a square bottle.
- 23,796—Medical Compounds for the Treatment of Nervous Diseases.—Empire Cure Company, Jersey City, N. J. The representation of an Imperial crown.
- 23,797—Remedies for Rheumatism, Gout, Neuralgia, Sciatica, and Kindred Ailments.—Butler and Claridge, Washing-

ton, D. C. The representation of a hand holding between the thumb and index finger a bottle at an angle, with its mouth up and with a series of drops dripping from said mouth.

- 23,798—Remedy for Nervous Disorders.—Drew Benedict Allen, New York, N. Y. The word "Antilliq."
- 23,799—Preparation for the Skin Consisting of a Cream-Like Ointment.—Frederick H. Muller, Chicago, Ill. The word "Kirkaskia."
- 23,800—Emollient for the Skin.—Shirey & Brown, Buena Vista, Va. The words "Arnica Cream," within parallel lines obliquely placed.
- 23,821—Certain Named Remedies.—Edward M. Beals, New York, N. Y. The words "Sultan's Secret."
- 23,822—Certain named Remedies.—Francis Patrick Cummings, Pocomah, Va. The words "Cummings Blood Cure" and a monogram of the letters "C B C."
- 23,823—Pharmaceutical or Dietetical Compounds.—Farbentfabriken vormals Fr. Bayer & Co., Elberfeld, Germany. The word "Somatose."
- 23,824—Pills, Plasters, Lozenges and a Remedy for Coughs.—Bernhard A. Hertsch, Philadelphia, Pa. The word "Plixto."
- 23,825—Plasters, Liniments, Ointments, Medicated Candy, and Remedies for Coughs, Cholera and Headache. Wilkins & Beckner, Greenfield, Ind. The word "Acme" with a monogram of the letters "W" and "B."
- 23,826—Liniments.—Christian Protexer, Chicago, Ill. The words "Dr. Ira J. Haskins' What Is It?" and the bust portrait of Dr. Ira J. Haskins.
- 23,827—Suppositories.—R. E. Harris & Co., San Angelo, Tex. The representation of a suppository with the symbol "Rx 1492" stamped on the base thereof.
- 23,834—Natural Mineral Water.—William J. Williams, Waukesha, Wis. The word "Ellm" together with the representation of an owl and the medical sign "R."
- 23,844—Perfumed Articles for the Toilet that are Consumed in Use.—Victor Klotz, Paris, France, and New York, N. Y. The words "Paquita Lily."
- 23,845—Soaps, Powders, Lotions, Dentifrice and Other Perfumed Preparations for the Toilet.—Victor Klotz, Paris, France, and New York, N. Y. The representation of an oblong figure having a rustic border, and bearing a circular band with the words "Ed Plnaud, Paris," upon it and enclosing a basket of flowers.
- 23,846—Corn and Bunion Cure.—Nicholas Manufacturing Company, New York, N. Y. The word "Corncracker."
- 23,847—Cough Drops.—George D. Feidt, Philadelphia, Pa. The representation of a frog with the numeral "3" and the letters "F F F" appearing or printed on its back.
- 23,848—Remedies for Coughs, Colds and Throat Affections.—William B. Shaw, North Attleborough, Mass. The words "Dr. Burden's Formula."
- 23,849—Liniment.—Goodrich & Jennings, Anoka, Minn. The words "Hoff's German."
- 23,850—Anti-Cholera and Tonic Remedy.—Maria Branca Scala, Milan, Italy. The fac-simile signature, "Fratelli Branca Co."
- 23,851—Certain Named Remedies.—Henry W. Beecher, Winsted, Conn. The words

"Brown's Anodyne and Family Medicine," arranged as shown, to-wit: with the word "Anodyne" displayed the most prominently and ranking in substantially a diagonal line on a scroll-like ground, and the word "Brown's" and the words "And Family Medicine" appearing respectively above and below the word "Anodyne."

- 23,861—Substance for Exterminating Rats, Toaches and Like Animals and Insects.—Charles William Manwaring, Chicago, Ill. The word "Knockemstiff."
- 23,873—Mineral Water, Ginger Ale, Phosphate, Ozonate and Carbonated Beverages. White Rock Mineral Spring Company, Waukesha, Wis. The representation of a woman kneeling upon a rock at the mouth of a cave and looking into the water below.
- 23,875—Insecticide.—Stephen Mueller, La Crosse, Wis. The word "Bugicide."
- 23,876—Fluid Compound for Female Disorders.—John L. Lyon, New Haven, Conn. The words "French Periodical Drops."
- 23,877—Anti-Cholera and Tonic Remedy.—Marin Branca Scala, Milan, Italy.
- 23,878—Liniment.—John M. Englehart, Somerset, Ky. The words "Englehart's Rheumatic Liniment" arranged within the parallel lines of a double triangle.
- 23,882—Hair Tonics.—Leon Pierre Federemeyer, Chicago, Ill. A monogram composed of the letters "F & B."
- 23,883—Oil of Roses.—George Luaders, New York, N. Y. The word "Carlova."
- 23,885—Castor Oil.—The Baker Castor Oil Company, Jersey City, N. J., and New York, N. Y. The word "Crystal."
- 23,887—Preparation for the Hair.—Robert Shoemaker & Co., Philadelphia, Pa. The word "Peruvian."
- 23,898—Anti-Cholera and Tonic Remedy.—Maria Branca Scala, Milan, Italy. A label having a background formed of oval loops inclosing the words "Fernet Branca, Fernet, Branca" in one color.
- 23,899—Anti-Cholera and Tonic Remedy.—Maria Branca Scala, Milan, Italy. The compound word "Fernet-Branca."
- 23,900—Medicine for Coughs, Colds, Bronchitis and Kindred Diseases.—The Shawnee Remedy Company, Toledo, O. The letter "E" superposed on three-sprays of golden-rod with the number "1001" directly below it.
- 23,901—Veterinary Medicine for Distemper and Cough.—Albert A. Wells and George R. Craft, Lafayette, Ind. The representation of a trefoil or three-leaf clover, having thereon pictorial representations of a horse's head, a sheep's head and a dog's head.

In experiments on the power of cholera bacilli to withstand cold, a culture estimated to contain 1,433,000 bacilli was submitted to five days' uninterrupted freezing, which killed them all. When the freezing was interrupted some of them lived six and even seven days, but it is thought safe to assert that no cholera bacillus can develop after it has remained in ice eight days.

On an appeal against the decision of the collector at the port of New York in assessing 50 per cent ad valorem on cachous made of extract of licorice, sugar and flour upon a classification as a toilet preparation, the board of appraisers ruled against the claim of the importers, J. C. Drucklieb & Co., that a rate of five and a half cents per pound for extract of licorice should apply.

W. SIMON.

PROF. W. SIMON is a native of Germany, his birth occurring February 2, 1844, in Eberstadt, Hessen, his father being a clergyman of the Lutheran church. The youth received his early education at the college in Glussen and in his 17th year entered a drug store. Three years apprenticeship was followed by a successful examination which entitles the candidate to act as assistant pharmacist and as such he served during the next two years in different parts of Switzerland. In 1866 he commenced university studies at Glussen, two years later passing the State's Examination as pharmacist, and on December 4, 1869, graduating as doctor of philosophy.

Professor Simon was a participant in the German-French war of 1870 when he served as chief of a sanitary corps. Near the close of that year he came to Balti-

more, where he had accepted a position to take charge of the chemical part of the manufacture carried on by the Baltimore Chrome Works. In this service he virtually revolutionized the methods for the production of potassium bichromate, and the processes by which the article is now manufactured were invented and patented by him. When he reached Baltimore he found that in that city there was no place where analytical chemistry was taught practically, and upon request from a number of gentlemen, mostly physicians and pharmacists of long standing, he instituted a course in analytical chemistry, the venture proving a flattering success. The following year he was appointed professor of analytical chemistry in the Maryland College of Pharmacy, which was the first pharmaceutical institution in this country to make analytical chem-

istry an obligatory branch of study. In 1872 he received appointment to the chair of general chemistry in this institution and a few years later took the added duties of a professorship in the College of Physicians and Surgeons. For the past three years he has filled, too, the chair of chemistry in the Baltimore College of Dental Surgery, which is the oldest dental school in the world. He is the author of a Manual of Chemistry, the first edition of which appeared in 1884, a second edition was exhausted in two years and a third in less than twelve months.

He was president of the Maryland State Pharmaceutical Association in 1889, and at the Norfolk meeting of the A. P. A. was elected chairman of its section on Education and Legislation. He is a member and honorary member of numerous societies.

ENTERED AT THE DETROIT OFFICE SECOND-CLASS MATTER

ESTABLISHED 1897.

THE PHARMACEUTICAL ERA.

SEMI-MONTHLY.

Issued on the 1st and 15th of Each Month.

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.For Subscription and Advertising Rates see
advertising page 30.

EDITORIAL.

REVISED PRICES CURRENT.

The Prices Current, which has long been a feature of the Era, has been revised and materially enlarged. The list embraces those articles in the drug stock which are subject to frequent market fluctuations, besides the standards which suffer little variation. New remedies are fully enumerated, and paints, oils and glass are not omitted. It is believed this list is now of very practical and serviceable character. It receives semi-monthly revision, and is kept fully abreast of the market.

THE GOVERNMENT'S CHEMICAL WORK.

The paper by Dr. Wiley in this issue is a noteworthy one. It describes the extent and value of the service rendered to economics in this country by the government's bureau of agriculture through its Chemical Division. The general public has but a dim comprehension of the nature of this service, for did it have such knowledge, it would appreciate its value in the highest degree. The paper is written in a simple conversational style which is a model in its way, and in comprehensiveness and quality of information it is particularly excellent. The public has been a little inclined to belittle the work of the Agricultural Department, but what it has done for the farmer in the way of imparting information regarding soils and crops and the most remunerative methods for working up the latter is having its effect in the betterment of conditions under which this class of the community labor. The paper is commended to the general reader as well as to those who are specially interested in the subject it concerns.

LAW FOR YOU; NOT FOR ME.

Is life less valuable to the dweller in a small town than to one in a city? Kentucky legislators seem to think it is, for they have decided not to extend to the former the protection the latter enjoys under the provisions of the pharmacy act. A bill requiring druggists in towns of less than one thousand inhabitants to qualify themselves the same as those in larger municipalities, by securing certificates, was defeated. This result is said to be due in large measure to the fact that the physicians of Louisville and other cities requested that the existing law be let alone, and perhaps, too, because country people did not wish to surrender the convenience afforded by the country storekeeper who sells drugs, and the wishes of this class of constituents was not to be disregarded. The Kentucky countryman must remain in jeopardy from inexperienced and incompetent druggists. The pharmacy laws of nearly all the states make exceptions in favor of the patent medicine vender and so-called domestic medicines; in Kentucky

true pharmacy is made the exception, and can be followed only in the larger towns and cities.

OBSERVE THE LIQUOR LAW.

A large number of Chicago druggists were arrested early this month for violation of the regulations governing the sale of liquors. There is no particularly new feature in the case, and the excuses and explanations offered by the druggists are of the old stock character. The matter, looked at from a news standpoint, is detailed in our news department. Here its other aspects must be considered.

How and why should there be arrests for offenses of the nature charged? It is a lamentable fact that observance of excise restrictions by druggists is not thorough and complete. No excuse should be accepted for violation of laws they have promised to uphold. The temporizing policy followed by so many cannot be too strongly condemned. The law may be burdensome, unjust, but, being the law, offenders should be punished for its infraction. It would be a good thing if a few of the arch sinners were made examples of, and we say this not from ill motives, but in the honest belief that the drug business and professional pharmacy would benefit therefrom. Among the arrested druggists are some of the best known and most respected of the profession, one a member of the state board of pharmacy, and we submit, whether they be guilty or innocent, is it not deplorable, a slur upon the profession, that such things are and can be? We would warn the druggists who were not arrested to live up to the law, register every sale of liquor for medicinal purposes, and absolutely refuse any liquor to be drunk on the premises.

THE NEW DISPENSATORIES.

It speaks well for the assiduity of the compilers and the business facilities of the publishers that the two great dispensatories, the United States and the National, are presented in completely revised form so soon after the appearance of the new Pharmacopoeia. The matter of choice between the two works is largely of opinion or prejudice merely; for, were merit alone to decide the question, it would be exceedingly difficult of determination. The text of both works is very comprehensive, and the treatment of the subject matter is fully abreast with the times. Either dispensatory is a complete commentary upon pharmacy of the present day, and an encyclopedia of information invaluable in practice and theory. Were we inclined to submit any criticisms, the gravest would be that the compilers of these works have given the equivalents in apothecaries' system for metric weights and measures. Of course a very large proportion of pharmacists will consider this a most valuable feature in the books, but, inasmuch as the Pharmacopoeia, the only official work, the guide for the profession, authorizes only the decimal or metric system, the adoption of this generally for practical service is delayed by the action of the compilers of the dispensatories. We are sorry to note this feature, for without it the pharmacist would be obliged to adopt the official system, or, at least, be compelled to make the proper transpositions from one method to the other, an operation which would very quickly familiar-

ize him with the official one. It is hard to understand why there has been any opposition to the metric system, particularly why pharmacists are so slow to familiarize themselves with it and use it in their daily practice. It can be mastered by very brief study and in convenience for manufacturing operations, pricing, etc., it is not to be excelled. On the whole, however, to use a stock phrase, American pharmacy can "point with pride" to its new Pharmacopoeia and its two great dispensatories, which have no equals in pharmaceutical literature of other countries.

EXAMINATION QUESTIONS.

It is very gratifying to us to find how general is the interest felt in the plan of publishing in this journal series of examination questions and replies. It has been but two weeks since the first series was presented, but already the replies are so numerous that any fears we may have entertained as to the extent of favor this feature would meet are proven groundless. They show very conclusively that there are many who desire to test their knowledge, and who find such questions efficient guides to study. One young man writes us, "I am one who has not yet had an opportunity to try the board examination and I think these questions will be a great help to me. It is to be hoped that those availing themselves of this opportunity may not stop when successful in passing an examination, but will continue increasing their professional knowledge by asking and answering the questions in these series. I find the proper way of pursuing the study is to write out the questions. When I first glanced at them I thought they could be readily answered, but when I began to write down the answers I found I had to refer to my books many times before I was through."

In this last sentence our correspondent gives expression to the principle upon which it is proposed to continue the publication of these examination questions. It is desired to print questions which will test the real knowledge of the student, rather than those which admit of answer by a mere reference to text books. In the main they involve some principle or basic idea, an understanding of which is necessary to correct answers. They are selected without particular regard to classification, that is, any series includes questions in the several branches related to pharmacy instead of being devoted to some particular subject. As a rule, a correct answer means putting into practical service knowledge possessed, or necessitating considerable search to elicit the principle or idea upon which the question is based. Thus, for instance, when the student is asked to perform a calculation to arrive at the volume of a liquid, specific gravity and other factors are involved. These questions are by no means intended to serve merely as aids to those desiring to pass board of pharmacy examinations, for though many of them may be considered typical of questions propounded by the boards, they are not identical with those of any particular body. Careful study of these questions will point out to the student the weak and the strong points in his educational armor and, using them as guides to study, he is enabled to test the strength and repair the weaknesses.

From the character of answers already received, it is gratifying to note the young men following pharmacy in this county are more widely qualified and better posted than some people have seen fit to believe. But on the other hand there are occasional answers which demonstrate that the institution of our boards of pharmacy was a very wise step to guard the profession against the entrance of incompetent exponents of the art and profession. We hope to receive increasing liberality of responses and are confident that this feature will exceed our most sanguine expectations in regard to practical service.

A RAILROAD PLAN FOR CUT RATES.

For an ability which is able to make the best of a situation which has been popularly denominated, "hard times," the managing powers of the various railways of the United States probably stand without a peer. Not only are they able to keep their bowls turned upward when the skies rain porridge but are able usually when necessity requires to create that peculiar meteorological condition which causes a precipitation of this much desired article of diet. It is quite true that much has been heard of the dire poverty which has lately afflicted our transportation companies and of their inability to pay dividends upon stock representing values which may possibly be approximated in nineteen hundred and something. The separation of several railroad presidents in affluent circumstances from their roads in non-affluent circumstances has been noted, and the sympathies of the people have gone out toward these institutions in a way that would shame the crocodile's simulation of grief.

Two serious obstacles have always stood in the way of satisfactory returns from railway operators. These are, a tendency to a lowering of rates, and a constantly increasing number of claims for damages to goods during transportation. It has remained for the wisdom of that impersonal body, the Central Traffic Association, to devise a plan to meet these difficulties. To accomplish this object, two rates have been made, the higher being charged upon goods for which the shipper desires the transportation company to assume the ordinary liability of a common carrier, and the lower rate where the shipper releases the carrier, or in the words of the release, "The shipper does hereby release and discharge, so far as he lawfully may, the said railroad company and all other railroad or transportation companies to which the said property may be delivered for transportation to or toward its place of destination, from all claims, demands or liabilities for any loss thereof or damage thereto howsoever occurring, by fire or otherwise, or whether by negligence of the said railroad or transportation companies or of their or either of their officers, agents or employes or otherwise, while the same is in their care, custody or possession."

The signing of such a release by the shipper forms the basis for a new form of bill of lading which contains, in addition to the above release, a clause making the document non-negotiable. The matter of rates is fixed by the announcement that "Property shipped not subject to uniform bill of lading conditions, will be charged one class higher than as herein provided and cost of marine insurance." To say that these new regulations are

obnoxious to every man who has occasion to ship goods by rail is putting the situation quite mildly. The choice is now offered of paying a higher price than formerly to have the transportation companies assume their "ordinary" liabilities as common carriers, or that of paying the old rate, releasing the goods, and praying that no "negligence" shall supervene before the delivery of the same at destination. As many of the commodities of the drug trade pay first-class rates, which are the rates usually charged upon the higher classes of goods, the effect of not releasing is quite a serious one from a financial point of view. As a rule the difference between the various classes of freight is but a few cents, and the class above first class is known in railroad language as once and a half first class, or double first class, as the case may be. For instance, a first class rate may be 30 cents, second class may be 40 cents, in which instance the change from a lower to a higher rate involves but 10 cents, but a moving upward from first class to the next step makes the rate \$1. The shipper is thus confronted with a prohibitive rate or the privilege of saying to a railroad company, "I will pay you for transporting these goods, and you can deliver them if circumstances and the peculiar state of negligence now existing upon your line will permit." That such a condition of affairs will be allowed to exist for any length of time is not to be believed. At a period when hard times and radical views as to corporations are very much to the front it is apparently a case of both optical and mental aberration on the part of railway managers to attempt such a palpable injustice. Several years ago an attempt was made to adopt a form of bill of lading which would be non-negotiable, but the storm of protests from shippers led to its abandonment. In the present instance commercial bodies are already bestirring themselves, the Chicago Freight Bureau, a powerful organization, representing local shippers, having decided at a recent meeting to carry the matter before the inter-state commerce commission for a ruling upon the release, and there is no doubt but that the various drug organizations are fully alive to the exigencies of the situation, and will make their influence felt at the proper moment.

Many prominent shippers have refused to sign releases upon the ground that goods belong to the consignee after delivery to a transportation company, and that a release by the shipper would render the latter liable for all damages. Several shippers have notified their customers that they decline to release goods unless specifically instructed to do so, and it is in such cases as these that the retailer is at a loss what to do as his competitor in the same line of goods may have all the advantages over him which a difference in rates would make. This new ruling also practically invalidates a bill of lading as far as its negotiable character is concerned, as no bank or business concern would care to advance money upon a document which expressly stipulates that the goods named therein may be used in a railway bon-fire, and that the owner has no grounds for recovery. The destructive character of railway transportation even when the carrier is made to assume full liability, is well known. What it would be when its "officers, agents or employes" understood that no penalty attached to negligence, is difficult to imagine. Meanwhile there is

a growing suspicion that the whole matter is in the nature of a great big bluff. The different sections of the release are modified by the expression "the said (shipper's name) does hereby release as far as he lawfully may," and it is believed that the words "lawfully may" are peculiarly significant in this case, and may be interpreted to mean that increased tolls will only be collected from people who do not "kick," or until legal complications arise to prevent such collection.

PHARMACEUTICAL EDUCATION IN ENGLAND.

The remarks of Mr. Martin on American pharmacy, recently published in these columns, have, as was to be expected, elicited considerable protest, and there is a desire on the part of American pharmacists for information concerning the regulations governing the practice of the profession in Great Britain and its colonies. In this number is a reply to some of the strictures in Mr. Martin's paper, but for purposes of comparison, it is necessary that the true condition of affairs on both sides of the Atlantic should be known. We know what legal qualifications are required here, but it seems necessary to consider the relative advantages and disadvantages of the two systems. From copies of legal acts and laws in force in Great Britain, and from information supplied by correspondents in England, the following brief summary gives a comprehensive idea of the English situation. We quote a portion of a recent letter from a London friend, who says: "Ireland and England are treated differently, there being distinct laws for each country. In Great Britain the major examination, giving the title pharmaceutical chemist, is optional, since it is not imposed as a qualification by the pharmacy act of 1868, which is the act that controls the sale of poisons. All that the act requires is that chemists and druggists shall pass the minor examination. This was the assistant's examination under the act of 1852, but since 1868 it has been advanced greatly in scope. The minor is strictly in two parts, viz: The Preliminary and the Minor Examination proper. There is no mention of the Preliminary examination in the act of 1868, but assistants, before that time, had to pass the Preliminary and the Minor Examinations, and this remains as the interpretation of the expression occurring in the act. This is a little confusing to any but a Britisher, still, thus it is, the Preliminary must first be passed." The Era will shortly publish a set of examination questions used in the Minor Examination.

Briefly, the following are the qualifications required of British pharmacists: First, he must pass the Preliminary Examination or its equivalent; second, he must have been engaged for three years in practical dispensing; third, he must pass the Minor Examination. The Minor Examination lasts two days.

On the first day every candidate has three hours of practical chemistry and three hours at dispensing and practical pharmacy. If he survive, he is called upon on a second day (at an interval of one to fourteen days) to be examined orally in the rest of the subjects. Written questions are not set. There are two Boards of Examiners, one for England and Wales, meeting in London, and one

for Scotland, meeting in Edinburgh. The examiners are pharmaceutical chemists, generally men known for original work, or as competent pharmacists, with some special knowledge in one or more departments. They are appointed by the Pharmaceutical Council of Great Britain, and their appointments must be approved by the Privy Council, which is a non-political body of the queen's advisers, consisting of parliamentarians, men of letters, science, etc. A representative of the Privy Council attends the examinations to insure that the standard is maintained for the safety of the public. All precautions are taken to maintain the integrity of the board and the standard of qualification. Though a curriculum of study is not compulsory, 90 per cent of the students do attend a school or college of pharmacy. With the exception of the Pharmaceutical Society's school, these are all private ventures. Only a small proportion of students attend evening classes, and six months at the day classes is the average period of study.

It will be seen, therefore, that it depends entirely upon the character of the Preliminary and Minor Examinations whether the British pharmacist be the superior of his American brother. This is a careful comparison of the questions employed by the examiners of England, and the Boards of Pharmacy of the United States alone can demonstrate. On the whole, we believe the questions propounded to the English candidate are a little stiffer than those in this country, particularly as regards a familiarity with Latin and French. It is easier in England to enforce a high standard than it is here, for the United States is an immense country, and conditions governing any business or profession vary within very wide limits, according to the section of country wherein practiced. As careful, reliable dispensers, we believe the American pharmacist has no superior; as a Latin scholar and an expert mathematician he is not always in very high rank, but so far as the safety of the public committed to his charge is concerned, he is as good a man as any other. It will be noticed that in England there is but one independent pharmaceutical school, all the others being, as stated, private ventures. How do these really differ from certain American colleges, which Mr. Martin mentioned as being conducted for the money that they make? It must be admitted that there is a great lack of uniformity in the courses of instruction offered by American colleges and in the character of the examinations conducted by the Boards of Pharmacy, but there is constant striving toward uniformity, and, even as it is, the druggist here has cause to congratulate himself that so high a level has already been attained. The question of what is the proper qualification for the practice of pharmacy is not to be settled by the say-so of one man, nor is the fact that one country has a different standard from another to be accepted as proof that it is the right standard.

CANADIANS WANT PROTECTION.

Not the protection of a McKinley or a Wilson tariff, but of the Canadian druggist against the druggist from the states. England always asserts that what she has and does in any line is better than that of any other country, and the United States is generally selected for purposes

of comparison. She has been shown by revolutionary wars, prize fights and yacht races that her opinions are not always well founded, but she is a stubborn old lady and "convinced against her will is of the same opinion still." She is particularly vehement when education is the topic for discussion, and above the babel of voices raised in strenuous protest, hers is heard monotonously reiterating "Mine is the best." It is not surprising then that her Canadian child has inherited some of the old lady's brag and bluster, and we find Ontario papers deploring the fact that druggists from New York State are allowed to carry on business in the province in competition with the "regularly diplomaed druggists" of the Canadian College of Pharmacy. It is asserted that the Canadian pharmacist is the superior of his New York brother in education and professional qualifications, that Canadian colleges of pharmacy are of far higher standard than those of the United States, and in short the United States druggist is of hardly good enough material to wipe one's shoes upon. To those who really know the relative merits of pharmacy colleges in these two countries this Canadian brag is very amusing, for in matters of pharmaceutical education she is neither fish, flesh nor fowl. We would not assert that Canadian colleges of pharmacy are inferior, but would deny their superiority in any particular to the best of those in the States. Some people have a suspicion that the New York druggists are a little too good to please the provincial, and that all this talk about faulty education, and low standard, and easy examinations in the States is to disguise the real reason for alarm. We would suggest to our Ontario friends that all trouble and "invidious comparisons" would be avoided if they would refuse, as is done in some of the states, to recognize any diploma or certificate whatsoever. Find out what a man knows, rather than believe his diploma's statement of what he knows. Druggists from New York State would not object to such a test undergone in company with the Canadian druggist.

PRACTICAL EXAMINATIONS BY BOARDS OF PHARMACY.

A practical test of a candidate's proficiency in compounding prescriptions is being enforced by some boards of pharmacy and is proving very satisfactory. Illinois and Minnesota have inaugurated this feature in a very complete way and it is bearing good fruit. There is great lack in this one particular in the scheme of examination in the various states, a defect repeatedly pointed out but difficult of correction. The test is one which alone will demonstrate whether the candidate be so generally and particularly posted as his written examination papers afford presumptive evidence he is. Processes, manipulations, principles may be fully described on paper, yet the writer prove sadly deficient when put to practical test. A Minnesota paper, after relating that of a class of 45 but 17 passed this practical examination, says:

"Some of the rejected work was very bad. In one case a test of 2-grain quinine powders showed that they actually weighed 8 grains. Some emulsions were more like puddings than the perfect article, and boxes of pills were like clay marbles."

Surely to require demonstration of fit-

ness in this direction is within the province and is the duty of the examining board, which must decide the registration or rejection of candidates for pharmacists' certificates. We believe every board of pharmacy should adopt such a requirement, but this cannot be done if a board holds its examinations in different cities throughout the state. The paraphernalia necessary cannot be transported from place to place, it must constitute the equipment of rooms specially fitted for the purpose. The reason the boards are peripatetic (if we may be allowed this use of the term) is to afford the most eligible opportunities to candidates in distant localities for assembling in accessible meeting places. But this reasoning is of little weight when considering the necessity for determining the applicant's real proficiency as a pharmacist. The leading colleges of pharmacy are recognizing the value of the instruction afforded in the dispensing laboratory, and all colleges and boards must adopt the system in order to best fulfill their functions. England heats us in this particular.

Since the metric system has been promulgated as official in the United States Pharmacopodia it may be useful to some of our readers to recall the fact that the U. S. fractional silver currency bears a little relation to its various units, a relation that has been made designedly and by law. The half dollar equals 12½ grams, the quarter dollar 6½ grams and the dime 2½ grams. Eighty half dollars are equal to 1 kilogram. You must have some money, though, to verify these statements.

A few of the particular features of the present issue to which we desire to direct attention are the comprehensive papers upon vaccination and vaccine virus, the manufacture of concentrated preparations for subsequent dilution, and advertising by retail druggists. Each of these treats of a subject which is closely related to a legitimate branch of the druggist's vocation, and will undoubtedly be received with appreciation.

In Germany the law requires a heavy license fee from a merchant engaged in any line of business before he can engage in another branch. Application of this principle in the United States would make it hard for the department stores, and thus in some measure prevent their inroads upon the drug trade in the way of cut-rate drug departments. Wouldn't it be a good thing were this rule existent here?

REMOVAL OF PAINT SPOTS.—Here are a few hints from Painting and Decorating. For light colored goods use ether alcohol or gasoline; the former, however, is always to be preferred. If the goods are dark and the paint has not had time to soak in the cloth much, take a piece of the same kind of cloth and rub over the paint spots briskly. The effectiveness of this rubbing cloth to cloth treatment will surprise and please the most incredulous. If the spots are dry and hard, ammonia and water is probably the most active and effective liquid that it is possible to use. But it is a terribly harsh preparation to use on cloth of delicate texture, and on goods of dyed color it would be unsafe to use it. Such cloth should be treated with alcohol or gasoline.

[Written for the Era.]

CHEMICAL DIVISION, U. S. DEPARTMENT OF AGRICULTURE.

By H. W. Wiley, Chief Chemist.

The work of the Chemical Division of the Department of Agriculture is not well understood even by the educated and reading public of the United States. The general idea of its function is, that it is to assay gold and silver ores for members of Congress and other high officials and to analyze mineral waters for the purpose of giving certificates to be used by the proprietors for advertising purposes. In fact, this last supposed function of the division is the one commonly accepted. It would be a surprise to persons not familiar with the facts to see the number of applications received by the Chemical Division for certificates to be used in advertising. Almost every variety of good and bad materials is represented in these requests. The makers and venders of baking powders, maple molasses, condiments, lards and other food products do not seem to realize the fact of the impropriety of any department of the government becoming a sponsor in any way for any of their goods. It is not because the article which it is desired to submit to the favorable notice of the public is not wholesome and nutritious that the department withholds its certificates, but because of the impropriety of giving to any particular person any advantage in the market over his competitors in the same line. It is true that the name of the department, and of its officials, has been used from time to time in advertisements, but in so far as the Chemical Division has been concerned it has always been done without the consent or knowledge of the division or its chief, and as soon as such uses have been discovered respectful protests have been filed and in one or two cases even stronger language has been used in order to cause the withdrawal of the name of the chief chemist from such advertisements.

First of all, let it be understood that it is not the object of the Chemical Division to make analyses for any commercial purposes whatever or to furnish any kind of certificate to be used for advertising purposes. Again, let it be understood that it is not the object or purpose of the Chemical Division to make examinations of minerals for the precious metals or for any purpose except for fertilizing materials, nor of mineral waters, nor of waters of any kind except for irrigation or other agricultural purposes, nor of clays with respect to their use in pottery, with the possible exception of the manufacture of agricultural drainage tiles.

Perhaps a broader statement would be of advantage to many persons who labor under the mistake of thinking that the Department of Agriculture, in its Chemical Division, was established for the purpose of making private analyses of any description. In the earlier days, before the establishment of the State agricultural experiment stations, it was the custom of the department to have analyses made of fertilizers, soils and agricultural products from different localities. Since the establishment of the agricultural experiment stations, and their endowment by direct grant of funds from Congress, it is the uniform custom of the department to refer all requests for such analyses to the respective State stations. It is easy to see that the small force of the Chemical Division would be totally

inadequate for the accomplishment of all the analytical work presented, even when that work is clearly and distinctly related to agricultural matters.

Properly stated, therefore, the Chemical Division of the Department of Agriculture has for its objects, first, research respecting agricultural chemical matters which are not well understood or which promise good for the future; in the second place, the investigation of the best methods of chemical analysis with a view to unifying methods and bringing the practice of this and foreign countries into harmony; third, the investigation of the possibilities of great agricultural industries, resting primarily on chemical research.

As an illustration of this third point may be given the work of the department in the last few years in investigating the possibility of establishing an indigenous sugar industry. This work primarily rests upon the acclimatization and development of sugar producing plants, on the nature and quality of the soil on which they are grown and the fertilizers which are employed in their growth. These researches, as is easily seen, rest largely upon chemical investigations and therefore these problems have been properly, I think, referred to the Chemical Division.

In the fourth place, the Chemical Division investigates subjects relating to the effect of the adulteration of foods upon public health and the profits and rights of the farmer. There is also a large class of miscellaneous work, not clearly defined and sometimes of a doubtful nature, which naturally falls to the work of the division.

From a pharmaceutical standpoint, perhaps the most interesting work of the Department of Agriculture is that which relates to the adulteration of foods. This work has been carried on in a systematic manner for seven or eight years. The principles upon which it rests are clearly outlined in Part I of Bulletin 13, relating to dairy products and their adulteration. In the preface to this work it was stated that the object of the work was "to determine the best methods of analysis of the various products in question, and all the recent improvements in analytical methods have been thoroughly tried, and those which have given good results have been used in the analytical work which has been done." This statement does not fully cover the scope of the work, for not only have investigations of the best methods for the examination of foods been made, not only with dairy products and with all the more common foods, but also all these methods are given in detail and the results of their work compared. In this way the bulletins on food adulteration not only become valuable aids to the pharmacist or physician and the public hygienist, but also provide for the chemist a more or less complete bibliography of all the analytical methods which are used in the examination of such products and to a certain extent a complete resume of all the literature affecting the subject from either an analytical or hygienic point of view.

Eight parts of Bulletin 13, comprising 1,167 printed pages, have been published and the remaining parts of the work, as outlined, will probably comprise four or five bulletins more, giving a work having a total number of from 1,600 to 1,800 pages. A typical number of the series is part 8, relating to the adulteration of canned

foods. In undertaking the study of canned and preserved foods it was the original intention to have the whole of the work included in one publication, forming one part of Bulletin 13. The magnitude of the work, however, was found so great as to compel a change in this plan and therefore the part of the investigation relating to canned vegetables was included in a separate publication, namely, part 8 of Bulletin 13. This bulletin has the greatest interest for pharmaceutical readers. It contains a complete bibliography of the subject of the introduction of copper and zinc into canned vegetables for the purpose of preserving their green color. The whole question of the contamination of goods preserved in cans with lead and tin tops is also thoroughly discussed. It is shown that in many of the tins used in this country more than 10 percent of lead is found and an alloy and vegetables preserved in such tins are certain to be more or less contaminated with lead.

The question of salicylic acid has also been thoroughly discussed, both in part 3, relating to fermented beverages, and in part 8, relating to canned vegetables. The literature referring to salicylic acid in foods is pretty thoroughly covered in these two bulletins. No dogmatic assumption of authority in regard to the hurtfulness of salicylic acid, or of copper, or of lead, is found in the bulletins, but the statement of evidence both in favor and against the use of these materials is given as fairly as possible. The author of a public bulletin has at least one advantage over almost any other writer; from the independent position which he occupies he is able to enter into a free and impartial discussion of the subject. The private author of scientific treatises is often interested particularly, and sometimes commercially, in the subject of which he writes and is therefore subject to more or less bias. Take, for instance, the discussion of the relations of oleomargarine to public health and to the fraud upon the producer of butter. The chemist who is employed by an oleomargarine factory would doubtless be biased in favor of giving to oleomargarine every advantage in the discussion; on the other hand, a chemist in the employment of a dairy company would take the other extreme; while the chemist writing as a government official, would be in a position to judge impartially in regard to the merits of these foods. This position renders the following paragraph, found on page 17 of part I of Bulletin 13, possible:

In regard to the wholesomeness of artificial butter or oleomargarine "there is a wide difference of opinion. It is undoubtedly true that a great deal of artificial butter has been thrown upon the market that has been carelessly made, and therefore harmful to the health. On the other hand a butter substitute, made carefully out of the fat of a perfectly healthy bullock or swine, is not prejudicial to health." Again, on page 24: "While it is true that chemical analysis and certain digestive experiments have not hitherto shown that pure butter possesses any marked superiority over butter substitutes as a food, yet it must not be forgotten that butter has a much more complex composition than lard or tallow or cotton seed oil; that it is a natural food, and doubtless possesses many digestive advantages which science has not yet been able to demonstrate."

It seems to me that the above quotations pretty well illustrate the true scientific attitude which should be taken on a subject of this kind. In the first place, it must be clearly admitted that first class oleomargarine or butterine, when properly made from healthy animals, cannot be considered as prejudicial to health. On the other hand, pure butter fat has advantages not possessed by its substitutes, and especially in the case of invalids and dyspeptics it doubtless has decided advantages which are not clearly demonstrable by chemical and digestive experiments.

In the results of the analysis of canned goods for copper an illustration of the work of the division in its relations to public health may be found. Opinions are divided in regard to the wholesomeness or unwholesomeness of added preservatives. The great weight of testimony, however, is to the effect that while these substances in small quantities are not injurious to health, yet the continual use of them even in such small quantities may become prejudicial. It is a fair conclusion from the data collated in part 8, Bulletin 13, that the use of added preservatives in canned vegetables is objectionable. This contention, however, is not strong enough to warrant the recommendation for an absolute inhibition of these bodies. The consumer would be sufficiently protected if the law should require that on each can of preserved vegetables or other foods a statement should be found as to the character of the preservative used and the amount of it which has been added. The consumer and his medical adviser are thus properly forewarned of the danger which they may encounter in the use of such foods, and if in the face of this announcement they see fit to continue the use of these goods, they cannot hold the guardians of public health responsible for any ill effects which may follow. The same conclusions which are drawn in regard to added preservatives can be stated respecting the use of copper and zinc for greening goods. The occasional use of a small quantity of a copper or zinc salt, it must be allowed, can be practiced without practical injury to health; on the other hand, the continual and regular consumption of even small quantities of these materials must be regarded as at least prejudicial. If the cans containing greened goods are properly labeled, then the responsibility of the use of these materials rests upon the consumer rather than upon the packer.

Interesting results in regard to the digestibility of canned goods were also obtained in the course of the investigation. A general review of the experiments made in artificial digestion leads to the conviction that the process of canning, especially where preservatives are employed, such as salicylic acid and sulphites, tends to diminish the digestibility of the albuminoid and allied bodies.

Strange to say, the attitude of the department in regard to these matters has been misunderstood by most of the packers in whose goods preservatives have been found. Almost without exception they have vehemently denied that any such preservatives are ever used in their factories. In all cases where such denial has been made in proper form to the department a re-examination of the samples has been made. In most cases portions of the sample having been preserved. In every case the original deduction from

the analysis has been sustained. In several cases, in fact, in all where a sufficient quantity of the material was still on hand, the packers have been asked to send a reputable chemist of their own selection to our laboratory and we have promised to allow him full facilities to make the investigation for himself. In no case has our offer been accepted. The attitude of packers towards the work of the department in this respect is strikingly portrayed in letters from them published in the Inter-State Grocer. The general conclusion of the packers is that the chemists were totally incompetent or moved wholly by prejudice, and that the discovery of salicylic acid in canned goods was purely a myth of the imagination and that the persons who made the discovery are totally unfit to occupy any official position. One packer writes: "We denounce the government analysis as unjust, false and damaging." Another says: "It is not true that salicylic acid was found in our asparagus, for the reason that we have never had the article or any other kind of preservative in our factory." A French packer writes: "I went round Bordeaux and saw some of our best packers and we had much fun about the knowledge of Dr. Wiley as a chemist, but no one thought it was worth an answer. You know perfectly well that salicylic acid is forbidden in France, but it is true that some packers use it in small quantities and run their chances. * * * As to myself, I consider all this a big 'humbug' and believe Mr. Wiley to be a pretty poor chemist in the matter, or a big drummer—whatever the situation that he occupies may be."

In several instances long affidavits have been filed to the effect that no preservatives of any kind, especially salicylic acid, have been used by the packers in whose goods they had been found. We make a uniform reply to communications of this kind, namely, that when it comes to believing the evidence of a chemical reaction or that of an affidavit, the chemist is compelled to choose the former.

The same kind of experience was had with the bulletin relating to the adulteration of honey. Forty-four per cent of the liquid honey which we purchased in the open market in the United States was found to be adulterated, mostly with glucose. In one instance where samples of honey bearing a certain label were found to be adulterated the packer denied emphatically that any adulterated honey had ever been used. Afterwards he admitted that he bought honey by the car load and when pressed for a description of his test for its purity replied that he relied wholly upon the taste, and that it was impossible for him to be deceived and that he could tell any honey with which a portion of glucose had been mixed. Evidently there must have been cases where the expert had failed to apply the test, as many samples bearing his brand were found to be adulterated. These matters have been mentioned not for the sake of complaining of the opinion of the packers, because we believe in nearly all cases they make the denial in perfect good faith, but it is possible that these adulterations may be practiced without the proprietors of the institution knowing anything about it. It is barely possible also that a person who would use these preservatives clandestinely and who practices these adultera-

tions, might not hesitate to publicly state that he never did any such thing. While the work of the Chemical Division in respect of its examinations of foods is of much more particular interest to those engaged in pharmaceutical pursuits, yet it by no means covers the whole or even a large part of the ground which is occupied by the activity of the division.

One of the most important works which has been accomplished by the Chemical Division has been in the way of the promotion of uniform methods of analysis of commercial fertilizers and agricultural products. The Chemical Division has done this indirectly by the relation which it has held to the Association of Official Agricultural Chemists of the United States. The Chemical Division has published the bulletins of this association for the past ten years and the association has formally recognized the fact that a large part of its usefulness has been secured by this co-operation between it and the Department of Agriculture. As an illustration of what has been accomplished in this direction, I may call attention to the proceedings of the tenth annual convention of the association, held at Chicago, August 24th, 25th and 26th, 1903. This is a bulletin containing 218 pages of printed matter, beside the introduction and Index, making nearly twenty pages more. It comprises the reports of the year on the comparative analyses of phosphoric acid, of potash, of soils, of dairy products, of feeding stuffs, of fermented liquors, and of sugars, molasses and honeys. First of all comes, in each case, the statement of the reporter on his particular subject. These reporters are appointed the year before and are charged with certain duties by the association, especially with the preparation and distribution of samples to chemists who are willing to take part in the comparative work. They receive the results of these analyses, collate them, compare them and get them in form for presentation to the association. They call especial attention to defects in methods of analysis and propose what in their opinion should be the proper amendments to be adopted. Then follow papers on the theme presented by the reporter and discussions thereof. Finally, the association adopts what, in its wisdom, seems to be the best of the amendments offered and formulates a scheme for the guidance of official agricultural chemists during the coming year. The result of the work of this association has proved of incalculable benefit to the chemists of the United States and all parts of the world. Our methods have become standards not only in this country, but in many parts of Europe. One of the objects of the Association is to obtain co-operation from other countries in securing uniform methods of analysis and an international congress on this subject has been called to meet in Brussels in August, 1904.

As another illustration of the work of the division let me call attention to what has been done in the promotion of the culture of sugar producing plants in the United States. Under the charge of this division, experimental stations have been established at Sterling and Medicine Lodge, Kansas, for the scientific culture of sorghum and the study of the best methods of making sugar therefrom. As an illustration of the magnitude of the work accomplished in such stations I

call attention to the fact that nearly 150,000 analyses have been made during the past two years. These analyses consist not only in the determination of the percentage of sugar by the polariscope but also in many cases of the determination of the reducing sugars and the solids not sucrose. Another experiment station, in charge of this division, has been established at Schuyler, Nebraska, for the purpose of studying the best methods of improving the sugar beet. The best and most approved forms of agriculture are practiced, the beets are grown under perfect control and subjected to frequent and thorough analytical studies. The best of the beets are preserved in silos for the production of seed. During the spring each of the beets which it is proposed to grow for seed is subjected to analysis, a diagonal core of pulp being removed from the beet for that purpose. This does not destroy the germinating power of the beet. The analysis of the pulp permits a classification of the beets into three grades. Those, for instance, which contain the highest amount of sugar, say, above 18 per cent, form the first grade; those containing from 15 to 18 per cent the second grade, and those containing from 12 to 15 per cent the third grade. All beets showing less than 12 per cent of sugar are rejected. The number of analyses made at this station during the past two years was about 40,000.

Another station, under the charge of the Chemical Division, has been established at Runnymede, in the center of the Florida peninsula, for the purpose of investigating the possibilities of the growth of sugar cane in that region, together with studies of cassava and tobacco as collateral pursuits. This station has only recently been established and very few analyses have been made in connection with its operation.

The miscellaneous determinations, which it is impossible to classify in a brief article of this kind, probably amount to 2,000 or 3,000 analyses per year. In the matter of nitrogen alone 3,000 to 5,000 combustions are made each year. No detailed record is kept of each individual determination, but taking into consideration the work of the experiment stations above mentioned, and the work in the laboratory itself, it is safe to say that not less than 100,000 different analyses are accomplished during each year by this division. The usual number of chemists employed at the home laboratory is from twelve to fifteen, but during periods of special activity, as in the case of the sugar analyses mentioned above, large additional numbers of chemists are employed temporarily.

At the present time the division is engaged chiefly in the analysis of all the samples of California wines which were exhibited at the Chicago Exposition. This is supplementary to the extensive analyses of the beers and ales which were made of exhibits at the same place. These are also parts of the work of the Chemical Division which will prove of interest to pharmaceutical readers.

I have endeavored to comply briefly with the request of the editor for this review of the scope of the work accomplished by the Chemical Division. I am deeply conscious of the impossibility of properly presenting a full idea of this work in so brief a space, but I trust I have accomplished something in this line.

[Written for the Era.]

THE ECONOMY AND CONVENIENCE OF PREPARING IN CONCENTRATED FORM FOR SUBSEQUENT DILUTION SOME OF THE EXTENSIVELY USED U. S. P. PREPARATIONS.

By, F. J. Wulling.

Pharmacists doing a fair or large business need to make, either very frequently or in very large quantities, the preparations for which there is a large demand. If very frequently much time is spent, a small quantity requiring nearly as much time and labor for preparation as a large one does; large amounts require the investment of more capital for the greater quantity of material used, which in the case of the tinctures or spirits containing much alcohol is of considerable importance. Making, say in summer when it goes well, 4 gallons of tincture ginger at one time to last the season, will involve an expenditure of more than ten dollars for alcohol before there is any return. Making four times one gallon during the season as required incurs less expenditure of money at one time, but a greater expenditure of time and labor in the aggregate. The latter method requires less capital to do the same amount of business, but more time and labor, and these usually offset the pecuniary advantage. Now the real economy is in combining, where it is possible, the advantages of the two methods, and this may be done in many cases by making the preparation several times stronger in active ingredient and diluting with the proper solvent or menstruum as needed. Instead of making one gallon of a twenty per cent tincture of ginger, one gallon of an eighty per cent one may be made with no greater expenditure of time and work. The latter will contain as much ginger or require as much as do four gallons of the twenty per cent preparation, which of course necessitates a greater expense for the drug at one time, but this is more than offset by the saving involved in not needing the other three gallons of alcohol until there is a demand for the tincture. In other words, the time intervening between the buying and selling of three gallons of the tincture out of four is reduced to a minimum. This is one of the secrets of business success, to have the least possible amount invested and to turn that over quickly.

Some of the preparations of the U. S. P., a goodly number, it is not expedient to have in concentrated form, either because their limited use does not warrant it, or because the nature of the preparations or some of their ingredients do not permit of it. In the writer's experience the method has been found expedient and economical in many cases, and it is the purpose of this paper to give some of the instances in which it is applicable.

It is perhaps best to give formulae adjusted to the U. S. P., 1890, which have been in use in the writer's laboratory.

TINCTURE ARNICA FLOWERS.

Arnica flowers in 20 powder 800 Gm.
Diluted alcohol enough to percolate 1,000 Cc.

Label product distinctly; "Concentrated Tincture Arnica Flowers, 80 per cent." "To make U. S. P. tincture, mix 1 part with 3 parts by measure of diluted alcohol."

COMPOUND TINCTURE OF CARDAMOM.

Cardamom 80 Gm.
Cassia cinnamon 80 Gm.
Caraway 40 Gm.
Cochineal 20 Gm.
Glycerin 200Cc.
Diluted alcohol to percolate 1,000 Cc.

Label: "Comp. Tinct. Cardamom, Quadruple Strength." "To make U. S. P. Tincture, mix one part with 3 parts by measure of diluted alcohol."

COMPOUND TINCTURE OF CINCHONA.

Red cinchona 400 Gm.
Bitter orange peel 320 Gm.
Serpentaria 80 Gm.
Glycerin 800 Cc.
Alcohol 1,700 Cc.
Water 150 Cc.

Mix half the glycerin with the alcohol and water, and percolate until 2,000 Cc. of product are obtained, adding alcohol and water in above proportions as long as necessary, and remainder of glycerin last. Label: "Comp. Tincture of Cinchona, Double Strength." "To make U. S. P. tincture add one part to one part of a mixture of 850 alcohol and 75 water by measure." It is not expedient to make this more than double strength.

COMPOUND TINCTURE OF GENTIAN.

Gentian 400 Gm.
Bitter orange peel 160 Gm.
Cardamom 40 Gm.
Alcohol, 3 parts by measure.

Water, 2 parts by measure, enough to percolate 1,000 Cc.

Label: "Comp. Tincture Gentian, Quadruple Strength." "To make U. S. P. tincture, add one part to three parts of a mixture of three parts alcohol and two parts water, all by measure."

TINCTURE OF RHUBARB.

Rhubarb 400 Gm.
Cardamom 80 Gm.
Glycerin 200 Cc.
Alcohol, 5 parts by measure.

Water, 2 parts by measure, enough to percolate 1,000 Cc.

Label: "Tincture Rhubarb, Quadruple Strength." "To make U. S. P. tincture, add one part to three parts of a mixture of alcohol 20, water 8 and glycerin 2 parts by measure." In the above the proportion of alcohol is very slightly greater than in the U. S. P., this being necessary to prevent at times the deposition of chrysophanic acid.

TINCTURE OF GINGER.

Ginger 800 Gm.
Alcohol, enough to percolate 1,000 Cc.

Label: "Tinct. Ginger, Quadruple Strength." "To make U. S. P. tincture, add one part to six parts of alcohol by measure."

CAMPHOR LINIMENT.

Camphor 400 Gm.
Cotton seed oil 600 Gm.
Label: "Camphor Liniment, Double Strength." "To make U. S. P. liniment, add one part to one part by weight of cotton seed oil."

SPIRIT OF PEPPERMINT.

Oil of peppermint 400 Cc.
Peppermint, bruised 40 Gm.
Alcohol, enough to make 1,000 Cc.
Label: "Spirit Peppermint, Quadruple Strength." "To make U. S. P. spirit,

add one part by measure to three parts by measure of alcohol."

SPIRIT OF LEMON.

Oil of lemon, 300 Cc.
Lemon peel, 200 Gm.
Deodorized alcohol, enough
to make 1,000 Cc.

Label: "Spirit of Lemon, Quadruple Strength." "To make U. S. P. spirit, add one part by measure to three parts by measure of deodorized alcohol."

SYRUP OF WILD CHERRY.

Wild cherry, In No. 20
powder 300 Gm.
Sugar 700 Gm.
Glycerin 150 Cc.
Water, enough to make, 1,000 Cc.
Label: "Syrup Wild Cherry, Double Strength." "To make U. S. P. syrup, add one part to one part of simple syrup, both by measure."

In making these concentrated preparations the directions of the Pharmacopœia should be followed. There are probably other preparations which might profitably be made in this manner—the above have been found by trial and experience to be, in their finished state, in no wise different from those made in the usual way, the color, strength, stability, etc., being the same. The method is not applicable in making Syrup Ipecac or Syrup of Tolu. The objection is that unless carefully labeled the concentrated form of the preparation may inadvertently be dispensed for the diluted. To obviate any such error the concentrated preparations may be grouped and a special shelf assigned them in the stock room, or cellar. They should be distinctly labeled, and in a manner, perhaps, as follows:

Tincture Ginger,

QUADRUPLE STRENGTH.

To make U. S. P. Tinct. add ONE part to THREE parts ALCOHOL by measure.

Some may possibly object to this method of preparing the above tinctures because a menstrum which will exhaust a drug in the preparation of a tincture will not always wholly extract the proximate principles of a drug in the preparation of a fluid extract. In preparing the above tinctures this fact was had in mind. It was found that the extractive in the concentrated tincture and in the tincture made from the latter was exactly or closely approximate to that in the tincture prepared in the usual way. The majority of a number of physicians consulted stated as their opinions that the difference, if any, in the therapeutic action of a tincture and fluid extract made from the same drug in proportionate doses was so slight (irrespective of the stimulating action of the alcohol present in larger proportions in the tincture), as to have escaped their notice. The others declared confidently that there is no difference. Several physicians, after having tried the above tinctures, sanctioned their use in their prescriptions. In the process of percolation properly conducted, a menstrum is supposed to exhaust a drug until all the menstrum, is saturated, or until all the soluble principles of the drug are extracted. All, or nearly all, of the official fluid extracts are not saturated, hence the drug is exhausted at a point when the menstrum is still capable of taking up more soluble matter. Of course it requires more skill to make a fluid extract than it does to prepare a tincture.

It is a question not yet decided whether a menstrum retains its solvent powers for all of the proximate principles of drugs as it increases in saturation. This question and that of the expediency or otherwise of making tinctures from fluid extracts is now in process of investigation by the writer, and will form the subject of a subsequent paper.

VACCINE VIRUS.*

By H. M. Alexander.

Nearly a century has elapsed since Dr. Edward Jenner, the discoverer of vaccine virus, inoculated his first patient, and proved to the world the efficacy of his theory of vaccination, as the preventive of that dreaded disease, small-pox. As has always been the fate of every new theory, invention or innovation in its infancy, vaccine virus met, for a time, with violent opposition, yet the learned Jenner lived to be feted in the streets of London, his path strewn with flowers, and he was finally tendered a testimonial of ten thousand pounds, by an act of Parliament, in recognition of the great boon he gave to mankind. But important discoveries are slow of adoption, and owing to bigotry and superstition, are seldom appreciated fully in the age of the discoverer. The evolution of vaccine virus was then necessarily slow. Great difficulty was experienced in procuring vaccine from the animal, and the use of the crust, taken from one person and applied to another, which is known as humanized virus, or vaccine, was adopted. This method was continued for many years, when it was discovered that a great number of diseases, especially skin diseases, and the most vulgar ones to which the human system is heir, were being conveyed from arm to arm.

We shall pass over the history of the period which elapsed from the beginning of the nineteenth century until the propagation was begun in America in 1870, for the history of this period, as we glean it from the writings of many authorities, is very conflicting. The efficacy of the virus as a protective agent was thoroughly proven in many instances, while there were others that left some doubts as to its ability to protect against the dread disease, small-pox. Our own experience has forced us to believe that these great difficulties in protective power were largely due to the fact that humanized virus was much used, which in these cases of failure had greatly degenerated.

Sources of American Propagation.—Whether true cow-pox was found among the cattle frequently prior to 1866 is not certain, but in that year a case was found at Beaugency, France, and it was from this strain that bovine virus was imported into America, and its propagation from heifer to heifer introduced into the United States in 1870, by the late Dr. Henry A. Martin. In the decade which followed, the propagation of vaccine virus was begun in various sections of the country. The methods employed, however, were of the crudest nature, and much of the propagation of a dangerous character. In many instances, propagation is still carried on in unclean stables, located in filthy city alleys, where the virus produced is of necessity subjected to dangerous contamination from the surrounding filth; the cattle are usually procured from city stock yards;

heifers, generally, but frequently decrepit old cows that have shown some organic weakness. Only an external examination of them can be made, and naturally disease bearing tuberculosis is not always avoided. As a result, the greater portion of the virus procured in this way, instead of affording protection against small-pox, merely produces ulcers of a dangerous and most painful nature. Dr. Martin discovered a case of cow-pox at Cohasset, Mass., in 1880, but being sensitive to unjust criticism, he did not continue its propagation as a separate strain. In 1885 a case was accidentally discovered in Eastern Pennsylvania, and investigated at the time by Dr. Wm. Welch, Professors L. E. Sayre and F. E. Stuart, of Philadelphia, Mr. C. A. Jeltnish, and Drs. Itoland and Musser, of Lancaster. This is the source of the greater portion of the bovine virus now being produced. The question of cow-pox being small-pox in the cow or a distinct disease, must pass by for want of time.

Location of Vaccine Establishments.—It is important that an establishment for the propagation of bovine virus should be located in the open country, where the advantages of pure air and perfect cleanliness are possible, and where every possible sanitary condition can be had. The buildings should be erected especially for, and devoted exclusively to, the propagation of bovine vaccine virus. They should be models of perfection and cleanliness. Ample room should be given, that no crowding of cattle be called for, while the water supply should be well filtered, and absolutely under the control of the propagator. The operating should not be done in the stables, but should be in a spacious room, well ventilated, free from filth of every description, and perfectly dry, for dampness is an avowed enemy of vaccine virus. The stables wherein the cattle are housed should be clean, pure and entirely free from foul or impure air.

The Proper Selection and Preparation of the Cattle.—Instead of buying cheap, diseased or decrepit cattle from city stock yards, the better plan is to rent heifers from one to two years of age, being reared by the farmers of the surrounding country for their future milkers. This enables us to use generations of the same stock, and therefore know all about them, giving the advantage of learning of the existence of any hereditary diseases that might naturally be overlooked in the most careful examination of the animal itself. When the heifers are brought to the farm, the first thing is to give them a close examination, then place them in the stables, groom carefully and feed on bran mashes, until it is determined they are ready to become subjects. They should then be led to the operating room and fastened. The method of this fastening differs greatly, but the one I employ has proven by far the most satisfactory. By a simple mechanical arrangement, the animals are easily turned over, resting on the strong portions of the ribs, near the vertebral column. They rest easily on the upholstered tables and do not struggle, while all is done in a manner which preserves them from excitement. The inner portion of the flanks, back and above the udder, are then well shaven, and inoculated with vaccine taken from a former subject. This portion of the body is selected, as it is the easiest to be kept clean, and does not chafe. In some establishments the udder is select-

*Read at the regular meeting of the Philadelphia College of Pharmacy and contributed to the Era for publication.

ed, but experiments have conclusively proven that the ilder is too warm a location, and usually results in confluence and malignancy. The abdomen, which is also sometimes selected, offers the same objection, as the animal cannot lie down to rest without lying on some of the vesicles and developing excessive heat. After the inoculation, the heifers are taken to specially prepared stalls, where they are cared for and closely watched for an average of seven days and nights. When the vesicles are fully developed, the animals are returned to the operating room, the crusts are then removed with the handle of a scalpel, and the vesicles are thoroughly cleansed by sponging, and all foreign and impure matter removed.

Preparing the Points.—The Ivory points which are to receive the lymph which is now exuding from the vesicles should be sterilized. They should then be placed in clamps of fifty each, so that the operator is not obliged to touch the points with his fingers. The points are coated with a camel's hair brush with which the operator absorbs the virus as it exudes from the vesicles. The points are coated twice with the virus of two animals. The vesicles should not be irritated by the repeated application of the point to the surface, as is the case in most establishments, and which causes them to exude much serum, while the repeated handling of each point causes great danger in the way of septic poisoning. Besides this, when fifty points in one of these clamps are coated with one and the same brushful of virus from one animal, and recoated with another brushful from another animal, they will all be alike, which is not the case if the vesicle is irritated by a repeated application of hundreds of points to the tender surface. They should be carefully inspected, packed in glass, and bear the label of the propagator. Unscrupulous propagators do not, as a rule, label their goods, but conceal their identity, which should always be a good reason for discarding them.

Selling the Points.—Rate cutting and the great clamor of the cheap druggists, or the demands of sharp competition, have caused Ivory points coated with muclage to be placed upon the market at a very low figure, thus driving the real article out for a time. These knives, then finding that the total failure of their goods gave them much trouble, and that the druggist returned to the legitimate ones, added to their muclage croton oil, which causes a vesicle to form. The patient tells the physician that his arm is sore, and he, accepting the statement, believes the virus to have been all right, while the fact that it acts so quickly proves its worthlessness.

Cause of Failures.—This brings us to the cause of failures being reported, not only where there have been actual failures, but where the physicians have failed to wait long enough before making their reports. Not only do failures certainly result from the use of impure materials, but also occasionally from those of good source. Some few cases are insusceptible, but not many. Secondary vaccinations fail because they have been previously vaccinated, and are still protected. Other failures, even in primary vaccinations, are sometimes due to the fact that the virus was shipped in an over-heated car and hence spoiled in transit. And a still more frequent cause is that the goods

are exposed to excessive heat or moisture in the office or store of the druggist, or by the physician carrying it in his vest pocket. It can be guaranteed for sixty or ninety days, for vaccine is not injured by age as frequently as is generally supposed, if kept in a cool, dry apartment. In fact, we have sent it to China, Hindoostan and Palestine with success. Many physicians fail in consequence of their method of operating. We do not want to say that our method of vaccinating is the best, but we will give what we have found to be the most successful manner of proceeding, and also why we think others have failed.

Our plan is to scarify the part thoroughly by scraping off the scarf-skin, and scratching the surface, thus abrading, in two directions, roughing it, so as to get the lymph retained close to the mouths of the absorbent vessels. The portion scraped should not be too large, as too large a surface often results in great violence, or an ulcer is produced where a simple vaccination was intended. We touch one side of the ivory point in a drop of water, shaking all possible off again, then apply it by rubbing it well upon the scarified surface, depending largely for our moisture upon the amount of serum which exudes from the scarification to dampen it, and aid us in removing the virus from the ivory point. Often this serum, with the water we have used, is excessive, when we can readily form a paste by the use of the other side of the ivory point which was not dampened in this manner. We are certain of getting a sufficient number of vaccine corpuscles within reach of the mouths of the absorbent vessels, and to finish the operation we gently prick, or scratch, the arm with the ivory point we have just used. Many physicians use too much water and are unable to form a paste, the little corpuscles floating off, and being very glutinous, adhere to the skin, the physician thinks he has gathered them up, and finishes by getting all he can upon the scarified surface, but does not succeed in getting much else than the serum; the absorbent vessels exhaust themselves absorbing this material, and fail to get in any of the corpuscles required. Again, we have known upon paste, when not finished by pricking it in, to have dried as a varnish beyond the reach of the absorbents, which had been closed by the rubbing process. Another cause of failure is that hosts of physicians clamor for colorless points, forcing the propagator to give them as little as possible in order to keep away from color, and then they use one point for two persons, when it was only intended for one.

Violent Results.—Violent results occur from the use of lymph containing flth, the use of irritating drugs, and the use of virus that has been removed from the animal at the wrong time, for it should be taken early. They also occur from the use of cattle that are too old, which yield a great deal more virus, but which is unnecessarily strong and irritating. Again, the violence may result from the neglect of the physicians to cleanse the arm prior to the vaccination, or the use of an unclean lancet; that is, one used continuously, without being disinfected. (The best way to disinfect a lancet is to dip it into alcohol after each application, and then touch it to a flame.) But a more frequent cause of violent arms

comes from the practice of dressing the arm, after the operation, by means of cotton and adhesive strips. There is not the least doubt but that this imprisoning, as it were, is causing the most mischievous results, and often death. We emphatically say, keep the arm loosely clothed, put no dressing upon it, unless it is a protection shield properly made, and advise the patient to use the limb as little as possible, and keep it clean. With good vaccine and the proper care you will have very few bad cases, unless you can find a very marked syphilitic history in your patient. Our experience has proven that syphilitic families with a decided history have shown a strong tendency to violent action.

To sum up the dangers, we might say that they come from the improper selection of cattle; from the filthy condition of the establishment in which they are kept; its dangerous location; the plan of procuring virus by pressure, and to carry it to another apartment after having been removed, instead of putting it on the ivory points warm, and allowing it to dry quickly. Packing it in dangerous materials for the sake of cheapness, the propagator either wanting to avoid correspondence with the consumer, or else, ashamed of his goods, fails to put his label on. The druggist and physician looking for goods that cost less than ten cents a vaccination, sacrificing the lives of their patrons by buying dangerous vaccine, or that which is not vaccine at all, because it is sold to them at cut prices. The druggist may keep a good article too long; it can always be exchanged for fresh without extra cost—this would be simple carelessness on the part of the dealer; the physician's retaining the goods in a vest pocket, or hot office; neglect of cleanliness in operating, want of knowledge of a proper method, and an over-anxious desire to protect the arm.

When is the Physician Safe?—How shall the physician know when he is safe, and how shall he obtain the best results? First, by keeping in touch with the best propagators. Ascertain for a certainty that they have the proper kind of establishments and exercise the proper care. Let the physician buy from a druggist upon whom he can depend, being certain that he is not getting cut rate goods; be sure that the goods bear the label and full address of the propagator, that he may be able to correspond with the producer, should he have any difficulty, either from failure or excessive action. Let him await for results of bovine virus from five to eight days, and to look with suspicion upon anything that acts on the second, third or fourth day. In this way he can avoid many of the dangers, and protect his patient, as well as help overcome the fraudulent practices of those who care not for the health of their fellow beings.

How to Remedy by Inspection.—It has been suggested that the government assume control. To assume the role of propagator, would, in this country, be a greater failure than it is to-day in those countries that have tried it. We are exporting vaccine to-day because it is pronounced superior to theirs, and I was informed this summer at Chicago by their own people that the government virus was not generally used by the intelligent classes. State propagation is not practicable for the one reason, if no other,

that there is not sufficient demand to enable the preparator to keep up a continuous preparation, or carry sufficient stock to be able to meet the demand when it arises. I would suggest a National Board of Health, composed of one member from each State Board, they to appoint inspectors from their number whose duty it would be to thoroughly inspect every vaccine establishment of the country, and allow none to be sold without a registry number, guaranteeing to the druggist, physician and layman that the article he buys, uses, or has used upon him or his children has received the sanction of the proper authorities. Then, and not until then, can compulsory vaccination be justly enforced.

THE ALCHEMIST.

Sic transit gloria mundi! So passes the glory of the world with alchemy, the once glorified science of the world's shrewdest thinkers and investigators, and now, the ridicule of the common herd! Were our forefathers really so ignorant that they could not detect the fallacies into which alchemy betrayed them? No, they were by no means ignorant; they were simply biased by erroneous conceptions; and can we really be certain that we are no longer subject to the same sources of error? As long as we believe in miracles, we shall look for miracles, wear galvanic chains, diet ourselves on Revalenta Arabica, seek the fourth dimension in spiritualism, and look to miraculous sources for the healing of our bodily infirmities.

Aristotle was a great scholar and a deep thinker, but there was a great deal that he did not know. According to his view, all matter could be classified as dry or moist, hot or cold; air was moist and hot, fire dry and hot. On such views, it was easy to rear the inference that the properties of substance might be so modified that, subject to another set of conditions, it might be changed into an entirely new body. Aristotle taught, especially, that a mixture is such a union of two or more substances as involves neither the loss of one nor the other, nor results in both remaining unchanged, but rather in the formation of a third substance with properties opposite to those which produced it. The noble metals, he argued, were obtained by separation from substances which afforded no direct evidence of their presence; might not, then, ignoble matter generally, be made to yield the precious metals? Geber, the Arabian, dissolved gold with aqua regia. Might not, then, he who could dissolve gold, also make gold? The art of making gold appeared, theoretically, so possible of achievement, that one cannot wonder that attempts were made to realize it practically. Geber's theory was that all metals were compounds of quicksilver and sulphur, differing from each other only in consequence of the varying proportions of the two substances, and of the conditions of their intermixture. He did not, however, mean common sulphur, but a basic substance which he regarded as the principle of combustion.

The magic medium supposed to possess the power of converting ignoble metals into gold was called the "Philosopher's Stone," "the red lion," "the great elixir," "magisterium," or "the red tincture;" the medium for the preparation of silver was called "the white lion," "the little magisterium," or "the white tincture."

The experiments of the alchemists resulted in the discovery of some valuable medicinal remedies, and the alchemists at once rose to the idea of an elixir of life which should cure every disease, and admit of prolonging life indefinitely. This belief was entertained by Albertus Magnus, Roger Bacon, Arnold von Villanova, and others renowned for their learning; and their scholars disseminated the teaching throughout the world. The men who were supposed to have discovered the "Philosopher's Stone" were styled "adepts."

But faith in the "Philosopher's Stone" would hardly have made so many proselytes, if the alchemists had not produced chemical preparations which, in themselves, excited wonder. Dioscorides, in the first century A. D., was familiar with the processes of sublimation. Gynesios, Bishop of Ptolemy, described the process of distillation in the fifth century; cupellation had been described by Pliny, Strabo and Dioscorides; Geber was familiar with metallic arsenic, which, on account of its combustibility, he termed the "father of sulphur." It was he who first introduced the wet method into chemistry. By means of nitric acid, he was able to effect decompositions and combinations of which the ancients had not the faintest idea. The director of the great hospital at Bagdad, Mahommed Al Rasl (died 732 A. D.), by means of his medical writings, introduced the use of many chemical preparations to the medical profession. Paracelsus, renowned for his marvelous cures, placed great faith in specific secret remedies (*Specifica Arcana*) suitable for all diseases. Paracelsus is not, however, to be ranked with the pure alchemists, for he taught that the true end of scientific research is not to produce gold but to prepare remedial agents.

The sixteenth century produced a rift between the alchemists and the chemists. A. Libavius (1556) published a valuable text-book on chemistry (still under the style "Alchemy"); and while one set of the alchemists continued to deceive themselves and princes with the delusion of gold-making, another set devoted itself to practical, useful investigation. In the sixteenth and seventeenth centuries, nearly all the principal rulers of Europe were bitten by the alchemist's mania, and a great deal of spurious gold coin—presumably an amalgam of copper—was put into circulation. One of the best results from this line of research must be credited to Böttcher of Dresden, who, though he failed to produce gold, discovered kaolin (porcelain clay) and thus laid the foundation of the still-celebrated Dresden ware.

But, while chemistry made rapid progress, alchemy was slow to die. As late as the opening years of the nineteenth century, Körtum, the author of the "Jobslad," founded, in Berlin, a society of alchemists whose proceedings were published in the *Deutsche Reichsanzeiger*.

The true art of making gold by chemical agency remained undiscovered until 1840, when Liebig published his work on "Organic Chemistry in Its Application to Agriculture," in which, and in his later work, "The Principles of Agriculture" (1855), he taught the art of maintaining the fertility of the soil by restoring to it the substances removed by the crops.—*Der Stein der Weisen*, Vienna, Literary Digest.

EXAMINATION QUESTIONS.

This Department is for the publication of questions and answers from our readers, the subject being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We solicit questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct Answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the names of all persons sending us correct replies.

Write the Number of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA, Box 583, Detroit, Mich.

SERIES NO. 1.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue.

Replies should reach us not later than March 15th, 1894.

1. Give meaning of the term evaporate, and state the difference between evaporation and distillation.
2. What is the difference between a sediment and a precipitate.
3. Give the official fluid or liquid measures, their abbreviations, and their equivalents in minims. (By "officinal" is understood U. S. P.)
4. What is the official thermometer? Why is mercury especially adapted for use in thermometers? Convert—10° R. into degrees temperature official standard.
5. Write a prescription for a four-ounce emulsion containing 25 per cent of castor oil. Give all the ingredients to make an agreeable and homogeneous mixture, with directions for compounding.
6. What significance is attached to the terminations *ate* and *ite* in the nomenclature of salts?
7. Define fermentation. What is a ferment? Give examples (pharmacopoeial) of the products of fermentation.
8. How would you distinguish between morphine and quinine? Between corrosive sublimate and calomel?
9. Two ounces of distilled water at 15° C. will dissolve how many grains of each of the following? Potassium chlorate? Boric acid? Epsom salt?
10. State the difference between annual, biennial and perennial plants, and give an example of each.

SERIES NO. 2.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue.

Replies should reach us not later than April 1st, 1894.

1. In the nomenclature of the Pharmacopoeia how are the titles of substances expressed?
2. What is effervescence? Deliquescent? Name two pharmacopoeial salts which effloresce. Two which are deliquescent.
3. Outline the official process for making syrup of wild cherry. Why is this process used? Upon what constituent does the virtue of this preparation depend? Why is glycerine used in the preparation?
4. Give the official title and the common and maximum doses of Kermes mineral, mercuric chloride, African pepper, tincture of opium, tincture of digitalis, tincture cantharides. Which are toxic, and what are the antidotes?
5. Belladonna. Give the botanical

name. Common name. Country indigenous to. What part is used? When should it be collected? What is the active principle? What is the dose of the powdered leaves? Of the principal alkaloid? Name antidote for belladonna poisoning. Name the official preparations of belladonna.

6. What do you understand by a poison? An antidote? A dose?

7. Write correctly in Latin, without abbreviation, and state the quantities of each ingredient, a formula to make one pint of an elixir, of which each fluid dram is to contain 1 grain of quinine, 1.00 grain strychnine, and 2 grains phosphate of iron.

8. Write an equation showing the reaction which occurs in the preparation of syrup iodide of iron by the official process. Spirit Mindererus. Hydrated Alumina.

9. What is the difference between a hydrocarbon and a carbohydrate? Give an example of each.

10. What is an essential oil? Name several official ones, and state their properties and dose. How would you detect the addition of alcohol to an essential oil?

PHARMACY.

DIALYZED IRON is incompatible with Fowler's Solution, the dense precipitate formed being ferric hydrate.

STRONTIUM BROMIDE INCOMPATIBLE WITH SODIUM BICARBONATE.—On mixing these salts effervescence occurs and a white precipitate is thrown down which consists of strontium carbonate.

QUININE AND ASAPROL are incompatible. If a solution of the former be dropped into a solution of the latter a resinous body separates and adheres to the sides of the tube. If the order of addition be reversed a white precipitate appears which becomes pasty and changes in color to gray.

LANOLIN REACTION.—If 2 grams calcium hydrate and 10 centigrams of lanolin are melted together, avoiding carbonization, cooled, treated with 5 cubic centimeters of distilled water, shaken with 5 cubic centimeters chloroform, on pouring the chloroformic layer upon an equal volume of concentrated sulphuric acid there will appear at the line of separation the deep red color characteristic of cholesterol. This upon the authority of Hilger. (W. Dr.)

COCAINE, BORAX AND GLYCERINE.—Borax produces a precipitate in aqueous solutions of cocaine, which disappears upon the addition of glycerine. Upon heating the mixture it becomes turbid near the surface, the turbidity extending gradually downward, but upon cooling it disappears. It is proposed by a contributor to Rep. de Pharm. to utilize this reaction as a test for the presence of cocaine, and he claims it to be capable of recognizing 1 part cocaine in 1,000 parts solution.

TURKISH HONEY, according to an analysis appearing in Chem. Zeit. under the authority of Dr. A. Fajans, has the composition, water, 7.97 per cent; invert sugar, 56.78 per cent; cane sugar, 31.02 per cent, ash, 0.31 per cent; residue insoluble in alcohol, 0.32 per cent. The chief estimate of the value of honey is afforded by the invert sugar, and only honey whose rotatory power in 20 per cent aqueous solution is more than 1.5 per cent, is

adulterated. Farther, if the sugar, after intervention with sulphuric acid rotates to the right, it is adulterated.

GURJUN BALSAM IN COPAIBA may be detected by mixing 1 gram of pure concentrated sulphuric acid with 25 grams of acetic ether and to 1 or 2 cubic centimeters of this solution add 2 to 4 drops of the copaiba balsam. There should appear no red or violet coloration if the sample be pure. Or thoroughly shake 1 volume of the copaiba with 3 or 4 volumes of water, filter through a wetted filter and add an equal volume of hydrochloric acid (specific gravity 1.12) when no pink color should appear within a quarter of an hour.

MICROCHEMICAL DETECTION OF SULPHUR may be effected, says Emich (Zeitschr. An. Chem., W. Dr.), by the following method, which will detect as little as 0.0000002 gram of combined sulphur. The substance to be tested is placed on a slide, and on it is dropped one drop of a 5 to 25 per cent solution of calcium chloride. Then the slide is inverted and exposed to bromine vapor for from three to five or more minutes. If the substance contains sulphur, crystals of calcium sulphate may now be recognized under the microscope. The test is particularly recommended for inorganic compounds and also the sulphocyanides.

PILL COATING.—The method described by a contributor to a Canadian contemporary directs to moisten the pills with a mixture of one part glycerine and two parts alcohol, then roll them in a powder composed of four parts saccharine, two parts tragacanth and one part potato starch. Remove the excess of powder by a sieve and repeat the operation. To have the pills white, moisten them with a mixture of one part glycerine and two parts ether and coat with a powder of equal parts of talc and calcium carbonate. For cacao coating, use two parts cacao, two parts saccharine and one part tragacanth.

SODIUM PHOSPHATE AND ALKALOIDS.—M. Christiaens has noticed the incompatibility between these substances and a series of tests have shown that the precipitate occurring in mixtures containing them is the alkaloid. He frankly admits that he has been in the habit of filtering such solutions before sending them out, but now he seems to have experienced a change of heart, and in L'Union Pharma. states that the phosphate of soda should be exactly neutralized with phosphoric acid, when this precipitation will not be induced. He makes the broad statement that all salts of alkaline reaction will precipitate alkaloids from their combinations.

GLYCERINE SUPPOSITORIES.—R. J. Lindberg told the members of the North Dakota Pharmaceutical Association at its last meeting how to make glycerine suppositories of very elegant appearance. Ten parts of stearic acid are dissolved in 180 parts of glycerine heated to just the proper temperature and to the solution is then added 5 parts of carbonate of soda, and after the mass becomes perfectly transparent it is poured into suitable molds. If upon cooling the suppositories are opaque too little carbonate of soda has been used and a little more should be added. Too high a degree of heat should be avoided. Various medicinal substances can be incorporated as desired.

LIQUID AIR.—The intensely interesting and valuable experiments and results described by Prof. James Dewar in recent lectures at the Royal Institution are attracting very much notice. In accounts of this last lecture given by our English contemporaries we are told that liquid air is continually boiling and passing away into gaseous air at a temperature of 190 below zero Centigrade, equal to about 350° of frost on the Fahrenheit scale, but the air can be kept in its liquid state for from thirty to forty hours if the proper precautions are taken. Even alcohol, the most unfreezable of liquids, yields to the intense cold of liquid oxygen. Some alcohol poured on the surface became converted into a little block of ice, which, for the time being, lost its power to burn. When taken out it gradually melted into a kind of treacly mass and finally resumed its liquid form.

SYRUP OF IPECAAC AND OPIUM.—This preparation, sometimes called Syrup of Dover's Powder, is a popular one and many formulas have been suggested. H. L. Grimes reports to Merck's Market Report that, while considering the N. F. formula the best yet published, he believes the following, which he has evolved, gives a superior preparation:

Fluid extract ipeac.....	30 c. c.
Deodorized tincture of opium	335 c. c.
Glycerine	35 c. c.
Syrup (special) enough to make	3,785 c. c.

Each fluid dram of this syrup represents 5 grains of Dover's Powder, or 1/2 grain each of opium and ipeac. The special syrup directed is prepared by dissolving with the aid of gentle heat 3,175 kilos of sugar in 1420 c. c. of water and straining through muslin when thoroughly cool. Ten per cent of glycerine can be added if thought advisable.

DETECTION OF COTTON SEED OIL AS AN ADULTERANT.—Cotton seed oil is largely used as an adulterant of other oils, particularly of olive and lard oils, and a test mainly relied on for its detection has been Bechi's, which depends upon the darkening of silver nitrate in contact with the oil. Of late there have been produced and now appear in commerce grades of cotton seed oil which do not afford this reaction, and Gantner (Chem. News) offers a method for detecting this quality of cotton seed oil in admixture. One cubic centimeter of the melted oil (which must be perfectly clear) is placed in a test glass and is then dissolved in 10 cubic centimeters of petroleum ether, a drop of concentrated sulphuric acid allowed to fall into the solution, and the whole immediately thoroughly shaken. The color changes are very pronounced and of characteristic variation in various fats. Pure lard develops a pale straw to a faint reddish-yellow, the solution remains at first clear but by degrees separates heavy drops of a strong reddish-yellow color, while the supernatant liquid remains slightly yellowish and in most cases clear. Cotton seed oil, however, gives at once a deep brown or black and the color is not discharged on standing. Mixtures of lard and cotton seed oil vary in color in proportion to the amount of the latter present, but the dark color is sufficiently pronounced even with but 1 per cent of adulterant. Olive oil gives results similar to lard.

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and **ASSOCIATES' CONTRIBUTIONS RECEIVE NO ATTENTION.** To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

5954. Books on Grasses, Fungi and Insects.

A correspondent kindly sends in the following information supplemental to that in our last issue: For grasses, sedges and liverworts a complete analytical scheme may be found, illustrated with twenty-five copper-plates, in Gray's Manual of Botany, published by the American Book Co., 1890. For the morphology of these, and the (old) orders of algae, lichens and fungi consult Lennis, Part II., Botany, 1884. This work is well illustrated and the information there given is in great detail worked up to date by Dr. Frank. The work, however, appears only in German. There seems to be no scientific work in English devoted to the analysis of all of the larger fungi (mushrooms). The Agricultural Department in Washington published two monographs on twelve edible and twelve poisonous common mushrooms, which may be had for the asking. The only work which treats of this class of botany completely is in French: "Champignons," by G. Siccard, and published by Delegrave, Paris.

As to books on insects; the only scientific scheme for analysis is one on the Lepidoptera, subdivision Rhopalocera (Day butterflies), by Prof. Sam. H. Scudder. A very fair survey of the whole field may be gleaned from W. B. Carpenter's Zoology, Vol. II., and Kingsley's Natural History, Insects.

Additional information upon the subject of mosses may be found in Lesqueux and James' "Mosses of North America," and upon the subject of grasses in Beal's "Grasses of North America for Farmers and Students." The author of the last named book is the well-known professor of botany in the Michigan Agricultural College at Lansing.

5960. Indelible Ink.

(F. W. M.) See reply to query No. 5917 in the February 1st issue of the Era.

5961. Essence of Peppin.

(M. J. G.) See Era of September 15, 1892, page 173, and December 15, 1892, page 362.

5962. Baking Powder.

(J. G. J.) See formulas in the last issue of the Era, page 144. Also October 15, 1893, Era, page 350, and November 1st, page 494.

5963. Elixir of Opium.

(M. J. G.) The proprietary preparation you name is said to be identical in every particular to the deodorized tincture of opium of the pharmacopoeia.

5964. Dermatol.

(D. W.) We expect to publish in an early issue a complete exposition of the law governing the subject of patents and trademarks as applied to medicinal substances.

5965. To Preserve Bicycle Tires.

(E. S. E.) There are no specific directions to this end so far as we are aware. No preparation can be applied to the rubber tire which will in any way preserve it. About the only suggestions that can be made are to remove the weight of the machine from the tire either by suspending it, or by inverting it so that the weight may rest upon the handles and saddle. The same care necessary to the preservation of ordinary rubber goods would hold in the case of rubber tires. Avoid extremes in temperature and use no oil, varnish or other dressing to preserve the rubber. No special care other than as suggested would seem necessary.

5966. Edelweiss Perfume.

(W. R.) The following is taken from Lete's Manufacture of Perfumery:

Extract jasmin	250 drams.
Extract tuberose	250 drams.
Extract orange	125 drams.
Extract heliotrope	125 drams.
Extract yachinthe	125 drams.
Oil bergamot	10 drams.
Oil basil	5 drams.
Tincture musk	5 drams.
Tincture ambergris	5 drams.
Tincture oil bitter almonds	2½ drams.
Tincture angelica	25 drams.
Tincture vitivert	25 drams.

The extracts noted in this formula are the odors extracted from French flower pomades.

5967. Cherry Phosphate.

(H. B.) Try the following:
Pure cherry syrup..... 4 pints.
Pure raspberry syrup..... 4 pints.
Acid solution phosphate. 8 fl. ounces.
Wild Cherry Phosphate:
Pure wild cherry syrup..... 6 pints.
Pure grape syrup..... 1 pint.
Sherry wine

1 pint.
Acid solution phosphates. 8 fl. ounces.
Syrup of cherry may be made by mixing two pints black cherry juice with one gallon plain syrup.

Wild cherry syrup for the soda fountain may be made by the following formula:
Wild cherry bark (in coarse powder) 12 ounces.
Glycerine

4 fl. ounces.
Crushed sugar

3½ pounds.
Distilled water, a sufficient quantity.
Moisten the bark with 14 fluid ounces of water and allow it to stand in a warm place for 24 hours in a covered vessel, then pack it firmly in a percolator, and pour water upon it until 2 pints of the percolate is obtained. Dissolve the sugar in the liquid by agitation, without heat, add the glycerine and strain. The formula for acid solution of phosphates may be found elsewhere in this department.

5968. Prescription Query.

(W. H. B.) sends in the following prescription:

Solution ammonium acetate	2 fl. ounces.
Camphor water	1½ fl. drams.
Spirital nitrous ether.....	½ fl. ounce.
Tartar emetic	2½ grain.
Morphine acetate	½ grain.

Should the prescription when compounded make a colorless preparation? Does the order of mixing the ingredients make any difference in the color of the preparation? The prescription was compounded in several different ways and in each case the final result was the same, showing that the order of procedure had nothing

to do with the color of the preparation, which was invariably the same upon allowing the mixture to stand a short time. The color change observed is due to the decomposition of the spirit nitrous ether. There are several points to be taken into consideration in the discussion of the chemical changes likely to take place between the various ingredients. Thus, if the solution of acetate of ammonium be acid it will be incompatible with the spirit of nitrous ether and the tartar emetic, and, upon the other hand, if it be alkaline it will be incompatible with the tartar emetic and the morphine acetate. Upon the whole, a number of changes are likely to take place, indeterminate in their character, but which eventually end in the decomposition of the spirit of nitrous ether, which accounts for the color change observed.

5969. Chicle Chewing Gum.

(C. F. B.) The processes used by different manufacturers in preparing chicle for use in the manufacture of chewing gum are nearly identical and differ only in detail. When the chicle is received at the factory it is broken into small pieces and the foreign material with which it is contaminated, such as sticks, stones and dirt, is carefully removed. After these have been eliminated the broken pieces of chicle are placed in large iron retorts and melted together with sugar. Each retort contains a churning arrangement which thoroughly mixes the melting sugar and chicle. After this process the flavor is given by adding oils such as peppermint, wintergreen, etc. While the gum is still warm it is taken to the kneading rooms, where it is thoroughly worked and kneaded until it looks like gingerbread ready for the oven. Fine sugar is added from time to time to prevent "sticking" in the kneading process. When sufficiently kneaded, the pieces of gum are rolled through steam rollers into sheets of the exact thickness required. These sheets are then placed under a marker, which indents and lines out the "sticks" of a desired size. They are then dried, separated, wrapped and packed ready for the market. A formula for the preparation of a chicle gum was given in the April 15th Era, 1893, page 350. Whether it will be available to you in the present instance can only be proven by trial.

The Era expects to present in its next issue an article upon this subject from a practical standpoint and it will contain other information you desire.

5970. Filtering a Decoction.

(Subscriber) sends in a prescription for a decoction to be made from some eleven different coarsely cut barks, leaves and roots. He says he has experienced considerable difficulty in percolating and filtering the decoction after boiling. A decoction as a rule is not intended to be either percolated or filtered, but strained. If strained while hot, it deposits a portion of insoluble matter on cooling, which may or may not contain active ingredients; but it is generally advisable to retain the precipitate and diffuse it through the liquid, stirring or shaking it up before taking each dose. Of course, if you do not want to retain the precipitated insoluble matter you can strain the decoction while hot, allow the liquid to stand until the precipitate settles and then carefully decant or draw off the clear portion. Such a procedure does not seem advisable in the present instance, however.

5971. Peptonized Foods.

(C. H. C.) Peptonoids, or rather peptones, are formed by the action of pepsin or pepsin and pancreatin on albuminous foods or substances. They are, in fact, partially digested foods fitted for assimilation. Upon this line manufacturers have introduced preparations containing peptonoids to aid deficient peptic digestion. Albuminous foods or substances may also be digested by means of some one of the various vegetable ferments, such as papayotin, etc.

(1.) According to Wood, a peptonized beef may be prepared by simmering $\frac{1}{2}$ pound of minced beef for two hours in 1 pint of water containing 20 grains of bicarbonate of sodium, allowing to cool to about 100° F., digesting at this temperature with a tablespoonful of pancreatic extract for 3 hours, decanting and momentarily boiling.

(2.) Another preparation may be made by chopping lean beef very fine and macerating it for about 6 hours in a solution of pepsin with water and hydrochloric acid at a temperature of about 100° F. In this way the beef is mostly dissolved, the mixture is strained, and the solution may be combined with various medicines, as may be required. Sometimes an excess of pepsin and pancreatin are added, and the solution thus prepared is added to wines, elixirs, and emulsions.

5972. Face Powders.

(J. D. H. C.) Various substances are made use of in the manufacture of toilet powders to give them an oily feel. The product known in commerce as "Blanc fard" or "Blanc francais" is obtained by mixing 100 parts moist powdered talc with 12 parts of spermaceti, previously rubbed to a moist powder with some alcohol, and dried at a moderate heat. Then, too, powdered stearite or soapstone may be used as the basis of a powder possessing this property. Here is a formula from the Era Formulary which may be of service to you:

Pistachio meal (in finest powder and deprived of the oil)	10 pounds.
Talcum	10 pounds.
Oil lavender	$\frac{3}{4}$ ounce.
Oil rose	$\frac{1}{2}$ ounce.
Oil cinnamon	$\frac{7}{8}$ grains.

Hager gives the following:

Powdered starch	20 grams.
Powdered talc	10 grams.
Ultramarine	0.15 grams.
Oil rose	1 drop.
Oil neroli	1 drop.
Tincture musk	1 drop.

Tint as desired.

A few experiments along the line of these suggestions will, we think, enable you to produce a satisfactory article. In the March 1st, 1892, Era were published a large number of formulas for face powders from which you may also get some valuable suggestions.

5973. Washing Fluid.

(J. W. & Co.) A great many formulas for preparations of this nature have been published from time to time in the Era. In addition to the two below, see Era of July 15, 1892, page 61, and Era for April 15, 1892. In the issue last named will be found a variety of formulas for washing and cleaning operations.

Soap	2 ounces.
Boiling soft water	1 gallon.
Stronger ammonia	$\frac{1}{4}$ ounces.

For a cheap washing fluid and one easily made, this is one of the best.

(2.)

Dissolve 2 pounds of soap in five gallons of water as hot as the hand can bear it; then add three large size tablespoonfuls of liquid ammonia and one spoonful of best oil of turpentine. These fluids are incorporated rapidly by means of beating them together with a small birch broom. The linen is then soaked in this liquid for three hours, care being taken to cover the washing tub with a closely fitting wooden cover. By this means the linen is thoroughly cleaned, saving much time, rubbing and fuel.

5974. Vesicant Collodion.

(D. J. H.) Try the following process taken from the British Pharmacopoeia: Cantharides in powder... 5 ounces. Acetic ether, a sufficiency.

Mix the cantharides with 3 fluid ounces of acetic ether; pack in a percolator, and at the expiration of twenty-four hours pour acetic ether over the contents of the percolator, and allow the solution to pass slowly through until 20 fluid ounces are obtained. To this liquid in a stoppered bottle, add 1 ounce of pyroxylin and shake them together until the latter is dissolved.

Here is another from the Era Formulary:

Cantharidin	1 part.
Castor oil	40 parts.
Acetone	40 parts.
Collodion	900 parts.

Rub up the cantharidin in the oil, heating carefully to hasten solution. Let cool, add the acetone, and finally incorporate the collodion. If desired the preparation may be colored by the addition of 10 parts tincture of hemp. The acetone is used on account of its superior solvent action upon the cantharidin. According to Dieterich it is the best solvent for cantharidin, one part of the latter at 15° C. requiring 35 parts of acetone, 65 parts of chloroform and 550 parts of ether to effect solution.

5975. Terpin Hydrate.

(S. S. L.) This is one of the preparations recently made official by the United States Pharmacopoeia and there described as colorless, lustrous, rhombic prisms, nearly odorless, and having a slightly aromatic and somewhat bitter taste, soluble in 250 parts of cold (15° C.) or 32 parts of boiling water, in 10 parts of cold or 2 parts of boiling alcohol; also soluble in about 100 parts of ether, 300 parts of chloroform, 1 part of boiling glacial acetic acid, and to some extent in carbon disulphide, benzene and turpentine. Terpin hydrate is sometimes called "Turpentine camphor" and is usually prepared by the interaction of a mixture of rectified oil of turpentine 4 parts, alcohol 3 parts, and nitric acid 1 part. The mixture is allowed to stand in shallow porcelain dishes during some days, when a crystalline body separates, which is collected, drained, pressed between bibulous paper and crystallized in the cold from 95 per cent alcohol made alkaline with a little potash and soda. At a temperature of 116° to 117° C. it melts, with the loss of water, and at the temperature of boiling water, sublimates in fine needles. A list of tests of identity and purity is given in the Pharmacopoeia. Terpin hydrate is sometimes deposited from oil of turpentine when the latter contains water.

As to its medicinal application, it has antiseptic and expectorant properties and has been employed to some considerable extent in subacute and chronic bronchitis and whooping cough. It has also been recommended as a diuretic in chronic inflammation of the kidneys. The dose as an expectorant is stated at from 2 to 3 grains. As a diuretic in chronic nephritis, it may be given in from 5 to 6 grains, and in whooping cough from 20 to 40 grains. It is best administered in tablets or in alcoholic and syrupy mixtures.

5976. Kola-Coca Syrup for the Soda Fountain.

(Subscriber.) Under the title "Kola-Coca Syrup" Dubelle gives the following:

Plain syrup	7 pints.
Kola wine	$\frac{1}{2}$ pint.
Coca wine	$\frac{1}{2}$ pint.

The same authority gives this for "Kola-Coca Malt Phosphate":

Extract of malt	2 pounds.
Kola wine syrup	3 pints.
Coca wine syrup	1 pint.
Cinchona wine syrup	1 pint.
Pure orange wine	1 pint.
Spirit of rose	$\frac{1}{4}$ fl. ounce.
Acid solution of phosphates	8 fl. ounces.

The kola wine syrup is made by adding 2 pints of kola wine to 3 pints of simple syrup. The coca wine syrup by adding 2 pints of coca wine to 3 pints of simple syrup.

The acid solution of phosphates may be prepared from this formula:

Potassium phosphate ..	80 grains.
Magnesium phosphate..	160 grains.
Sodium phosphate	80 grains.
Calcium phosphate	240 grains.
Ortho-phosphoric acid...	8 fl. ounces.
Water enough to make...	8 pints.

5977. Egg Shampoo.

(W. E. C.) The following are taken from the Era Formulary:

(1.) Ammonia water	3 fl. drams.
Cologne water	3 fl. drams.
Alcohol	5 fl. ounces.
Water	5 fl. ounces.

Whites of eggs, as many as desired.

The whites of eggs (about 2) are thoroughly beaten up previous to being mixed with the water and water of ammonia; the remaining ingredients are added in their order and the whole stirred briskly.

(2.) New England rum	15 ounces.
Bay rum	10 ounces.
Glycerine	1 ounce.
Borax	2 ounces.
Whites of egg	2

Difficulty may be experienced in dissolving 2 ounces of borax in the alcoholic liquids; it is recommended to incorporate the borax in fine powder with glycerine, and to add the bay rum and New England rum gradually and with constant stirring to the mixture. The white of egg is well beaten and added to the solution of borax, and the whole stirred thoroughly until an even mixture results.

(3.) Yolk of one egg.

Rose water	1 pint.
Eau de cologne	1 fl. ounce.
Transparent soap	1 dram.
Rectified spirit	$2\frac{1}{2}$ ounces.
Carbonate of potassium..	1 dram.

Dissolve the carbonate of potassium in half the rose water over a water bath, then mix the other half, and slowly rub down with the yolk of egg. Lastly add the spirit and eau de cologne.

(4.) Shampoo Cream.—Soap (fine, white, in shreds), $\frac{1}{2}$ ounce; rose water, 1 fluid ounce; solution of ammonia, 1 fluid ounce, alcohol or bay rum, $\frac{1}{2}$ fluid ounce; rain water, 8 fluid ounces. Dissolve the soap in the rain water by heat, and when nearly cold add the ammonia, rose water and alcohol, stirring constantly.

5978. Deodorizing Alcohol Without Distillation.

(M. J. B.) No process will deodorize alcohol so satisfactorily as distilling it with potassium permanganate or some similar oxidizing agent. However, here are two processes for the purification of alcohol which may answer your purpose:

(1.) Alcohol 1 gallon.
Unslaked lime 4 drams.
Powdered alum 2 drams.
Sweet spirits of nitre 1 dram.

First reduce the lime to a very fine powder, add to it the alum, mix the two powders well together, and pour them into the alcohol. Shake well, add the sweet spirits nitre, and shake again. After the mixture has been kept a week, with occasional agitation, filter it through animal charcoal, when a pure, deodorized spirit will be the result.

(2.) Cover 10 pounds of animal charcoal with a few inches of water, add 1 $\frac{1}{2}$ ounces of concentrated sulphuric acid, agitate the mixture thoroughly, and let it stand over night. Draw off the water the next day, and wash the mixture with fresh water until the latter has no longer an acid taste and does not redden litmus paper. The drained off charcoal is then placed upon the perforated bottom of the filtering apparatus, covered with a layer of flxivated straw $\frac{3}{4}$ to 1 inch thick. Upon this is placed another perforated bottom, and upon this a mixture of 1 pound of magnesite, 20 pounds of wood charcoal and 5 $\frac{1}{2}$ pounds of pyrolusite. This is also covered with a layer of flxivated straw and a finely perforated plate upon which comes a thick layer of river sand previously washed and dried. The liquor to be purified is then compounded with $\frac{3}{4}$ ounce of spirit of ammonia to every 20 gallons. The liquor is allowed to remain quietly for a few days and is then gradually passed into the filter, where it remains for 3 days, when the purified liquor is drawn off and the filter may be replenished.

5979. Preservation of Oil of Lemon.

(M. J. B.) There have been numerous processes suggested for this purpose, but none of them are of value unless used in connection with the proper storage of the oil and its careful protection from light and air. Oil of lemon, like many other volatile oils, absorbs oxygen from the air with avidity and combines with it. In the oxidation process the thinny fluid oils become perceptibly more thickly fluid, the final product being a resinous body. To prevent evaporation, as well as the effects of light and air, the oil should be preserved in not too large bottles kept as full as possible, and closed with a good cork, over which may be tied a piece of bladder. The bottles should be stored in a cool place. The preservation of the oil may be assisted in several ways, one of the best, and perhaps the least objectionable, being the addition of from 0.5 to 1 per cent of anhydrous alcohol. Sodium bisulphite, in the proportion of 50 grains to 1 pound of the oil, has also been recommended for the purpose.

Früh recommends the following method:

To every pound of oil one ounce of alcohol is to be added, and well mixed, then one ounce of water is added, which withdraws the alcohol from the oil and collects at the bottom as diluted alcohol, separating a resinous film. It should be allowed to remain until the oil is used. It is said oil of orange may be treated in the same manner with excellent results.

To restore old and resinified oil Curieux recommends a strong solution of borax, which is mixed with animal charcoal, and then agitated with the oil. For large quantities the simplest process is, perhaps, redistillation with water, and sometimes with a little alkali. Another process consists in mixing the oil with a solution of permanganate of potassium in the proportion of 1 ounce of the salt to 8 ounces of water; this quantity is sufficient for 4 pounds of the oil. The mixed oil and the solution are agitated together for some time, when the oil is decanted, mixed with fresh water, and warmed gently until it floats on the surface.

5980. Lacquer Polish.

(J. G. J.) Just what you mean by "lacquer polish" is rather indefinite. Lacquers are used upon polished metals and wood to impart a lustrous appearance. Here are several formulas:

Lacquer for Brass:

Turmeric 1 ounce.
Annatto $\frac{1}{4}$ ounce.
Spanish saffron $\frac{1}{4}$ ounce.
Shellac 3 ounces.
Alcohol 16 ounces.

Digest the first three ingredients with the alcohol for 24 hours, then dissolve the shellac in the liquid.

Gold Lacquer:

Ground turmeric 1 pound.
Gamboge 1 $\frac{1}{2}$ ounces.
Gum sandarac 3 $\frac{1}{2}$ ounces.
Shellac, powdered $\frac{1}{2}$ pound.
Alcohol 2 gallons.
Turpentine varnish 1 pint.

Digest for a week, frequently shaking the mixture; then decant and filter.

To Lacquer Flowers:

Pulverize 40 parts of sandarac, 15 parts of mastic and 2 parts of camphor, and put the powder into a long-necked flask; then pour 1,000 parts of rectified spirit over it, and place the flask in a moderately warm place, shaking it at first frequently, and then allowing it to stand quietly so that the fluid may settle. Flowers, plants and herbs may be coated with this lacquer. It is also adapted for coating maps, cards, copper prints and pictures.

Black Lacquer for Leather:

Dissolve—
Best shellac 40 grams.
Sandarac 10 grams.
Mastic 5 grams.

In $\frac{1}{2}$ litre methylated spirit, and add 20 to 30 grams pure Venetian turpentine. The solution is colored a deep black by adding nigrosin.

5981. Liquid Shoe Polish.

(C. J. C.) Three distinct formulas may be found on page 14 of the January 1st issue. Some one of the following, however, may prove more satisfactory for your purposes:

(1.) Alcohol 1 gallon.
White turpentine 1 $\frac{1}{2}$ gallons.
Venice turpentine 4 ounces.
Shellac 4 pounds.
Sweet oil 4 ounces.
Lampblack 2 ounces.

(2.) Ivory black 4 ounces.
Lined oil 4 $\frac{1}{2}$ ounces.
Treacle 4 ounces.
Coppers 4 $\frac{1}{2}$ drams.
Vitriol 4 $\frac{1}{2}$ drams.
Vinegar, quantity sufficient.

(3.) Yellow soap $\frac{1}{2}$ ounce.
Yellow wax 4 $\frac{1}{2}$ ounces.
Boiling water 10 ounces.
Turpentine 10 ounces.

Melt the wax in the turpentine, dissolve the soap in the water, mix in a hot mortar and stir until cold. By adding 1 ounce of extract of logwood brown dissolved in water a good polish for brown leather boots results.

(4.) Lampblack $\frac{3}{4}$ ounce.

Indigo, in fine powder 1 dram.

Rub together in a mortar with sufficient muciilage (made by dissolving 4 ounces of gum arabic in $\frac{1}{4}$ pint of strong vinegar) to form a thin paste; add very gradually of sweet oil 1 ounce; triturate very thoroughly until intimately mixed, when the remainder of the muciilage is added; then further add of treacle $\frac{1}{2}$ ounces; and afterwards, successively of strong vinegar 2 ounces, alcohol 1 ounce. Bottle for use.

(5.) Mix the whites of two eggs with $\frac{1}{2}$ ounce of alcohol, 2 large lumps of sugar (crushed), and sufficient finely powdered ivory black to give the required color and thickness, avoiding excess. The last named preparation is commonly laid on with a sponge or soft brush, and when almost dry or hard may have its polish heightened with a brush or soft rubber, after which it is left for a few hours to harden.

5982. Floor Polish.

(O. P. S.) The following are several formulas from the Era Formulary:

(1.) Stearin 1,000 parts.
Yellow wax 250 parts.
Potash 600 parts.
Hard soap 100 parts.
Water and coloring matter to suit.
(2.) White wax 750 parts.
Bleached shellac 750 parts.
Bright resin 60 parts.
Oil of turpentine 1,000 parts.
Alcohol 4,000 parts.

Melt the wax, shellac and resin together, remove from the fire and add, while still hot, the turpentine, and stir well. Warm the alcohol to a point nearly that of the solution and add, with rapid and thorough stirring.

(3.) Cut 1 pound of best beeswax into small pieces, dissolve thoroughly in 3 pints of turpentine, stirring occasionally if necessary. The mixture should be only a trifle thicker than the turpentine alone. Apply it with a rag to the surface of the floor, which should be smooth and perfectly clean; this is the difficult part of the work, for the right amount to be applied is learned only by experience, less being required for hard, coarse-grained wood than for soft and open-grained. Experiment on a square foot or so at first. Put on what you think is enough, and leave it for 24 hours, or longer if necessary. When thoroughly dry, rub it with a hard brush until it shines. If it polishes well, repeat the process over the entire floor; but if not, remove the wax with fine sandpaper and try again, using more or less than before until the desired result is secured. If the mixture is slow in drying, add a little Japan dryer in the proportion of about 1 part of the dryer to 6 of turpentine.

(4.) Boil 20 parts of litharge in 100 parts of linseed oil for an hour, then add 75 parts of best yellow wax melted and 7 parts of tallow, and 90 parts molasses. Heat to 230 degrees F. until the water is evaporated, and then add 50 parts lamp-black, 140 parts turpentine, 17 parts alcohol, 2½ parts shellac, 1 part aniline.

5983. Syrup Hypophosphites.

(D. J. H.) Here are several formulas taken from a many sources, said to make similar preparations to the one you name:

(1.) Strychnine 1 grain.
Quinine 40 grains.
Magnesium hypophosphite..... 40 grains.
Hypophosphorous acid.. 110 grains.
Dissolve in 1 ounce distilled water and filter.

Sodium hypophosphite... 160 grains.
Calcium hypophosphite... 160 grains.
Solution hypophosphite of iron..... 3 ounces.

Dissolve and filter, mix the two filtrates, add 4 ounces glycerine and sufficient syrup to bring the whole up to 1 pint.

(2.) Glucose..... 1 pound.
Simple syrup..... 1 pint.
Hypophosphite of calcium..... 138 grains.
Hypophosphite of potassium..... 48 grains.
Sulphate of iron..... 48 grains.
Sulphate of manganese... 32 grains.
Sulphate of quinine..... 14 grains.
Sulphate of strychnine... 2 grains.
Water, q. s..... 2 pints.

Dissolve the calcium hypophosphite and potassium hypophosphite in 2 fluid ounces of the water. Add to 1 ounce of the water 3 fluid drams of syrup and dissolve in the mixture, by aid of heat, the remainder of the salts. Mix the solutions and set by for a few hours, covered, until the deposit of calcium sulphate subsides. Filter into a bottle containing the remainder of the syrup; wash the residue with 1 ounce of boiling water; mix filtrates and washings with the syrup. Dissolve the glucose in the mixture and add enough water to make the preparation measure 2 pints.

(3.) Hypophosphite of calcium..... 740 grains.
Hypophosphite of sodium..... 256 grains.
Hypophosphite of potassium..... 192 grains.

Hypophosphite of manganese..... 192 grains.
Sulphate of iron (crystals)..... 370 grains.
Strychnine 4 grains.
Sulphate of quinine... 123 grains.
Sugar 24 troy ounces.
Orange flower water... 1 fl. ounce.
Diluted sulphuric acid,
Diluted hypophosphorous acid,
Water of ammonia,
Distilled water.

Of each, sufficient quantity.

Dissolve 228 grains of hypophosphite of calcium in 4 fluid ounces of distilled water; mix and filter. Dissolve the remainder of hypophosphite calcium with the other hypophosphites in 4 fluid ounces hot water, using about 1 to 2 fluid drams diluted hypophosphorous acid to aid solution; mix the two solutions and set aside. Dissolve the strychnine in 2 drams water, by aid of a few drops of hypophos-

phorous acid, and again mix with the other solutions. Now dissolve the quinine sulphate in about 8 ounces water, using a little diluted sulphuric acid, precipitated with sufficient diluted ammonia (1 part ammonia to 6 of water) until the ammonia is in slight excess. Wash the precipitate and transfer to a mortar, rub to a paste, gradually add diluted hypophosphorous acid to perfect solution, and add to the other solution, making the whole measure about 16 fluid ounces. To this add the orange flower water and sugar and dissolve cold by shaking. Lastly, filter, add water to make the whole measure 32 fluid ounces. Each fluid dram contains hypophosphite of calcium, 2 grains; hypophosphite of sodium, 1 grain; hypophosphite of potassium, ¼ grain; hypophosphite of manganese, ¼ grain; hypophosphite of iron, ¼ grain; quinine, ½ grain; strychnine, 1-64 grain.

5984. Artificial Flavoring Extracts.

(H. Bros.) These are composed chiefly of compound ethers, which possess the odor and flavor of certain fruits. Here are formulas for the special flavors you desire:

Extract Pineapple—

(1.) Deodorized alcohol..... 500 parts.
Diluted alcohol..... 200 parts.
Pure pineapple juice..... 190 parts.
Pineapple ether..... 100 parts.
Tincture vanilla..... 10 parts.
Color with tincture curcuma.

(The pineapple ether in the above is thus made: Alcohol, 400 parts; concentrated essence of pineapple peel, 400 parts; butyric ether, 120 parts; sebacic ether, 40 parts; acetate of amyl, 10 parts; butyrate of amyl, 10 parts; acetic ether, 10 parts; extract of vanilla, 10 parts.)

(2.) Deodorized alcohol..... 60 fl. ounces.
Pure pineapple juice... 20 fl. ounces.
Butyrate of amyl..... 10 fl. ounces.
Butyric ether..... 5 fl. ounces.
Glycerine..... 3 fl. ounces.
Chloroform..... 1 fl. ounce.
Aldehyde..... 1 fl. ounce.

(3.) Butyric ether..... 1 fl. ounce.
Alcohol 1 pint.
Turmeric, enough to color.

Extract Raspberry—

(1.) Deodorized alcohol..... 500 parts.
Diluted alcohol..... 200 parts.
Pure raspberry juice..... 170 parts.
Raspberry ether..... 100 parts.
Tincture of orris..... 20 parts.
Triple extract of rose.... 10 parts.
Color with tincture of alkanet.

(Raspberry ether is made of alcohol, 400; concentrated essence of raspberry, 400; tincture of orris, 80; acetate of amyl, 75; chloroform, 15; triple extract of rose, 10; oenanthic ether, 10; acetic ether, 10.)

(2.) Butyric ether..... 60 drops.
Acetic ether..... 40 drops.
Spirit nitrous ether..... 10 drops.
Glycerin..... 10 drops.
Alcohol..... 2½ fl. ounces.
Alkanet, q. s. to color.

A simpler and perhaps better way of preparing this is by adding to a strong tincture of orris root a small proportion of acetic ether.

Extract of Strawberry—

(1.) Deodorized alcohol..... 500 parts.
Diluted alcohol..... 200 parts.
Pure strawberry juice... 140 parts.
Strawberry ether..... 100 parts.
Pineapple ether..... 45 parts.
Tincture of orris..... 10 parts.
Tincture of vanilla..... 5 parts.

Color with tincture of alkanet and saffron.

(Strawberry ether: Raspberry ether, 840; pineapple ether, 150; tincture of orris, 5; extract of vanilla, 5.)

(2.) Butyric ether..... 50 drops.
Acetic ether..... 50 drops.
Spirit nitrous ether..... 20 drops.
Glycerin..... 20 drops.
Alcohol..... 2½ fl. ounces.
Alkanet, enough to color.

Another limitation may be made by adding to a weak solution of butyric ether in alcohol a very small proportion of oil of cloves.

5985. Gelatine Pill Coating.

(G. A.) Several formulas have been published for a gelatine solution for this purpose. Hager's formula for extemporaneous coating consists of 2 parts of white gelatin and 5 parts of distilled water, melted with the aid of a water bath. When material for gelatin coating is to be kept on hand, 10 parts of white gelatin, 25 parts of distilled water, and 6 parts of 90 per cent alcohol are used, and after mixture by means of a water bath, allowed to cool, when it forms a jelly. As much as may be needed of this mixture can afterwards be melted with a water bath. To use either of these solutions, the pills are one by one stuck upon a pointed wire, and are dipped into the solution with care not to immerse the wire; the wire with the pill is to be twirled about for a few moments, and then stuck upright into a pin-cushion, vessel of sand or a piece of bread. When all the pills are coated they may be removed from the wires.

Another and more expeditious way is to put about 20 drops of the warm gelatin into a warm porcelain capsule, then add 60 pills, shake them about until they are all moistened, and then distribute them about on waxed paper as quickly as possible and allow them to dry for a couple of hours. The aid of an assistant in distributing them is desirable in order that it may be done quickly.

Dr. Symes' formula for gelatin coating consists of French sheet gelatin, 4 parts; water, 16 parts; glycerin, 1 part. Melt with the aid of heat. A board is required into which pills have been pressed so that the points project some distance, and it saves time to have another board with depressions corresponding to the pins, in which the pills to be punctured can be held. The points of the pins, having been greased, are made to puncture the pills, and then, any scum on the coating solution having been removed, the pills are dipped and then rotated to insure an even coating until the coating has set.

Dimock advises 6 drams of Cox's gelatin and 1 dram of granulated gum arabic to be dissolved in 14 drams of No. 8 acetic acid with the aid of a water bath; add 1 ounce of spirit of nitrous ether and 5 minims of oil of gaultheria, and mix. Make the pill mass a little softer than usual; use as little powder as possible in rolling, and when the pipe is nearly long enough for cutting, lay in front of it a thread long enough to reach over the sides of the pill machine, or cut a slit along the pipe and lay the thread in this. Roll to full length and cut the pills, which can then be kept strung on the thread like beads. Holding each end of the thread, shake off any adhering powder, and then dip the pills into the coat-

ing solution; twirl the thread so as to throw off any excess of solution, and hang the pills up to dry by pinning the ends of the thread to opposite sides of a box. When the coating is dry the thread can be cut close. Some practice is needed to insure good and speedy results by this method.

The Chemist and Druggist gives the following variation of this method: Into the end of a bottle cork stick a dozen needles so that the points will diverge and stick a pill onto each point. A mixture for coating is to be made of 4 ounces of French gelatin, 1 ounce of gum acacia, 2 drams of boric acid, and 40 ounces of water. Macerate the gelatin and the acacia in the water for 12 hours. Dissolve with the aid of a water bath, add the boric acid, and strain through muslin. A sufficient quantity of this stock mixture having been melted, the corkful of pills is to be dipped, withdrawn and held for a moment to allow excess of coating to form drops. These may be removed by allowing each one to touch the surface of the liquid, after which the cork should be twirled for a few moments and then set aside to allow the coating to harden.

Patch says that the following is found by him to be most generally suitable: Best French, gold-labeled gelatin, 2½ ounces avoirdupois; distilled water, 7 fluid ounces. Macerate until gelatin softens, dissolve by water bath, add powdered boric acid, 2 drams, then slowly add mucilage of acacia, 2 fluid ounces, and strain. He also makes the following practical comments:

"Much of the success of the process depends upon having the solution of proper density; the thinner it is the better, providing it gives a firm and complete coating when dry. The warmer the solution the more rapid will be the drying; but judgment must be used in regulating the temperature in each case, for if too warm it may soften and destroy the form of the pill, or in cooling the gelatin may contract and split or crack. Pills consisting largely of aloes, gum, resins or solid extracts should be made very hard and dipped into a thin, comparatively cool solution. If dipped in too warm a solution the pills will soften, and when the gelatin contracts it will cause the softened mass to protrude from the needle hole.

"Pills containing carbonate of ammonium, citrate of iron and other scaled salts, valerianates, acetates, alkaline iodides, etc., should be dipped in a cool solution. Glycerin should be avoided as an excipient owing to its tendency to soften the coating. Glucose forms a good general excipient for pills to be gelatin-coated, and may be used alone with quinine or with a little powdered extract of licorice for dark pills. A mixture which thickens by keeping should have a little distilled water added from time to time. A pad saturated with petrolatum should be provided into which the needles may be thrust to grease them before they are inserted into the pills. The needles should be thrust only so far into the pills as to hold them securely, and the pills should be immersed into the coating mixture just far enough to cover them. Excess of coating mixture may be removed by touching the pills to the underheated surface of the cover of the container (or to the surface of the heated mixture)."

5086. Qualitative and Quantitative Tests for Glucose.

(O. P.) The ordinary methods of detection and estimation of glucose depend upon its reducing power. Fehling's solution, a formula for which may be found in the last edition of the Pharmacopœia, is in common use both as a qualitative and quantitative test for glucose. It is a solution of 34.61 grams of pure crystallized copper sulphate, 173 grams of litmelle salt, and 80 grams of sodium hydrate in a litre of distilled water. One cubic centimeter of this solution is exactly reduced and decolorized by 5 milligrams of glucose. For qualitative detection, various reagents may be used. Here are some of them:

1. Boettger's.—Heat the solution containing the glucose with a solution of sodium carbonate in presence of subnitrate or hydrated oxide of bismuth. Glucose reduces the bismuth salt to a gray or blackish bismuthous oxide.

2. Braun's.—A solution of glucose heated to 90° C. in presence of a little solution of soda, mixed with a solution of picric acid, boiling finally. Blood-red color.

3. Campan's.—Add a mixture of a concentrated solution of subacetate of lead with a dilute solution of acetate of copper. Yellow to orange precipitate.

4. Hager's.—To 30 grams red oxide of mercury and 30 grams of acetate of sodium add 25 grams of picric acid, 50 grams chloride of sodium and 400 grams of water; after solution dilute up to 1 litre. Add of this test solution an excess to the liquid to be tested. Separation of mercurous chloride.

5. Heinrich's.—Dissolve 18 grams of iodide of mercury and 25 grams iodide of potassium in water, add 10 grams potassa, and water up to 1 litre. When heated with glucose there is a reduction.

6. Loewenthal's.—Sixty parts of tartaric acid, 240 parts carbonate of sodium, 5 parts crystalline ferric chloride and 500 parts hot water. Gives a brown precipitate on boiling with glucose.

7. Moore's.—Turns brown on heating with 3 or 4 per cent of caustic potassa, and evolves an odor of caramel on boiling an acid in excess.

8. Mulder's.—Boll with a solution of indigo (sulphindgotate of potassium), adding gradually a solution of carbonate of sodium. The blue color is discharged (turns green and red).

9. Pellgott's.—Solubility of lime. Make two assays of the lime, one with the cold solution and the other with the boiled solution (boiling destroys glucose). The difference between the assays equals the glucose (quantitative).

10. Schmidt's.—Glucose gives a red color when boiled with an ammoniacal solution of acetate of lead.

For the determination of glucose alone, Fehling's solution affords the most accurate means. In the absence of any other optically active body, examination with the polariscope will also suffice. The determination of commercial glucose, which is likely to be a mixture of dextrose, maltose and dextrine, is a problem of considerable difficulty. Three methods have been proposed:

The first, by Allen, requires the determination of moisture and ash in the sample, which, subtracted from 100, leaves the total organic solids, 0. The apparent specific rotary power, S, and the cupric oxide reducing power (in terms

of dextrose reduction—100), K, are now determined. Then if M be the maltose, G the dextro-glucose, and D the dextrine, Allen determines the respective percentages by the use of the formulas

$$M = \left(\frac{S - 52.7K}{100} + 0.314 \right) G - K - .62M, \text{ and } D = 100 - (G + M).$$

The author states that the presence of gallisin or other unfermentable sugar may vitiate the values of K and S, as observed, and so make the results inaccurate.

The second method is that of Wiley, which is based upon the theory that boiling in an alkaline solution of mercuric cyanide will destroy the optical activity of maltose and dextrose, leaving that of dextrine unchanged. The cupric oxide reducing power of the sample is ascertained in the usual way by Fehling's solution. The specific rotatory power is determined by polarizing a 10 per cent solution (previously heated to boiling) in the ordinary manner. Ten cubic centimetres of this solution used for polarizing are then treated with an excess of an alkaline solution of mercuric cyanide, and the mixture boiled for 2 to 3 minutes. It is then cooled and slightly acidulated with hydrochloric acid, which destroys the reddish-brown color possessed by the alkaline liquid. The solution is then diluted to 50 cubic centimetres, and the rotation observed in a tube 4 decimetres in length. The angular rotation observed will be due simply to the dextrine, the percentage of which may then be calculated by the formula

$$\left(\text{Rotation} \times 1000 \times c.c. \text{ of solution polarized} \right) \div (R \times \text{length of tube in centimeters} \times \text{weight of sample taken}) = \text{percentage of dextrine.}$$

The percentages of dextrose and maltose may be deduced from the reducing power of the sample, or from the difference in specific rotatory power before (S) and after (s) the treatment with alkaline mercuric cyanide.

$$\text{Thus, } K = 1.00g + .62m, \quad S = .527g + 139.2m + 1.58d, \quad \text{whence } m = \frac{S - K - 52.7K}{1.0524}.$$

g can now be found from the first of the three equations, and then d in the second.

The third method of estimating the constituents in commercial glucose is due to C. Graham, and is probably more exact than either of those before mentioned. Dissolve five grammes of the sample in a small quantity of hot water and add the solution drop by drop to 1 litre of nearly absolute alcohol. Dextrine is precipitated, and on standing becomes attached to the sides of the beaker, while maltose, gallisin and dextrose are soluble in the large quantity of alcohol employed. If the solution be then decanted from the precipitate, the dextrine in the latter can be ascertained by drying and weighing, or by dissolving it in a definite quantity of water and observing the solution, density and rotation. The alcohol is distilled off from the solution of the sugars and the residual liquid divided into aliquot portions, in one of which the gallisin may be determined after fermentation with yeast, while the others are employed for the observation of the specific rotation and reducing power, which data give the means of calculating the proportions of maltose and dextrose in the sample.

STRONG, COBB & CO., CLEVELAND, OHIO.

NEWS COMMENT.

A first-class new drug store will be opened by Chas. L. Kellogg, in Oconoco woc, Wis., about February 15.

The first bill passed by the Iowa legislature was one exempting registered pharmacists from jury duties.

J. J. Shuster, druggist of Loveland, O., has been visited by fire, his stock being damaged to the extent of \$1,000.

Ever risked everlasting torment for just one mean little apple, because Satan told her it was good for the complexion.

Arthur Lyman has been admitted to membership in the firm of Lyman Sons & Co., wholesale druggists of Montreal.

Druggist Goldwater, of Mt. Vernon, N. Y., puts up prescriptions free for poor people who bring orders from the relief association.

This is the way to start a patent medicine business. A new corporation in Portland, Me., has been capitalized with \$1,000,000 stock, of which \$125 is paid in.

A corporation lately come into existence is the Minnesota Drug and Chemical Co. of St. Paul. The capital stock is placed at \$50,000, with a debt limit of \$10,000.

The Burrough Bros. Manufacturing Co. has been incorporated in Baltimore, Md., with a capital stock of \$100,000. The company will manufacture chemical and pharmaceutical preparations.

Chas. J. Daubach, well known to Nebraska druggists, being the secretary of the H. C. Clarke Drug Co. of Lincoln, fell from a street car a few days ago and dislocated his shoulder, fracturing the bone.

The suit brought by a Mrs. Wright against druggist E. Soper, of St. Joseph, Mo., charging him with a mistake in selling her a poisonous drug instead of dandelion, is still dragging its weary length along, with the end not yet in sight.

The druggists of Amsterdam, N. Y., are engaged in discussing cut rate prices in patent medicines. They have also decided that they will meet the cut rate prices and now lively competition in the drug trade is looked for.

The H. G. Hotchkiss International Prize Medal Essential Oil Co. has been incorporated at Lyons, N. Y., and will engage in the distillation and refining of peppermint oil. Lyons is situated in Wayne county, one of the largest peppermint producing districts in the country.

Druggist H. S. Moore, Schenectady, N. Y., sends us a 50-page illustrated pamphlet descriptive of that city, its business men and industrial importance. The distribution of this publication by Mr. Moore is but one of the many wideawake ideas he has for pushing his business.

Druggist J. M. Johnson, of Hudson, N. Y., is likewise postmaster in that town. Early this month burglars visited his place of business and broke into the safe, securing some \$3,600 in valuables, \$200 of which was in cash. Mr. Johnson says if sand and money will catch the thieves they will be caught.

Burglars entered the drug store of E. Belleene at Stockholm, Wis., last month, but were frightened away by a couple of young men who were sleeping in the store. A little revolver practice on both sides, one of the burglars slightly wounded, but all escaped.

Munyon's Homeopathic Home Remedy Co. received an order on the 2d inst. from the Smith, Kline & French Co. for \$1,000. This is the largest order ever placed by any wholesale drug house for goods of this description.

Webber's Pharmacy is the new sign over the door of the Schenectady drug store recently owned by George Gertzen, deceased. The new proprietor is a graduate of the Albany college and for a number of years was employed by Geo. E. Duryce. A new Low Art Tile fountain is an attraction of the store.

A druggist of Oskaloosa, Kas., convinced of the error of his ways, through attending a Methodist revival, has abandoned the sale of all liquors, but being of a thrifty turn of mind, he shipped back a lot of beer he had ordered before his conversion rather than pour it into the street as do some real reckless, extravagant fanatics.

W. H. Scheffelin & Co. are claiming that the Phena Trocine Co. of Philadelphia are infringing upon their trademark and have notified them to discontinue or stand a suit. The Philadelphia firm state there is no ground for the complaint, and are prepared to contest any effort to stop their business.

Salt Lake City had a drug store fire a few days ago, the house of Layman & Co. being entirely consumed. The insurance companies sustaining losses investigated the circumstances of the fire, and advised recalling of all policies. A compromise settlement is likely to be offered by the companies, and if not accepted by the insured, a legal contest will ensue.

The courts of San Francisco, Cal., are called upon to decide the question of royalty on the I. X. L. Bitters and a formula for celery, beef and iron as a tonic. The plaintiff is the widow of the late Dr. Henley, who claims that she is entitled to a royalty on all business done in them. The Manufacturing Drug Co. claim that they own the formula themselves and that no royalty is due.

Druggist A. Nattans, in Washington, D. C., has paid \$400 assessed against him for selling liquor illegally. He had a certain Golden Fruit Tonic which was very popular with the rouders, but the judge did not believe the statement that it was a medicinal article pure and simple, for a bottle of the stuff bought proved to be nothing but whisky, though the bottle produced in court in the defense was entirely another thing. The manufacture of the article has ceased and the fine been paid.

About five years ago H. A. Kerste opened a drug store at Schenectady, N. Y., with a small stock of drugs and chemicals. He has been successful beyond all expectation and recently has erected a handsome three-story brick block which will be occupied February 15 by the owner. The stores are finished throughout in quartered oak, the lighting on all floors is by electricity, steam heat is employed and the various fixtures are of most approved modern pattern, material and finish. The soda fountain is from J. W. Tufts and the canopy top is furnished by the New York Store Fixture Co., who also supply the shelving. Whittall, Tatum & Co. are the makers of all the glassware employed and the show globes come from Porter Farley, of Rochester.

Alfred Gribner, a San Francisco druggist, has been arrested for personating a detective and obtaining money under false pretenses.

Low Art Tile Fountain have recently been sold to A. S. Letourneau, Fall River, Mass.; G. W. Oate, Fall River, Mass. Changes in fountains: E. A. Bowers, Malden, Mass.; D. Kimball & Co., Portsmouth, N. H.; S. J. Briggs & Co., Providence, R. I.; A. W. Fenner, Jr., Providence, R. I.; J. I. Street, Malden, Mass.; C. H. & H. A. Lawton, New Bedford, Mass.; J. F. Lang, Everett, Mass.; J. H. McCorrison, Campbell, Mass.; G. S. Russell, Easthampton, Mass.; P. F. Whalen, Webster, Mass.; P. V. Joyce, Ballardvale, Mass.; W. I. Jones, Framletown, N. H.

A. P. A. SPECIAL MEMBERSHIP COMMITTEE.

A new departure was inaugurated at the last meeting of the A. P. A. in Chicago when the president of that association was instructed to appoint a special membership committee consisting of one member from each state and territory, whose duty would be to solicit applications for membership from druggists in their respective sections of country. The committee will act under the direction of the chairman of the Council, J. M. Good, St. Louis, and the chairman of the committee on membership, Chas. Caspari, Jr., Baltimore. The committee is composed of the following gentlemen with Florida, South Carolina, Washington state and North Dakota yet to be heard from.

Alabama, Phillip C. Candida, Mobile; Arizona, Clemens L. Eachment, Phoenix; Arkansas, Wm. W. Kerr, Russellville; California, Wm. M. Searby, San Francisco; Colorado, Chas. S. Kline, Denver; Connecticut, Chas. A. Rapelye, Hartford; Delaware, John M. Harvey, Wilmington; District of Columbia, Samuel L. Hilton, Washington; Georgia, Henry R. Black, La Grange; Idaho, Albert O. Ingalls, Murray; Illinois, T. H. Patterson, Chicago; Indiana, Josiah K. Lilly, Indianapolis; Iowa, Mrs. Rosa Upon, Marshalltown; Kansas, Mrs. M. O. Miner, Hiawatha; Kentucky, Wiley Rogers, Louisville; Maine, Edward A. Hay, Portland; Louisiana, Alex. K. Finlay, New Orleans; Maryland, D. M. Culbreth, Baltimore; Massachusetts, W. L. Scoville, Boston; Michigan, Arthur S. Parker, Detroit; Minnesota, James C. Hening, Stillwater; Mississippi, John C. Means, Natchez; Missouri, H. M. Whelpley, St. Louis; Nebraska, James Reed, Nebraska City; Nevada, William A. Perkins, Virginia City; New Hampshire, Andrew P. Preston, Portsmouth; New Jersey, Wm. C. Alpers, Bayonne; New Mexico, James A. Kinneer, Deming; New York, Caswell A. Mayo, New York City; North Carolina, Henry H. Cheers, Plymouth; Ohio, Louis C. Hopp, Cleveland; Oregon, Geo. C. Blakely, The Dalles; Pennsylvania, Prof. Frank G. Ryan, Philadelphia; Rhode Island, Henry J. Alfreds, Providence; South Dakota, Irvin A. Keith, Lake Preston; Tennessee, James O. Burge, Nashville; Texas, L. Myers Conner, Dallas; Utah, Frank A. Druehl, Lake City; Vermont, Henry A. Chapin, Brattleboro; Virginia, Edmund R. Beckwith, Petersburg; West Virginia, Edwin L. Boggs, Charleston; Wisconsin, John A. Dadd, Milwaukee; Wyoming, Thos. G. Maghee, M. D., Rawlins; Quebec, Seraphin Lachance, Montreal; Nova Scotia, Francis C. Simson, Halifax; Ontario, John Lowden, Toronto.

STRONG, COBB & CO.

Cleveland, the Ohio metropolis, has long been the dominant factor of the Buckeye state in wholesale drugs and chemicals, paints, oils and varnishes. To attain to such a prestige comparatively but few years were required. Evolution was rapid, brains, vim and ambition being its underlying strata. When Cleveland's pioneer citizens made that memorable rush for commercial recognition, Samuel Merwin Strong was abreast of the avalanche. Mr. Strong was a country boy. Born at Amherst, in Lorain county, in 1832 his educational advantages were necessarily narrow. Yet, after graduating from the Berea schools he gained admission to Oberlin College, more through a liberal self-tutorage than Berea pedagogy. At the age of 18 he was apprenticed to an Elyria druggist, with whom he remained one year. With his first savings of \$100 and a great deal of ambition he drifted to Cleveland, in 1851, and entered the employ of J. D. Hayward, also a druggist—for pharmacy had become his fixed aim in life—but Mr. Hayward retiring in 1853, our subject transferred his activity to the wholesale and retail drug house of Gaylord & Co. In 1855 he engaged in the manufacture of what became a popular remedy, "Dr. Samuel Strong's True Fever Destroyer." Three years later he, in company with A. C. Armstrong, purchased the wholesale business of E. F. Punderson, or Henderson & Punderson, whose origin dates back to 1833. This firm remained in business for about fifteen years, when, in 1872, the present company was organized. Thus it will be seen that S. M. Strong's career, although marked by vicissitudes, or rather, interruptions, is a straight and gallant line to what he aimed at. Its progressive stages are so well defined as to afford a subject for pleasant contemplation and a deep sense of admiration and plaudit. In the history of Strong, Cobb & Co. the only setback was the fire in 1881, when about \$40,000 worth of damage was done. Yet this never for a day clogged the wheels of progress.

S. M. Strong has always remained at the head of the house, and he is looked up to as the father, the maker of it all. When the National Wholesale Druggists' Association was organized in 1876, S. M. Strong was chosen its treasurer. He is its treasurer to-day—another evidence of characteristic constancy, which is a glorious tribute to his integrity and fitness. While a model business man, Mr. Strong is also a leader in society. Though retiring and modest, he has had many public honors thrust upon him. Recently, as a director of the Chamber of Commerce, he again proved his high character as a citizen, and a lover and promoter of all things Clevelandish.

Of the other members of the firm of Strong, Cobb & Co., Lester A. Cobb was admitted to partnership in 1870. Born in Birmingham, O., in 1850, he received his education in Cleveland schools. When old enough to choose his own career he entered S. M. Strong's employ as a traveling salesman, continuing until he was promoted to the management of the sales department. Of late Mr. Cobb's attention is partly given to his father's estate, of which he is the executor. While seldom seen at the company's office, Mr. Cobb retains a live interest. His name is coupled with several large industrial home enterprises which arrest his immediate attention.

PREMISES OF STRONG, COBB & CO.

Ralph L. Cobb was, like his brother, born in Birmingham, O., but is six years his junior. After finishing his education in Cleveland he eventually adopted his brother's career. This was in 1875. True to the life plan of his superiors, he started from the bottom of the ladder. After several years of assiduous application he was placed at the head of the sundry department, which position he now nominally holds. He devoted his entire attention to the interests of the company. For eight years he was the treasurer of the Cleveland Pharmaceutical Association.

Edwin L. Strong, son of the senior member of the firm, came to this world in 1860. He was educated in Michigan University, and at the age of 18 was given employment in his father's business. Edwin was a bright and attentive boy, and soon developed the traits inherited from his brave elder. With the exception of a short interval, when he put his agricultural by-instincts to a practical test at cattle raising in New Mexico, all of his business life had been given to the furtherance of the company's interests at home and abroad. He fills the position of general manager, and is apparently the right man in the right place. At the last election of the C. P. A. officers he was chosen treasurer.

Samuel E. Strong, while not as yet admitted to a partnership, deserves due representation in this sketch. "Sam" the younger is what the old weatherbeaten Cuyahogans term a chip from the old block. Coincidentally it may be remarked that the ages of the Strong brothers are as far apart as those of the Cobbs—six years. Samuel was educated at Andover, Mass., and at the age of 20 espoused his brother's calling. After going through the several stages of what constitutes a drug man's training on the high standard set by his father, he was given the most important position within the company's gift, that of managing buyer, and this he fills with grace and alacrity in the traveling man's eye and with credit to himself and the company.

The accompanying illustration gives but an inadequate idea of the company's premises. In all 77,000 square feet are utilized by the business. The Superior street facade building, known as the Cobb & Bradley block, one of the finest on the street, is five stories high and extends to Long street. The basement is given to sponges and liquor. On the first or office floor are found the sample and sundries department; second floor, order department; third floor, corks and

glassware department; fourth floor, patent medicine department; fifth floor, light drugs department. The Long street building is connected by a tunnel and bridge, and is also five stories high. The basement is fitted up with all manner of modern grinding apparatus. On the first floor paints and varnishes are stored; the second floor is the packing and shipping department; the third, the laboratory; the fourth and fifth are stock rooms. Adjoining the building is the company's capacious warehouse.

Besides these departments the company carries a large and complete stock of cigars, which department is in charge of Perrin Sherley. The following gentlemen have charge of the other classified departments: Paints and brushes, J. E. Tyler; liquor, H. M. Dillhoefer; sundries, Ralph L. Cobb (nominal), Howard Brown (active); laboratory, O. B. Hannon. From 100 to 125 men are on the pay rolls, and the traveling men cover a wide space of territory. The memorable depression of 1893-94 did not impede the progress of and expansion of the business in any phase, materially speaking, no more than the war and the panicky times of '73 dwarfed its healthy evolution. This is in a measure due to the company's thrift, circumspect go-aheadativeness, experiments along modern lines and, last, but not least, to liberal resorts to printers' ink.

The Minnesota Drug & Chemical Co. is a newly incorporated concern at St. Paul with a capital stock of \$50,000.

The differences between the Milwaukee, Wis., retail druggists and the telephone company noted before in these columns, have been adjusted. It is said that forty-eight druggists in that city are using the automatic pay-every-time-you-talk telephone and are satisfied with it. These gentlemen seem to think it to their advantage to use this kind of a phone, hence it is not likely the druggists' association will take further action.

They make large morphine pills over in England's North American provinces, if we can believe recent newspaper statements. A policeman in Calgary, Manitoba, is said to have taken six pills of eight grains of morphine each and death resulted. The jury brought in a verdict in accordance with the facts and censured the druggist for selling morphine without sufficient directions and cautions. Eight-grain pills of morphine would be quite a curiosity in stores in the states.

NEW YORK.

New York, February 19.—Mr. George J. Seabury, of Seabury & Johnson, has sent his resignation from the National Wholesale Druggists' Association to the officers of that organization. This, it is believed, is the first resignation since the N. W. D. A. was organized at Indianapolis in 1877. Everybody in the trade wants to read Mr. Seabury's letter of resignation, and the president and secretary of the association are requested to make the letter public.

Brooklyn druggists and physicians are mad clem through over the actions of the N. Y. and N. J. Telephone Co. For some time past an attempt has been made by the company to force druggists to place pay telephones in their stores and thus become the servants of the company. If a druggist declined to allow his store to be used as a pay station his telephone was immediately ordered out. These high-handed proceedings have aroused the druggists and on Tuesday next a meeting will be held at Brooklyn College, 39 Clarkson avenue, to take action in the matter. The interest physicians have in the subject is best described by druggist Thomas J. France, of 616 Myrtle avenue, Brooklyn, who says in a card addressed to the medical profession:

"The manager, Mr. Sargent, declared to me on January 8 that physicians, although subscribers, had no right to use the telephone in my store, stating at the same time that they had the same right to pay for the use of the telephone as the public, as they were paid for their services. He forgets to explain that while the physician receive but one fee, the company charge for two. He seems also to forget or probably he does not know that the physicians and the druggists were the main support of the telephone company during the first three years of its existence. Now he proposes to take the company's old patrons, the druggists whose contracts have expired, by placing "pay stations" in their stores to draw from the pockets of the physicians and their customers for the benefit of the telephone company. Although I offered the company an increased rental, Mr. Sargent had the telephone removed from the store on January the 9th."

The Dehamme-Deletere Brush Co., of Murray street, report business as considerably better than they have found it for the past four or five months. "The reason for this," said a representative of the firm, "is that when the brush schedule in the pending tariff bill was last changed the duty was made 35 per cent instead of 25. We now pay 40. This 5 per cent difference makes a change in selling price of about 3 per cent, not sufficient to cause the trade to hold back orders."

H. B. Platt may be seen at the Fulton Club any day at noon, full of good humor and luncheon.

A sub-station of the postoffice has been established at Neergaard's pharmacy, Fifty-third street and Sixth avenue.

Druggist Allen, who used to be located at Seventeenth street and Second avenue, is to open a new store at Millbrook, N. Y.

Dr. Gill's drug store in Mt. Vernon was one of the sixty stores and houses in that city railed by burglars during the past four weeks.

John Caswell, of Caswell, Massey & Co., has been duck shooting at Barnegat Bay. As usual, he was quite successful. He returned to town in time for his daughter's marriage.

Among the druggists fined recently for violations of the pharmacy law were Fred J. Stock-William T. Cox, George

Hoskinson, John O'Conner and Fred Kleinschmidt.

Mr. B. M. Douglass, western representative of the firm of Hane & Co., has returned to Chicago by way of Canada, stopping at Montreal and Toronto. This week Mr. Douglass goes to California.

George T. and A. L. Cochran, formerly of No. 97 Pearl street, are going to open a drug store near Battery Park. They have been furnishing ships with medical supplies and will run their drug store in connection with that business.

Wm. P. Halsey, vice-president of the Tilden Co., in charge of their St. Louis house, has been east on a visit for the past three weeks. On his return to St. Louis he stopped over at Quebec to enjoy the pleasure of the ice carnival.

The statement in the January 15th Era that druggist Geo. B. Wray, of Yonkers, had purchased a new Tufts fountain needs correction. The apparatus was made by A. D. Puffer & Sons, of Boston, is "colonial" in effect and was made after special designs.

That historic old inn, the "Century," on William street, seems to be just as popular as ever with drug trade men. While there the other day I was told that one customer had patronized the place for nearly thirty years. The J. W. Johns people are frequently seen there.

Isaac O. Woodruff, the druggist at 88 Maiden Lane, claims that the suit now being pressed against him by Ithamar Howe for the alleged alienation of the affections of Howe's wife, is a blackmailing scheme. Mr. Woodruff is one of the oldest druggists in this city, having been in the business here since 1859.

"For this time of the year," said a gentleman in the wholesale trade, "business is better than we have any right to expect. The promise of continued good business given by a spurt in January was not only broken, but broken badly at the end of that month. Perhaps that is the reason why the present depression is so severely felt."

H. L. Ford, who for the past eight years has had charge of the business affairs of the New York and Chicago Chemical Co., has severed his connection with that company to devote his attention to private interests. Arthur S. Winslow, who has been connected with the company for nearly five years, has succeeded Mr. Ford as treasurer and general manager.

A popular and successful business man of Brooklyn was Charles R. Paddock, who died February 7 at his home, 287 Clermont avenue. He was for twenty years a druggist in the city of churches, had two stores and had filled the president's chair of the Kings County Pharmaceutical Society for two terms. His death will be a severe loss to the profession in Brooklyn.

John W. Cox, one of the proprietors and vice-president of the Antikamnia Co., of St. Louis, has been absent from this city for about two weeks. He attended the directors' meeting in St. Louis and reports business very good. It was noted that Mr. Cox's return and the French ball were coincident, so it is rumored that he hurried home in order to attend the function.

H. B. Mason, son of Secretary Mason, of Seabury & Johnson, who has been doing efficient city work for that firm, sails for Europe to-day to accept a position with a London house. His friends will probably not see him again for a couple

of years. He severed his connection with Seabury & Johnson on Friday, receiving the hearty well wishes of everybody in the firm's employ.

Another point of special interest to the retailer was brought out in conversation with a delegate to the Interstate League meeting. What does it cost a retailer to sell a dollar's worth of goods? Does it actually cost him, say thirty-three cents, for every dollar taken in? How many druggists know what it does cost them? And it's a very pretty sum that many up-town druggists are paying now or have recently paid for the fixtures in their stores.

Van Horn & Ellison, the druggists at the corner of Park avenue and Forty-first street, made the chemical tests for arsenic and antimony on the contents of eighty-four vials of drugs found in the possession of Dr. Meyer, the alleged poisoner brought here from Detroit. The firm put in a bill for \$1,680, which Dr. Charles Rice, chemist for the department of charities and corrections, reported as excessive. Van Horn & Ellison will have to sue the city for their money or else accept about one-half of the amount asked.

Several gentlemen in the drug business are actively interested in the welfare of Amalfian Encampment, No. 12, G. R. A., Knights of St. John and Malta. Among others are Messrs. Alonzo A. Dargan, city salesman for Tarrant & Co.; Charles Bruhl, suburban shipping clerk for Lehn & Fink; Arthur J. Green, city shipping clerk for the same firm, and T. B. Eren, the druggist at the corner of Seventh avenue and 135th street. The encampment gives an entertainment at Washington Hall, 2107 Seventh avenue, on Tuesday evening, February 20.

Howell & Sangston, agents for the Low Art Tile Co., at No. 31 Church street, report business as being very encouraging. They have just put in a handsome fountain at Neergaard's pharmacy, Fifty-third street and Sixth avenue. It is one of the five-foot fountains, with tile and mirror top. Another example of their work will be seen in Tomas's drug store, at Sixty-fifth street and Columbus avenue. Tomas's store is to be one of the finest above Twenty-third street. Russell & Lawrie's new drug store at Tarrytown and Brownell & Low's at Orange, N. J., have received their fountains from Howell & Sangston.

Among others who secured a taste of notoriety during the past week were Joseph Bernard, of the drug firm of Leo Bernard & Co., Richard Klock, a druggist, and Edward Roxbury, clerk in a Third avenue drug store. Bernard was examined in supplementary proceedings growing out of his wife's penchant for charging goods to him after he had ordered the stores not to fill orders on account. Klock was accused of theft. Roxbury was called upon to go to Bellevue hospital and see a woman who had attempted suicide because she loved him. She didn't die, so there was at least one drug clerk who was happy this week.

Messrs. Fraser and Peters, of the Fraser Tablet and Triturate Manufacturing Co., of 17-27 Vandewater street, entertained a number of their salesmen who were in town at a dinner served at the Arena, on Thirty-second street, a few nights ago. The affair was quite informal. Covers were laid for ten persons, and after dinner the salesmen gave some

interesting descriptions of their experiences on the road. They will all be out "on the road" again in a few days, but they won't forget that good time at "Muschenheim's." G. S. Stoddard, of the Fraser Co., says, and he knows, that business is first-class and still gaining. Collections are better than for two years past.

Miss Elizabeth H. Caswell, the only daughter of Mr. John R. Caswell, of the Fifth avenue firm of Caswell, Massey & Co., was married to Mr. Edward M. Riley, of the Ninth National Bank, last Tuesday night. The wedding took place at the home of the bride's parents, No. 1690 Broadway. The ushers were William M. Massey, T. A. H. Weinz, A. W. Coe and David Costello. At the reception which followed many guests wished the bride and bridesroom all happiness. Among those who presented congratulations were Mr. Samuel W. Fairchild, Mr. Benjamin T. Fairchild, Mr. and Mrs. George Massey, Mr. and Mrs. P. J. Willemann and Mr. and Mrs. J. G. Albro. Mr. and Mrs. Riley are now in the south.

There is so much written and said nowadays about polypharmacy that the following prescription, handed to a Harlem pharmacist for compounding, will prove interesting, probably, to many readers of the Era.

Infusum achillea millefolii, infusum salvia, 15.0; aqua 2 ounces; tinctura croci, 1 dram; tinctura sassafras, 1 dram; tinctura vanillae, 5.0; aqua cinnamonoli, 1-2 fl. ounce; tinctura aloes composita 3 drams, oleum juniperi 2.0; oleum chamomille, aeth. 2.50; tinctura asafetidae, 1 dram; tinctura valeriana, aeth. 15.0; tinctura amaræ, 10.0; tinctura rhei, 2 drams, tinctura strychnina, tinctura selsamii, 1 dram; oleum sabinae 2.0; syrupus hypophosphitum cum morrhuae 1-2 ounce; tinctura castoreum 15.0; celerina 1-2 ounce; tinctura belladonna 5.0; extract. canadensis, fl. extractum secale cornutum, of each, 15.0. M. ft. D. 20 drops four times a day after meals.

Men seldom speak well of their own business, it is said, yet it hardly seems right for a retail druggist to accuse his fellow-retailers of being the most narrow-minded men in the world. A Fifth avenue retailer told your correspondent the other day that he believed such to be the case. "Most druggists," he said, "never look around the corner." He meant by that that they were so absorbed in their routine of labor that they disregarded what goes on in their own line of business outside of their particular office. The same sentiment was voiced at the meeting of the Interstate Druggists' League on Tuesday. One of the hits of the day was made by a druggist from up the state who characterized many men in his business as being "able to look with both eyes into a jug." He thought the average retailer looks all the time in one direction. "A lecture more broadening is what we need," he said.

COLLEGE OF PHARMACY OF NEW YORK.

There is much of interest going on at the College of Pharmacy these days. In the first place there is the hottest kind of a time in the senior class over the class valedictorian matter. The seniors received a week or two ago not to have any valedictory delivered at the commencement exercises which are to take place on April 26. This most unusual resolve has split the class into two factions and caused no end of talk among the alumni. Those seniors who put through the resolution claim that valedictory ad-

resses are out of fashion and that this senior class should show itself up to the times by dropping the custom. It must be said, however, that the most progressive men in the class are in favor of keeping the time-honored custom. Commencement exercises are to be held either in Carnegie Music Hall or at the Metropolitan Opera House, the final selection not being made up to the time of this writing. Everything will go off in good shape, just as if there had been no rumors in the class. But it shows there must have been some excitement in the senior class when at one meeting 120 members were present to vote on the matter, and there have been two or three meetings a week held to discuss the subject. There will be a valedictory address made at the senior class dinner, which is to be held some time in the week previous to commencement. The seniors this year number 165, as against about 120 last year.

In spite of the genuine sorrow over the death of Dr. Oscar G. Harrison, there was considerable amusement at the meeting of the seniors when the delegation which was appointed to attend the funeral was called upon to make a report. There was no one who considered himself able to make an elaborate report on the matter, but finally Mr. Wurthmann self-sacrificingly threw himself into the breach. The gentleman had the best intentions in the world, but he was much embarrassed, and in referring to the deceased he said: "Our fellow-instructor," which, of course, caused a snicker. That rattled the speaker so much that he went all to pieces, and only managed to say the "funeral was v-v-very enjoyable." That ended his report. The class was too much overcome to listen any more. Mr. W. has since tried many times to explain what he meant to say, but nobody will listen to him.

Lectures to be held under the auspices of the alumni association are scheduled as follows: "Nervous Exhaustion," Dr. Cyrus Edison, president of the Sanitary Board of the City of New York, Wednesday evening, February 14, at 8 o'clock. "Observations of a Pharmacognosist in London," H. H. Rusby, M. D., Wednesday evening, March 14. "First Aids to the Injured," James K. Crook, M. D., Wednesday evening, April 11.

Volume 1, No. 1, of the Alumni Journal, published by the Alumni Association, is a very neat, well arranged publication. The editor was Dr. O. G. Harrison, Ph. G., and his death, close to the date of the publication of the first number, places Fred Hohenthal and Harry Heller in charge of all editorial matters. The associate editors are Charles Rice, Ph. D., Charles F. Chandler, Ph. D., M. D., L. L. D., etc., Arthur H. Elliott, Ph. D., F. C. S., Henry H. Rusby, M. D., and Virgil Coblenz, A. M., Ph. G., Ph. D.

There have usually been four sections in the senior class, but this year only two were made, as it was thought the new college would be ready by January 1. The new college was not ready for the reception of students and the result is a sore disappointment to the young men. In previous years there were thirty students in a section; now there are eighty. The boys complain of too much crowding.

Druggist Fawcett, of Cando, N. D., must pay a fine of \$200 and serve ninety days in jail for illegal liquor selling.

INTERSTATE LEAGUE MEETING.

Thirty-eight delegates to the special meeting of the Interstate Retail Druggists' League met in Ionic Hall, Terrace Garden, at 10 o'clock on the morning of February 6. They were there to "get together," and yet they arranged themselves in two long rows on opposite sides of the hall, and sat that way until the janitor, seeing how cheerless the scene appeared, brought in seats that could be snuggled up together. Then the gentlemen warmed up, talked to each other and went to work with a will. President Canning, of Boston, was in the chair and the winning smile of Secretary Frick, of Louisville, could be seen all day long over in the corner. The other gentlemen present were: Thomas F. Main, New York; M. N. Kline, Philadelphia; Alfred H. Mason, New York; Charles Elaeu, Rochester; O. C. Winneman, Thomas E. Davis, O. Diamond, Victor Kostka, Charles A. Osmun, M. F. Bender, Oscar Kars, Thomas W. Linton, Carl Schur, A. T. Tschepe, H. A. Salmon, C. E. Kepler, A. Amend, T. O. Morrison, William Schevelles, F. W. Koch, T. J. Barnaby and G. A. Symes, all of New York; W. C. Durkee, G. W. Cobb, G. W. Flynn and N. W. Stiles, of Boston; W. P. Draper, Springfield, Mass.; M. L. H. Leavitt, Massachusetts Pharmaceutical Association; F. M. Harris, Worcester, Mass.; G. W. Johns, Rochester, N. Y.; Thomas Layton, St. Louis; I. M. Smith and E. K. Gridley, Providence, R. I.; R. C. Werner and L. F. Stevens, Brooklyn, and H. J. Alfreds, president of the Rhode Island association.

President Canning's address was first in the order of business. It was as follows:

Gentlemen of the Interstate Retail Druggists' League, and Fellow Druggists:

The large number here assembled in response to the call for this meeting evidences an active interest in the cause for which we have come together. As you must have perceived, by perusal of the published announcement, the New York City branch is principally responsible for the convention being called at this particular time and place. I am sure you were only too glad to accede to this request, believing that the great metropolis is the pivotal point in this great awakening of the retail drug profession. The sense of its immense power, hitherto latent, in alleviating the many evils besetting the commercial or business side of our calling. Our experience in New England clearly demonstrates that we have comparatively smooth sailing, after having once organized a great city. After Boston came Providence, Worcester, Lowell, Springfield, with several organizations in New Hampshire. So too, my dear friends, in a larger way, with New York thoroughly organized as the natural commercial head, will the organization of the rest of this great country be made easy; it is a forcible argument in itself.

Again you will perceive, gentlemen, that the purpose for which this meeting is called is stated in general terms, so that we may be able to discuss and transact any business that may tend to "the advancement of the League and the cause for which we are assembled."

I would not advise at this time any tampering with the laws or plan of construction of the League, leaving such action to the future after both are more thoroughly tested. It is generally bad policy to "tinker a new kettle." Time enough for soldering when it proves leaky! The plan of the League is a good one, being national, state and local in its scope. To put into effect the plan of its construction is such that we can absolutely voice the sentiments of the whole country by its delegates in convention assembled. To put into effect our energies at present in the direction of perfecting our organization, so that the measures adopted here to-day may be the quicker carried into effect.

Since the League was started some

three years ago many local organizations have been formed which can be directly traced to its paternal influence. Many of these organizations have not yet joined the parent body, however, preferring to stand on their own feet. I would like to see such associations "find it had not been for the League you had never been born." However large the aggregate amount may be, the dividend to each is but a trifle per year. What an insignificant little sum in itself, compared to the immense returns that might result from such trifling investments. I would like to see if it is a "go," but chip in your dollar and your voice with it, and help to make it "a go!"

Just at present the League wants money. Experience has taught us that it is generally uphill work to get the druggists to locally to organize among themselves—petty jealousies seem to stand in the way (why they exist I do not know). The uptown druggist does not care to meet his downtown brother, or "the north side has always held itself aloof from the south side," etc., etc., that give you a headache. I would like to send two or three bright organizers to such communities, when, lo! the "uptown" and "north side" are sitting side by side the "downtown" and "south side." At the banquet board, just beginning to realize that the interest of one is the interest of all, and wondering why they did not come together long ago! Some of the delegates will, I can tell you, try their experiences of this nature.

Your secretary and treasurer, yes, and your president, ought to be salaried officers. In such a business organization as this, I think you should include the president for two reasons—first, because I have held the office long enough to know something about the time, labor, energy and neglect that persons in trusts required to conscientiously endeavor to fulfill the office, and second, because my term expires before the League will be rich enough to make such appropriation.

Until we are thoroughly organized we need the "dollar and a half" and can get no good use of it. After that time, however, the League machinery can run smoothly at a much smaller figure.

Is there a necessity for such an organization as this? I would like to compare the average pharmacy of the past with the average as you find it to-day, and then ask yourselves the question, is there any hope for that ideal pharmacy of the future which you read about? The laboratory was the rule in the apothecary store of the past; the dispensary the exception. He of the past was not simply a preparator (not compounding) in ready-made prescriptions of great manufacturing houses; his neighboring physicians were not supplied by a messenger who was calling houses with remedial agents in such convenient form that he can prescribe and dispense at the same time in his own office; the apothecary of the past was not the victim of pernicious legislation nor was he obliged to pay more than his just share of taxation; he of to-day has all these troubles piled against him, and even more, for I have not only said anything about the proprietary medicine question. Verily, gentlemen, unless we put our heads together, we can not acquire a telescope to find the business end of the drug store. With an organization such as the League contemplates many of our difficulties may be at least abridged if not entirely surmounted, and further "broads may be prevented."

Now, gentlemen, allow me to trespass upon your valuable time by expressing a few thoughts on the subject of patent medicine question, and how to regulate the sale of these goods. The patent medicine has peculiarly a growth of the latter half of the present century, and is eventually to be regulated, beyond question, by law. In the meantime no one is better adapted to act as distributor to the trusting consumer than the pharmacist, who can best discriminate as to those safe to sell, and those which never ought to "see the light of day." We will not now attempt to discuss the details of the businesslike competition in the sale of these articles, but will endeavor to supply the remedy.

A plan to regulate the sale of proprietary medicines to approach perfection must embrace the following elements:—First, must, to bring about the maximum amount of success, contain the minimum amount of dependence on "good faith" alone; it must be a sensible business

measure, appealing to the business interests of proprietor, jobber and retailer alike; it must bring about the "greatest good to the greatest number"; it must consider as little business as possible, to either of the quartette interests involved; last and most important, it must have the active co-operation of all concerned.

The following simple plan already adopted by the League at its last annual convention, and having the indorsement of every local organization thus far to which it is possible to get, will contain all the necessary ingredients. It differs from the compromise measure adopted at the recent meeting of the N. W. D. A. in coming to the fore in the Detroit plan. Therefore, if it meets with your approval, I would suggest that it be called the League plan. Here is the first recommendation in form: Resolved, That the Interstate Retail Druggists' League respectfully recommends,

That proprietors accept orders for full quantities, with rebate discount, only from regular jobbing druggists, recognized as such by the League, who shall faithfully observe the prices and conditions established by the manufacturers, said manufacturers or proprietors to sell in full quantities, and to employ no druggists as agents to entirely control the sale to retailers, at uniform prices, regardless of quantity.

That each manufacturer is hereby requested to adopt a system of marking, by which his goods may be traced.

Resolved, Second, that, in other respects than the foregoing, we recommend that the adoption of the details for carrying out this plan be the same as those adopted at the Detroit meeting of the N. W. D. A., emphasizing our interest in the special clauses in the form of letter from manufacturer to wholesale agents relating to recognized and voluntary cutters, and to "League or Association embracing 50 per cent, etc.," rigidly enforced.

It is thought that this plan is nearer perfection than any so far suggested, and even if after a trial it is found wanting, it will strengthen the League, being easy to carry out. The manufacturer would be enabled to greatly reduce his counting-room expenses, and I claim that it would sell more and more goods than at present on account of the additional will from the retailers. Less inducement to substitute, though I do not in this connection desire to cry down certain forms of so-called substitution.

Under this plan, the only party given any extra work to do is the jobber, but he will be glad to take all these retail cutters off his hands, and he will be for his best interests as a business man to help his customers in getting living and bill-paying prices. You will not wonder, therefore, that this is based upon organization of the retailers, thus a slippery jobber would think twice before daring to run such a gauntlet.

Now as to the retailers; there are two classes that now buy direct from the manufacturers; first, a very small class, able to do so for their own legitimate sales, and second, a larger class buying direct from the manufacturer to divide up with neighbors. In either class the incentive for going direct is the same, viz.: to make the profit on buying, close competition preventing one from doing so at the selling end. Both classes, if these buyers were to band to make a fair profit on selling rather than a meager one on buying. Supposing the cutter for a time succeeds in getting the goods under this plan, he no longer has a ten per cent advantage of you! Supposing after this plan is put into effect some manufacturer cannot resist the temptation to make a trade in hands, you stand the League platform! But I will not offer any more arguments in favor of this plan—I want to leave something for you to say in your own floor.

I have but two other recommendations to offer. One to this effect, viz.: "That the fees of local branches shall be due upon the League's account, and thereafter annually from that date." My reason for this is obvious; this is a business organization and we want all local organizations to come in and join upon forming. There is no rule laid down to be regarded in this question, though I believe that dues have been supposed to be payable at some fixed date. My idea is this—If dues are payable in January, for instance, we do not want a local organization formed in September hesitating to come in because the year begins in Janu-

ary. They may change their minds in three months. Let them come in immediately.

I respectfully ask you to appropriate a sufficient amount to cover the secretary's hotel and traveling bill attendant upon this meeting.

In closing, let me extend the privilege of the floor to all present, expressing the hope that any action we may take may be of the unanimous sense of the general meeting. In the event of a division, all questions will be decided by the votes of the representatives of local branches and the officers of the League, including the executive state officers.

I trust your deliberations at this meeting may be earnest, honest and productive of good results to you and your fellow pharmacists. At the same time let me express the hope that your discussions may be tempered with wisdom well tempered with fraternal good fellowship. After you have left here and gone to your homes, put your resolves into immediate effect.

Messrs. Kostka and Layton were appointed a committee to act upon the president's address and retired to consider their report. The president had referred, before beginning his address, to the small number of delegates present, saying that he did not feel discouraged, however, because these movements always seemed to be started by a few men. But even while delivering his address the number of delegates had increased perceptibly. Mr. Canning told the delegates that more representatives were needed from New York. He saw several representatives of jobbing houses present and welcomed them because, he said, "Their interests and ours are identical." So he called upon Thomas F. Main, chairman of the N. W. D. A. committee, to address the League. Mr. Main told the delegates that the N. W. D. A. had always done what it could to further the interests of the retailers. He expressed pleasure at being able to be present at the meeting and his willingness to assist the gentlemen in any way he could.

Mahlon N. Kline, also of the N. W. D. A. committee, followed Mr. Main. He praised Mr. Canning and his work, and said that the League was able to do great work in getting the retailers together. A large majority of the proprietors whose goods are sold under the rebate plan, he said, are willing to adopt the plan when assured of its practicability. "At the meeting of the N. W. D. A. at Detroit," said he, "there was a unanimity of sentiment that was very encouraging in favor of a simple, practical solution of this matter. The plan appeared to meet with approval and to my mind deserved it. But it is hanging in the air. As far as the retailers are concerned it will hang there until they pull it down. The plan as agreed upon does not appear to have met with such a reception on the part of the retailers as must come if it is to be made a success. There is a missing link in the chain and it must be supplied by this or some other organization before the plan can be made a success. I hope in spite of the discouraging numbers here to-day that the enthusiasm will spread, so that you will have in fact as well as in name an Interstate Druggists' Association."

N. W. Stiles, of Boston, said that the druggists of that city were endeavoring to work energetically. They had secured between 300 and 400 signatures to the Detroit plan, but were ready to push any plan that seemed the best.

President Canning remarked that the traveling men of the drug trade could do much good if their services could be secured.

cured, and in order to let the members of the League hear what one traveling man had to say he called upon Irving M. Smith, of Providence. Mr. Smith was the organizer of the Mortar and Pestle Club, to which belong most of the druggists in the little state. The value of organization and co-operation, the situation of the wholesale druggist prior to the rebate system and his position now, were the points dwelt on by Mr. Smith, who thought the present plan was entirely feasible. Providence cutters had told him that they would be glad if they were forced into such a plan. "The interests of the people are just as well satisfied if they pay full value for patent medicines," said Mr. Smith.

Just here G. W. Johns, of Rochester, arose and made a little address that was brim full of quaint sayings and horse sense. He'd come down to New York to see what the League was going to do, "and if it did what was right, well, then, the Monroe county association was going to come in." Ninety per cent of the Monroe county druggists were organized, they had little gatherings and good times. "The average druggist is a cold, unso-called chap," thought friend Johns, "and he ought to be ashamed of himself. All other professional men get together. Why don't the druggists? Get up and mingle with the world," was his advice.

That speech did a lot toward warming up the meeting.

W. F. Draper, of Springfield, said that the druggists in his city were going to stand on one platform, that of harmony. Goods that the masses of the people were using every day must sell at a low margin of profit. On such articles as are not in common demand a larger profit could rightly be obtained. He wanted to carry back home some strong helpful word from New York. In Springfield the organized druggists had held a conference with the proprietors of the leading department store and secured the promise that the store should be worked in unison with those of the druggists. Those proprietors would also probably agree to the whole price list. The worst cutter in town had thrown up the sponge when he felt sure he could not get goods at lower prices than other druggists. The retailers had told this cutter that no matter how low he sold his goods they would meet his prices. As he couldn't make anything by staying out he came into the fold, and is now chairman of the pricing committee of the Springfield association.

Thomas Layton, of St. Louis, told quite a different tale than Mr. Draper. "We used to have an organization of retailers," he said. "There are just three members left." Experience had shown that the local association alone was not sufficient to keep the cutter from doing a thriving business. "St. Louis retailers," said Mr. Layton, "have lost confidence in the proprietors as a class. Since March 6, 1893, it has been 'go as you please' in our city. I hope to go home with such word that our people will regain their confidence. We want to see that the proprietors are really interested in this Detroit plan."

F. M. Harris, of Worcester, told a story that was much like Mr. Draper's. Twenty years of cutting had been brought to a close by the organization of the local druggists. He thought the "League plan,"

as suggested by President Canning, was better than the Detroit plan.

By this time the delegates were hungry, so a recess of an hour was taken. After lunch Secretary Frick presented his report and the treasurer's statement was read by President Canning. The League had on hand \$222 30, and some more money was to be paid in that day by associations wishing to join.

W. C. Durkee reported for the committee on credentials. Including Messrs. Main and Kline, of the N. W. D. A., there were thirty-eight delegates present and six other gentlemen, representing associations which had not yet paid their fees, had come in since the session began.

The committee on the president's address reported that all the recommendations in the address should be adopted.

Considerable discussion followed, and Mr. Layton submitted a resolution adopted by the wholesale druggists of his city, which asked the Interstate League to adopt the Detroit plan. The resolution was signed by six St. Louis firms.

Mr. Tscheppe spoke of the organization of German druggists, some 130 in all, and how successful it had been. He was also impressed with the fact that in this city the conditions seems unfavorable to concerted action on the part of the druggists.

Then came a discussion in regard to the suggestions of the New York branch, which recommended legislative work. President Canning opposed the New York suggestions as detrimental to the best interests of the Interstate League and of such a character that the delegates could not well vote upon them without consulting their respective associations.

Mr. Main also opposed the views of the New York branch. Legislative interference of any kind in commercial matters was dangerous. He had learned that in his many years' experience as a member of the N. W. D. A. committee on legislation. Very impractical was the suggestion that a lobbyist should be employed. The lobbyist would make money year after year and insure his continued employment.

Mr. Mason, of Seabury & Johnson, called President Canning's attention to the fact that his suggestions altered the Detroit plan materially, changing "wholesale houses" to "wholesale druggists." Mr. Canning had proposed this change at Detroit and being unable to effect it had professed his satisfaction with the Detroit plan. The president answered: "I felt at that time that half a loaf is better than no bread, but now I find that the original Detroit plan does not give even half a loaf. I found that on further investigation." Mr. Canning thought if the League was strong enough it could get the whole loaf.

Mr. Kostka favored the New York resolutions, for though there might be weak points in them he was sure there were some strong ones too. Something more than the League platform alone was needed to arouse the New York state pharmacists.

The New York resolutions were tabled, and the report on the president's address was unanimously adopted. This report also added the president's name to the secretary's in regard to the refunding of expenses incurred in attending the special meeting. The meeting then adjourned. In the evening several of the out-of-town delegates were entertained by members of the New York branch.

BOSTON.

Boston, February 10.—There was a lively hearing at the State House the other day, with an immense attendance of druggists and prominent temperance workers from all over the state. It was all on account of the following order introduced in the house on January 15 by Representative Estabrook, of Newton.

"No license of the sixth class described in Section 10 of Chapter 100 of the Public Statutes shall hereafter be granted to any person who is not a registered pharmacist, actively engaged in business on his own account; nor to any such registered pharmacist unless he shall present a certificate from the State Board of Registration in Pharmacy stating that, in the judgment of said board, he is a proper person to be intrusted with such a license, and that the public good will be enhanced by the granting of said license."

The first speaker in favor of the order was ex-Senator Emerson, of Haverhill, a druggist of forty-four years' standing. He made a strong argument in favor of the passage of the bill. He said that the drug business has been steadily retrograding, and that the clerk of to-day is deficient in education and a cheap article. In years gone by it was an honor to be a druggist, but there is little honor or profit in it now.

Edward S. Kelley, of Kelley & Durkee, Boston, supported the order, saying that it is one which would weed out those who are poor druggists, but good liquor sellers and nuisances in the community.

S. A. D. Sheppard said the meanest class of men in any community in the state is druggists who sell rum indiscriminately. The bill is one which should have the hearty support of the liquor dealers, as the druggist who sells liquor is interfering with the business which the former paid a high fee for.

Mr. Bancroft, of Cambridge, argued that something should be done to relieve the druggists of the necessity of filling physicians' prescriptions. He knew of a man's receiving sufficient prescriptions from a doctor to make him a drunkard.

Representative Estabrook, of Newton, said that the idea of the bill is to weed out such pharmacists as are masquerading in that disguise, while in reality being rum-sellers. He had known druggists to make drunkards of otherwise sober men.

A. L. Aldrich, of Bourne, supported the proposed law vigorously, principally on the ground that youths who are too respectable to enter low groceries will patronize the drug store where liquor is sold.

Rev. Alfred Noon, secretary of the Massachusetts Total Abstinence Society, argued very strongly in favor of the order. He said he had occasion to visit all parts of the state, and it had long become evident to him that there was a feeling of distrust everywhere among temperance people with regard to drug stores, and that he thought the bill under consideration would serve to alleviate the evil and restore confidence to a great extent.

Henry H. Faxon said he wanted to "straddle the bill," as it were. There is law enough on the statutes now with relation to druggists if it were but carried into effect. The druggists of the state can teach the devil the art of deception, and it matters not how bad a man a pharmacist is, he seems somehow or other to have friends to help him when in difficulty. If this bill were passed, spurious

doctors would arise all over the state who would issue orders or prescriptions, and the evil would be as bad as ever. The Legislature is not smart enough to pass laws which can circumvent a rascally druggist. A plain law should be passed. If anything, making the penalty six months' imprisonment without option of a fine for any druggist convicted of selling liquor illegally. He never knew a druggist yet who was so honest that he would not bear watching. His experience with law in such matters was that if you put ten words into a bill you would be obliged to go to the Supreme Court to explain the meaning of each word separately. Druggists and rum-sellers could get lawyers to defend them who were worse than they were themselves. The devil cannot be suppressed by a large fee; neither can rum-selling be stopped by this bill. The Legislature needs to make a much stronger law to convict a druggist than it does to convict a rum-seller. His experience with Jamaica singer drinkers has been that they are invariably liars.

Mr. Temple, of Sharon, said that in New Bedford, Nantucket and Canton more young men had been ruined by the drug stores than by rum-shops. He thought an amendment should be added to the order, which should make a pharmacist lose his certificate if he violated the liquor law, which should prevent him from engaging in business again.

Ex-Representative Rockwell, of Fitchburg, was heard against the bill.

Many a druggist has had good reason within the last fortnight to mutter bad things about the mayor of Everett, who, in his zeal to make a record, has been engaged in warfare on the nickel-in-the-slot machines, which sometimes give you a cigar and sometimes do not. This innocent amusement appeared to the aforesaid mayor to be so pernicious that he buckled on his armor and strode forth to put an end to it. Having convicted a man of "maintaining a lottery," he has caused so much alarm that there has been a general removal of the machines not only in Everett, but here, lest other arrests may follow.

The druggists of Malden have organized the Malden Druggists' Association, with a membership of twenty-three, including nearly every druggist in the city. The object of the association is the mutual protection and general welfare of the profession, and to foster a feeling of sociability and good feeling among its members. The officers are: President, W. B. Southworth; vice-president, J. Ingalls Street; secretary, C. A. Charles; treasurer, A. B. Morgan; standing committee, President Southworth, W. P. Sheldon, H. A. Miner, L. W. Rockwell, Jr.; J. J. McCarthy.

The Board of Registration in Pharmacy held sessions on January 23, 24 and 25, examined thirty-eight applicants and granted certificates to William M. Gowen, of Amesbury; Fred O. Churchill, of Boston; George E. Palmer, of Lynn, and John H. Moores, of Danvers.

Frank A. Barnes, a druggist at Florence, has failed, with liabilities of about \$4,000. He states that the dull times among the manufactories is the cause of failure.

A meeting of the creditors of Harry G. Travis, druggist, 25 Hanover street, has been set for May 11.

Druggists have been heavy sufferers by

fire of late. At Palmer, O. P. Allen, druggist, lost \$6,000. He was insured for \$4,000. The cause of this fire is unknown, but it is probable the electric wires were responsible. On the morning of January 31 fire was discovered in the basement of the McCarty block in Hollbrook. The flames were confined to Helyea's drug store, but smoke, water and the ax caused considerable damage and loss to other portions of the building. The stock in the drug store is a complete loss. Its value is estimated at about \$2,800, covered by insurance. In East Freetown, Heath Bros.' chemical extract works were destroyed by fire, causing a loss of \$10,000. There was an insurance of \$5,000. The fire is supposed to have caught from a defective chimney.

A wise measure has been introduced before the Massachusetts Legislature. It imposes a penalty of \$500 on anyone who shall paint on any house, barn, shed, mill or other building patent medicine or other advertisements, the letters, numbers, figures or characters of which are in length more than six inches or in breadth more than four inches. The act is not to apply in cases where the sign or advertisement is upon a building which is being otherwise used in the business which is being thus advertised. This move against disfigurement on otherwise pleasing rural scene is a commendable one. Good newspapers and magazines are good enough mediums for any kind of advertising.

Rosindale society is much stirred over the reported elopement of Arthur A. Chesley, a former drug store proprietor, and the young and pretty wife of L. Munz, the proprietor of the Rosindale Hotel. They have been missing for more than a week. Chesley came to Rosindale from Chicopee about fifteen months ago, and became the proprietor of a drug store on South street, close to the Rosindale station. He was about 22 years old, good looking and especially popular among the younger female set. He soon established himself in much favor in the village, joined the church and was a prominent participant in nearly all the social events of the place. He engaged board at the Rosindale Hotel, and for a time all went well. Mrs. Munz often called at the store, and over many a foaming glass of soda engaged in conversation with young Chesley. There was nothing significant in the visits other than their frequency, which was soon noted by gossips. Whether their stories were carried to Mr. Munz is not known, but in the course of four or five months he notified Chesley to get a new boarding place. About a fortnight ago Chesley sold out his business in the town and went away. To a few friends he confided that he was to engage in other business, and had opened an office at 297 Tremont street. His departure was much regretted by his many friends. When Mr. Munz found that his wife had disappeared he went to the Tremont street office and found that Chesley had wound up his business there. He ascertained that the druggist had driven up to the office in a hack Saturday morning and that two trunks were strapped on behind. One was his and the other was a brand new one. He placed all his personal effects in the old trunk, the hack dashed away and that was all seen of Chesley in that vicinity. All this happened the day that Mrs. Munz disappeared, so that her husband does not doubt that she went away with the young

druggist. It was learned a few days after the elopement that the runaway couple went to Nova Scotia.

Frank C. McKenna, for many years a traveling salesman for James W. Tufts, died at his room at 25 Howard street on Sunday, January 28, at 6 o'clock in the morning from a stroke of apoplexy. Mr. McKenna was known to every druggist and soda water dealer in eastern Massachusetts, to many of whom he had endeared himself by his unflinching good nature, his love of innocent fun and his unswerving integrity; while all knew him as an energetic and straightforward business man. Mr. McKenna was 35 years of age. He entered the employ of Mr. Tufts as a junior clerk in 1883, advancing rapidly from one position to another until he became one of the leading salesmen in the business. He had hosts of friends in and out of the trade, and was greatly beloved by his fellow-employees, salesmen, clerks and mechanics alike. His death was quite unexpected, as he was apparently in his usual health. He was stricken on Saturday morning. The obsequies of Mr. McKenna were held in the presence of a large throng in St. Joseph's Church, Chambers street. A requiem high mass was celebrated.

Robert Nickerson, a clerk at A. M. Burnham's drug store in Roxbury, has gone on a trip through Canada.

Cornelius Murphy, formerly with Edwin T. Leach, of Taunton, has recently taken charge of the store 64 Dover street, owned by Gilbert & Jonah.

E. I. Sawyer has opened a new drug store in the Saco block. The fixtures are of quartered white oak, made by Whittle, and the fountain is a Low art tile, manufactured by the Low Art Tile Co.

Jacob S. Potter has bought the drug store of Arthur A. Chesley, Rosindale. Mr. Potter has had eight years' experience in business in large stores. He has also been a clerk at the Rosindale stores.

According to the records of the State House the Cochrane Chemical Co.'s financial standing at the present time is as follows: Assets, real estate, \$162,775; cash, \$77,971; stock, \$158,097; miscellaneous, \$4,176; liabilities, capital, \$350,000; debts, \$33,019.

The new building which is soon to be erected for the scientific department of Yale College will be three stories high and in dimensions 60x125 feet. It will be one of the finest chemical laboratories in the country. The building will be of brick. The upper floors will be given up to a large laboratory and recitation room; the second floor by a qualitative laboratory and the first floor will be used for quantitative laboratory. The funds for the building are to be supplied from the university treasury. The cost will be about \$125,000. Work will be begun in the spring.

Andrew G. Weeks, of the Weeks & Potter Co., has been engaged in some interesting real estate transactions. Three pieces of property on Oliver street were recently transferred to him. What he paid does not appear, but the assessors value them at \$17,500. Since this purchase Mr. Weeks has bought the five-story stone mercantile building, numbered 89 and 91 Summer street. The building stands on a lot of land having an area of 2,650 square feet, which is assessed at the rate of \$26 per square foot, or a total of \$68,900 for the whole area. The building is taxed for \$21,100.

Gardner F. Daniells, broker, 46 School street, has lately had a hand in a number of interesting transactions, among which he reports the following: Percy E. Manning has sold out to Edward Jaquith the drug store at 127 Tremont street, Roxbury, and Jaquith has in turn sold to Samuel Siskind, who has been head clerk for B. F. Bradbury & Co. for a number of years; F. H. Martin has sold the drug store at 83 Leverett street to N. Sterdiant & Co.; Patrick F. Curley has sold the drug store at 117 Hampden street, Roxbury, to Gustave Desy, of Claremont, N. H.; Charles A. George's drug store at 64 Dover street has been sold to Gilbert & Jonah; George Colton's store at 155 Cambridge street has been sold to E. G. Cutler; Sturdivant Bros.' store on Leverett street, known as the West End Pharmacy, has been sold to Joseph Prodi.

There is published in Boston, annually, a useful little volume known as the "Blue Book," containing the names of all persons living in fashionable localities. Copies are kept in the best stores for customers' use, just like the regular city directory. Now a well known druggist, having had his copies stolen several times, finally decided to reserve the latest edition of the Blue Book for his own use, and let the public enjoy the edition of '91. One day the latter book disappeared. The next week the clerk of another drug store called and asked: "Is not this your Blue Book?" In reply to the question, "How did you get it?" he told this story: "A man came into the shop and asked if he could look at the Blue Book. We loaned him the latest edition. Having occasion to look at it an hour afterward, we found this one of '91 in its place; and here is the name of your firm on the inside cover!" It takes nerve to collect new books in this way.

Down in Belfast, Me., people have had the liveliest sort of a time over a discovery made in R. H. Moody's drug store. Mr. Moody's father died about ten years ago. Three weeks ago the druggist took down from a shelf a box containing some chemicals he wished to use. On the bottom of the box, where it had rested upon the shelf, there appeared to be a picture of old Dr. Moody, the druggist's father, dead and in his grave these ten years. The portrait had been ground into the bottom of the box by the action of the dirt on the shelf. Moody keeps the box on exhibition now, and turns it up for inspection to chance visitors, at the same time exhibiting a photograph of his father. Nobody has questioned the similarity yet, and the box has been exhibited to hundreds already. It is quite the fad to drive in from the back towns and look at "that box of Moody's with old Dr. Moody's face on it." Spiritualists allege that Moody, Sr., materialized, and has been at work under the box on his son's shelves. They have photographed the box. Apothecary Moody has not been converted by the spiritualists yet. He thinks it was "just luck, anyhow."

Just how seriously some folks view this discovery is evidenced by the following statement from the president of the Theosophical Society in this city. He says: "The resemblance between the photograph and the image on the box is probably significant. I do not believe that the agency of a disembodied spirit had anything to do with it. From my point of view as a theosophist, it would be looked upon about like this: Just as a picture is

photographed upon a negative plate in a camera, so upon a medium surrounding us everywhere—call it the ether—are photographed images of our persons and of our thoughts. Dr. Moody's face had been thus photographed for years upon the ether in that shop—thousands of such images exist there. One of them has become condensed upon the box. It makes no difference that the man has been dead ten years, because the images are eternal, and as to why the image did not appear on the box before, I should say that the box had only just got into the required condition of sensitiveness. If a chemist knew enough he could analyze that condition and see just when a reproduction is possible. I do not believe in the active agency of spirits, but I think that after a spirit has left the body there remains an image of the body—as it were, the cast-off clothes. That picture on the box is one of Dr. Moody's cast-off clothes."

Prof. William James, of Harvard University, was shown both the mysterious portrait and the photograph of Dr. Moody. He was greatly interested in the alleged portrait and examined it carefully. "It is certainly very curious," said Prof. James, "and I am glad to see it. But I must say that if it is a portrait at all, it does not seem to me to be a portrait of the person represented by the photograph. It seems to me, on close scrutiny with the glass, to be simply an odd and fortunate arrangement of dirt and stains. It does not appear to me that this arrangement of dirt and stains is purposely made, but it seems to have been wholly accidental. There is no reason why stains and dirt should not take this form just as well as any other. But this thing is certainly very odd and curious."

An old house standing on the corner of Main and Lexington streets, Waltham, is being remodeled, and one of the men who was working near an old chimney pulled out of a hole in the partition a rusty-looking leather box, which, on examination, was found to contain a diamond stud weighing eight carats, a pearl necklace, a bag of coins, a number of rings, two watches of antique make and a number of what, after some difficulty, were found to be deeds of some kind. There was but little there to fix the identity of the treasure; the papers were so old that only their general drift could be made out, and the coins were corroded to such an extent that their dates could not be discovered. An expert said that he thought they were Spanish doubloons, and if so, the coins alone would be worth in the neighborhood of \$250. With regard to the history of the treasure nothing can be learned. The house has always stood where it does now as long as the oldest inhabitant can remember; nothing is definitely known of its history farther back than fifty years. During that time it has been used for dwelling purposes, for a jewelry store, a postoffice and an apothecary store. It is believed that the money was hidden by the apothecary. Little was known of him except that he was very old and lived there all alone. It is possible that he may have died suddenly, without having time to tell anyone of his concealed wealth. The fact that some apothecary's vials were found in the partition would seem to point to the same explanation. Perhaps this druggist, like the late W. E. Woodward, of Roxbury, a famous collector, had a fancy for old coins and other curiosities.

PHILADELPHIA.

Philadelphia, February 10.—There is considerable opposition in this city to the increase of the dues of the N. W. D. A. from \$10 to \$25. A number of the members, especially those who do not deal in or handle patent medicines, have come to the conclusion that \$25 a year is too much, especially as they are not being benefited. The associate members, who have the same privilege as active members, except that they cannot vote, have \$15 refunded to them. One of the manufacturing chemists of this city recently sent in his resignation, at the time protesting against the increase. A few days ago he received a reply from the treasurer in which it was stated that there was a movement on foot to refund to all members who are not connected with the patent medicine business \$15, the extra dues, and until some decision was reached the resignation would be held over. Besides this manufacturer there are several others who have either resigned or intend to.

The removal of the Reading Railroad Company's depot from Ninth and Green streets to Twelfth and Market streets has caused the business men in the former section considerable loss in trade. This is especially applicable to the drug stores in the neighborhood, all of whom did a large transient business.

Frederick G. Orth, the popular druggist of Holmesburg, has his store illuminated by electricity. Mr. Orth is a jolly good fellow, and dearly loves to hear a good story as well as to tell one. It is said he has the electric light over his desk, hung in such close proximity to his head, for the reason that he believes electricity is good for heads that have parted with their hair.

A. F. Merrill & Co., southeast corner of Nineteenth and Fairmount avenue, have one of the finest stores in the city. It is well lighted and the stock is artistically displayed. Mr. Merrill is a believer in printers' ink, and he says large benefits are derived from advertising. The ever-flowing soda water fountain occupies considerable space near Nineteenth street. The whole building, which is four stories high, is owned by this firm. Merrill & Co. have just come into prominence by issuing a manifesto against the A. P. A. plan. The circular reviews the features of the plan, and after stating that the firm was placed on the "cut-off list," solicits trade for patent medicines and other goods at cut prices.

M. N. Kline, in speaking of the Detroit plan, said: "I was very much gratified to learn while in Boston that a very large percentage of retailers in that city and Massachusetts and Rhode Island generally, have organized branches of the league and are signing petitions in favor of the Detroit plan. This, it is hoped, will spread, and arrangements will be made to get petitions in favor of this plan signed by the druggists in all the principal cities in the United States. The New England druggists seem to appreciate fully that so long as proprietors will fill orders direct from retailers, especially those who cut prices, the rebate plan is an injustice to them, and they are certainly going the right way about it to have this corrected. On the other hand, I was impressed with the fact that they appear to be convinced that the days of full list prices have gone, never to re-

turn. This portion of their business they must expect to conduct on a smaller margin than in times past, but all wide-awake druggists are satisfied that they can maintain their position if they are not placed at a disadvantage in purchasing their supplies.

The thirty-third annual meeting of the Philadelphia Drug Exchange was held on January 23. After the annual report had been read and while the voting for officers and directors was in process an elaborate lunch was served which, with punch, made as only Harry McIlvaine can make it, soon put everybody in a good humor. The feature of the meeting was an impromptu discussion between Mr. Crenshaw, of Bullock & Crenshaw, and Dr. Mattison, of Ambler fame. Both are extremists, the former being a very large man and a southern Democrat, and the latter a medium-sized man and a Republican in every sense of the word.

The report, after stating that the membership was about the same as last year, proceeded:

The recent defeat in congress of what is known as the Torrey bankrupt bill, though disappointing to the hopes of its advocates, and depressing to the many thousands of unfortunates who are looking to it for relief, should not, and must not, be accepted as a final disposition of the matter. Its friends are too numerous, and the innate vitality of the movement too energetic to admit of so sorry an ending. For several years in succession the earnest efforts of business men from all sections of the country have been put forth in support of a national, and consequently, a uniform system of treatment applicable to the settlement of bankrupt estates.

A national bankrupt law is a necessity in any mercantile or manufacturing community, and if judiciously framed, will prevent, absolutely, by prompt action, the shrinkage of values and increase of costs incidental to delay, and at the same time render to the requisite legal talent engaged just recompense for services rendered. The settlement of an estate would be made as speedily as the interests at stake would permit, and creditor and debtor alike be relieved, the one by receiving all that was possible to be realized from the estate, the other by freedom to again fight his way to usefulness.

To this end must the agitation of the subject be continued. More than ever before, perhaps, the necessity for such legislation exists at the present time. The hundreds of associations and exchanges who have united in the petition to congress to pass a bankrupt law, represent many thousands of active, earnest business men, who have a right to expect favorable action upon a request which, in the interest of their fellow traders, is demanded in the name of justice and mercy. The request is so far free from political or partisan entanglements that every legislator can act conscientiously thereon, and the men who ask it are themselves largely of the creditor class, and most ready to aid those who unfortunately are in their debt.

The business men of the country are in earnest in the matter, and unwilling to let the movement go by default. We ask you once again to affirm your continued adhesion to the cause of a national bankrupt law.

The report then directed attention to the high rate of duty on imported spirits and

alcohol, and states that at present the custom duty is \$2.50 per proof gallon, equal to \$1.70 per wine gallon or 91 per cent. The internal revenue tax on distilled spirits is 90 cents per gallon. Thus the custom duty is \$2.50 per proof gallon against 90 cents internal revenue tax in the United States, making a difference on proof spirits of \$1.60 per gallon, and the suggestion is made that, with an internal revenue tax of 90 cents per proof gallon, the customs duty should be about \$1, instead of \$2.50, and with an internal revenue tax of \$1.60 on a wine gallon of 91 per cent alcohol the customs duty should be about \$2 per wine gallon, not proof gallon, as at present.

On "tariff legislation" the report said: The frequency of changes in the tariff may be said to be deplorable. Why? Because legislation of duties, to be found on correct principles should be stable, and, so to speak, immutable. Nothing more deranges finances, nothing more shakes confidence than alterations being permissible in this respect. A changeable legislation disconcerts the best planned enterprises, and baffles all business ventures. The greatest care should be taken and the utmost limit of intimation as to changes should be recorded. Inequality assured is a lesser evil than continued uncertainty, and the sooner we arrive at some definite conclusion and adopt a policy based upon principles applicable to all the better it will be for the country at large. In regard to the internal revenue tax itself it would be unwise to waste time by entering into any discussion. We have had taxes for many years, and under various administrations. We have had the whisky tax at 20 cents, and we have had it at \$2, and at various intermediate rates. Upon this tax the unanimity of sentiment favorable to its perpetuation is most remarkable, considering the incompatible character of the component parts. It would be useless to urge a reduction of the tax, and utterly folly to try to influence its removal in the matter of free alcohol for the arts and manufacturers.

When it is considered that the amount of distilled spirits consumed in the arts is very large (said to have been 10,976,542 proof gallons during the twelve months ending December 15, 1883), nothing would seem to be more natural and nothing, apparently, more reasonable and proper, than to urge free alcohol for such purposes, and so we find that almost constant reference is made to the propriety of granting exemption to manufacturers. Free spirits, whether clean, whether methylated or otherwise denaturalized, will never be permitted in this country, so long as any internal revenue tax remains on the article, no matter for what it may be intended, unless coupled by restrictions and regulations, fines and penalties, of most objectionable character, yet unavoidable. In this country bills have been formulated to give both clean and methylated spirits to manufacturers, but to manufacturers only, not to druggists; but manufacturers, as a rule have preferred the tax, rather than submit to having bonded warehouses, watchmen, storekeepers, fines, penalties, delays, hardships, expense and government espionage.

The report concludes: We regretfully announce the death of Mr. Cooper Smith, who died December 8, 1893, 56 years old, who was a continuous member of this association for twenty-five years and at

one time a member of the board of directors. On the minutes is the following tribute to his memory. By the closing of the earthly life of Cooper Smith we, in common with all who knew him, are called upon to lament the loss not only of a man of affairs whose integrity commanded universal respect, but of a gentleman whose graceful courtesy and uniform consideration endeared him to all with whom he came in contact.

The election of officers for the ensuing year resulted as follows: President, William J. Miller; vice-president, Charles E. Hires; treasurer, Edward H. Hance; secretary, William Gulager; directors, L. H. Lapp, A. H. Jones, H. B. Roengarten, M. N. Kline, Dr. A. W. Miller, Dr. H. V. Mattison, H. N. Rittenhouse, John Ferguson.

Charles D. Burk, who represents W. B. Burk & Co. in the city and near-by, has recently been given the agency of Alfred Wright's perfumes.

Monroe P. Lind, of Schandelin & Lind, is on his annual spring visit to the south. Advice recently received state that he is finding business better than he expected.

On January 31 the wholesale liquor house of Lath & Co., at Second and Vine streets, was damaged by fire to the extent of \$7,000, the origin of the fire being a mystery.

D. G. E. Musselman, who has for many years kept the drug store at the northeast corner of Twentieth and Parrish streets, contemplates making a number of improvements in the spring.

Erwin C. Shafer, who has until recently been manager of the drug store at Eighth and Green streets, has resigned to go into business for himself. He has purchased the drug store at Branchtown from Mr. Ackers.

On January 25 the American Soda Fountain Co., with headquarters in Boston, declared a quarterly dividend of 11-2 per cent on the first preferred, 2 per cent on the second preferred, and 21-2 per cent on the common stock.

The city of Chester, which is about fourteen miles south of Philadelphia, is a thriving place, and the drug stores in it are up with the times. Recently the store on the corner of Concord avenue and Seventh street was purchased by John H. Klrk from Mr. Brynes.

While Mr. A. J. Richards was examining some old files in the office of the Richards Drug Co., Marietta, O., he came across an interesting invoice from Lehman & Smith, which shows the prevailing prices of drugs in 1813. The invoice was sent to the Smith, Kline & French Co., this city, as it was presumed this house was the original Smith house, but which is not the case.

The recent examination of the Pennsylvania State Pharmaceutical Examining Board, held in this city and mentioned in the last issue of the Era, has been productive of more sorrow than joy. The result shows that only twenty-six out of 167 who applied in the registration class passed satisfactory examinations.

Druggist Niskey, one of the enterprising druggists of the twenty-ninth ward, who has from time to time been located at Ridge and Girard avenues, has gone back to his old love to stay. He is going to enlarge his store, and when it is completed he thinks it will be one of the finest in the northwestern section of the city.

Advance copies of two important pharmaceutical works have just been issued—the United States Dispensary and the National Dispensary. Both of these commentaries on the United States Pharmacopoeia follow that book in very close time, considering the vast amount of work necessary in making the revisions.

A Ridge avenue druggist has for several weeks past had an opaque jar standing in a shop window. It was stated that it contained a number of pills. Purchasers of goods were given an opportunity to guess "how many." The successful one was to receive \$20 in gold. Someone guessed seventeen and a quarter and was told he was correct. There was room in the jar for 10,000 or more pills.

A new row of houses has been recently constructed on the ground formerly occupied by the House of Refuge. The builder, Mr. Sharp, noticed that there was a dearth of drug stores in that section of the city, and he had the corner of Twenty-third and Parrish streets made into a store suitable for a druggist. He has had several offers for the building, all of which he has declined, as he wants a drug store on this corner.

Protests continue to pour in on the board of health in reference to placing tuberculosis on the list of contagious diseases. The latest came from a delegation from the college of physicians. They stated that the attempt to register consumptives, and to treat them as the subjects of contagious diseases, would be adding hardship to the lives of these unfortunates, stamping them as outcasts of society. Strict attention on the part of the physicians in charge of individual cases, insisting on proper disinfection and ventilation would meet all the requirements of the situation, as far as they could be met.

The Board of Trustees of the Philadelphia College of Pharmacy is negotiating for the purchase of an electrical plant, and the alumni association has pledged itself to raise \$3,000 to cover the expense. Some subscriptions have already been made, and more are in order.

It is proposed, when the dynamo has been placed in position, to run the elevator by electricity, and the subtle force will come in handy in a variety of ways in college work.

The January social meeting of the alumni association, held on the 23d of the month, was an enjoyable occasion. Dr. Benjamin Sharp gave an illustrated lecture on the Sandwich Islands, which was full of interest. In company with other scientists, Dr. Sharp recently visited Hawaii and made a study of its resources.

The Zeta Phi Society of the senior class entertained the students and their friends in a delightful manner last week by giving a musical entertainment, with some recitations. The talent was entirely drawn from the Zeta Phi. The society's quartet, composed of Messrs. Blackman, Rhein, Weider and Boyne, was heard in vocal selections. Mr. Campbell rendered a piano solo. Mr. Rhein a vocal solo; Mr. Thayer, violin; Mr. Barker, piano; Mr. Zeigler, declamation; Mr. Garver, declamation; Mr. Culby, guitar; Messrs. Thayer, Irvine, Miller and Thurston, instrumental quartet; Messrs. Smith, Collbach, Cully and Roseman, string quartet.

Druggist C. H. Cirkler, of Minneapolis, is opening another store and a very handsome one in the new Dayton block.

DETROIT.

"Shakespeare once said 'a little fire is quickly trodden out; which, being suffered, rivers cannot quench.' That to my mind has been the condition and the history of the cut-rate patent medicine business in Detroit," said a prominent retailer the other day. "If the business had been nipped in the bud several years ago, I do not think the present condition would have ever existed. Mark my word, Detroit is now, henceforth and forever a cut-rate town." And this is not the opinion of one man, but that of many men. If the signs of the times can be read aright the recent actions of the Detroit Pharmaceutical Society seem to indicate that a battle of no small magnitude is to be waged against the cutter. The preliminary skirmishing which led to decisive action in the matter, culminated in one of the most largely attended meetings the retail druggists have ever had. This meeting occurred February 9th, when it was agreed almost unanimously that the cutter would be met in his prices upon his own ground by the retailers present. Considerable discussion was indulged in as to whether the druggists should act concertedly or individually, and as to whether the city should be circularized to that effect. A committee was finally appointed to canvas the retail druggists of the city and report upon the matter to another meeting of the druggists called for February 16th. It is quite likely that each individual will proceed to "work" his own locality according to his own ideas and that no concerted action will be taken.

All arrangements have been made for the erection of a plant for the manufacture of bi-carbonate of soda at Trenton and work will be commenced on its erection as soon as the frost is out of the ground. Boring for a bed of salt has been carried on for several months, and at a depth of 1,185 feet a salt bed thirty-five feet thick was struck. The plant will be experimental, and if it is successful the works will be doubled next year. About one hundred men will be employed several months in putting the different arrangements in place for the opening of the works next fall. The works after completion will employ about fifty men and girls to operate them. It is also probable that the shipping department of the firm will be transferred from Brooklyn to Trenton should the experiment be a success. The works, it is estimated, will be capable of turning out from twenty-five to thirty tons a day.

George Budde, representing the Steinvogel Drug Co., called at the Era office February 3d.

Otto Kurz has opened a new store at 752 Michigan avenue. Farrand, Williams & Clark furnished the stock.

Ed Garrigues, representative of Whittall, Tatum & Co., Philadelphia, is calling upon the jobbing trade in the city.

Clarence J. Coleman, a former resident and member of the drug firm of Coleman & Devendorf, died in Chicago, January 26th.

Druggists of Menominee are considering the advisability of early closing and it is probable that the plan will be put into effect.

Brown Pharmacy Co., located at 110 Woodward avenue, corner Congress street, are to open a branch store at 180 Woodward avenue.

J. C. Moeller has opened a new drug store at C. K. Trombley's old stand, 594 Gratiot avenue. Mr. Trombley has moved to 671 Gratiot avenue.

J. B. Russell has resigned his position as superintendent of Parke, Davis & Co.'s laboratory and accepted a position with A. J. White, New York City.

Burglars effected an entrance into C. K. Trombley's store on Gratiot avenue early the morning of January 14th, but were frightened away by the police.

The Zoa Phora Medicine Co., Kalamazoo, has filed the following statement: Capital stock, \$15,000; paid in, \$15,000; personal estate, \$3,372.29; debts, \$1,035.31; credits, \$1,747.

W. Blake, druggist of Kalamazoo, left his store the night of January 27th with an oil stove burning. The store was damaged \$1,500 by fire before morning and nearly his entire stock of drugs ruined by fire and water. Insurance \$500.

On February 2nd occurred the death of Mrs. Ann E., widow of the late Alanson Sheley. She was 82 years of age and one of the pioneers in this region of country. Three children survive her, one of whom is the mother of Alanson S. Brooks, of Williams, Davis, Brooks & Co., of this city.

The fire which destroyed the store and stock of John J. Orr, at Tecumseh, mentioned in a recent issue, is thought to have originated in the cellar. Mr. Orr's loss was \$4,500, on which was \$2,100 insurance. He has made arrangements for a new store, and was recently in this city looking around after stock.

The Hazeltine & Perkins Drug Company, Grand Rapids, in its filed statement, is shown to have a capital stock of \$150,000, all paid in. Its newly-elected officers are: C. S. Hazeltine, president; C. Crawford, vice-president; M. B. Hazeltine, secretary and treasurer; H. B. Fairchild, general manager.

Frank Inglis, druggist corner State and Griswold streets, sallied forth in the defense of his rights a few days ago and brought back the following note, which explains itself and is signed by a Detroit druggist: Dear Sir—I regret very much that in some instances I have filed prescriptions calling for "Elixir of Fir Compound Inglis," with a very poor imitation of the same. I realize that this is a transgression of your rights as well as of the rights of the public, and assure you most earnestly that nothing of the sort will occur again, and feel myself bound to compensate you for any damage you may have suffered by reason thereof.

Some of the druggists in New Holland, O., are a soft lot. By the old tale of lost heirs for large estates, a plausible gentleman succeeded in getting into their confidence and also obtaining from them sundry bottles of liquor. It turns out that he was a detective, and had been employed to ferret out liquor selling druggists. Some fines have been paid and others are expected.

A nifty swindler has been operating in Massachusetts. His method was to advertise for a girl to bottle cologne. The girl, applying for the position, was required to deposit \$20. The swindler would then take his leave and never return. He travels under the name of C. Lendholt, is about 50 years of age and is said to have worked the game very satisfactorily in other places.

CHICAGO.

Chicago, February 10.—The Hyde Park marketeers have been very busily engaged for some days in hearing evidence against a large number of druggists on charges of selling liquors without licenses. The arrests number over 100 and include many well known druggists. A number of the druggists were fined \$20 each, the evidence convicting them being principally the testimony of an agent of the Liquor Dealers' Association and a detective. The druggists who have had their cases continued have held a meeting, perfected an organization and employed counsel to fight the suits being prosecuted against them. Lee M. Bonheim was chosen president, and L. F. Hogan treasurer.

Albert E. Ebert, the State street druggist, and his wife were both badly burned the evening of February 1 and Mrs. Ebert's condition is said by the attending physicians to be serious. Mr. Ebert left his drug store at 426 State street and went to his home, 376 Michigan avenue, at 10:30 o'clock. His wife served a little lunch and then he sat down to read the evening papers. Mrs. Ebert thought there was not light enough and she struck a match to light a second gas jet. It seems that a piece of the burning match fell down and ignited the bottom of her dress. The dress was made of light material and before she realized it the flames had leaped up and caught her sleeve. Mrs. Ebert is fleshy and she could not help herself very well. She called to her husband, who jumped up and tried to subdue the flames. In the shuffling that followed Mrs. Ebert fell down. During the struggle with the flames Mr. Ebert's right hand was badly burned. Mrs. Ebert's right hand and her right arm up to the shoulder were frightfully burned.

Geo. S. Lord, of Lord, Owen & Co., is spending a few weeks at Colorado Springs, Col.

Walter Sempill, of Dale & Sempill, is confined to his house with a severe attack of neuralgia.

Theodore Fisher, a leading citizen and member of the firm of Fisher & Dunean, druggists, Petersburg, Ill., died February 1, after a brief illness.

The Diamond Glue Co., of Chicago, has become incorporated with a capital stock of \$150,000. The incorporators are John Spiegel, J. R. Morron and Arnold Freshman.

O. J. Gibson, representing the Trommer Malt Co., finds it necessary to subscribe for the Era in order to be posted in the latest pharmaceutical news. Mr. Gibson makes his home in this city.

Harry Baker, a salesman in Peter Van Schaeck & Sons' wholesale drug house, 140 Lake street, has been arrested on a charge of larceny. Baker is accused of selling bills of goods and pocketing the money received.

A. R. Otis, late with Geo. H. Lohman, Kendallville, Ind., has decided to embark in the drug business on his own account. He has been spending several days in the city placing his order for a new outfit, which will probably be the handsomest in Kendallville.

Geo. H. Painter, hanged recently for murdering the Martin woman, was at one time engaged in the drug business in Brooklyn, owning a store in that city at the corner of Margueretta street and

Broadway. He was a resident of Chicago about twelve years.

J. C. H. Potter, who claims the title of consul-general of the Hawaiian government, has been arrested on a warrant sworn out by Sattler & Chalmers, druggists at 361 West Adams street. They charge him with having obtained \$25 worth of goods by false pretenses.

At a meeting of the retail druggists of Chicago, held February 6, under the auspices of the Chicago Apothecaries' Society, a resolution was adopted approving the U. T. A. plan or label system and strongly recommending that retail druggists join the association with the view of procuring its universal adoption by manufacturers, wholesalers and retailers.

BUFFALO.

Buffalo, February 10.—The drug trade is not in a strictly rushing condition. Retailers say they have a good day once in a while, and that is the best report they can make. It has been quite healthy here this winter and people are not buying drugs for fun any more than they are anything else, so the trade drags along about as everything else does. Our wholesalers are few in number and they fare better. They always report business brisk, but with a retailer on every street corner it has got to be good pocking to get much out of it. Still druggists are long suffering and, like politicians, few die and none resign, that is to say, few sell out and none fail.

There were three vanilla bean men in Buffalo last week and the way they slaughtered trade—and each other—was a caution. The first sold his goods at from \$5 to \$12 a pound and drove a fair trade. The second declared that he had a big lot obtained at auction and offered a good brand at \$4.50. The third astonished the natives by offering the very same article at \$1.75, and he was connected with one of the biggest jobbing houses in the country. Here's depreciation for you.

The sneak thief is abroad in the drug stores. A local paper has it that the plan is to get into the drug store when business is slack. The clerk is pretty sure to be at the back of the store and when he comes forward the visitor, who is a well-dressed fellow, says that he merely wants to look at the directory. The clerk retires again and the fellow watches his chance and fills his pockets with fancy articles that are usually to be found in the front part of the store. Several druggists have been taken in after this fashion this winter and they are beginning to be more watchful.

The pharmacy college students had a week of vacation the first of February. They spent the previous week in the grind of the mid-session examination and needed to take a long breath. As usual the seniors passed in very creditable papers and the juniors got up numerous surprises, some passing much better and others much worse than was expected.

A local paper makes quite a break when it announces that the Morgan memorial building, to be erected at Pearl and Niagara streets, a sky scraper if all the stories told of it are fulfilled by stories in it—is the result of a successful patent medicine business. D. S. Morgan lived at Brockport, on the Niagara Falls road from Rochester, and made a fortune in mowing machines.

This chronicle will not be complete without a somewhat detailed account of the present received last month by Dr. Itay V. Pierce, of the World's Dispensary. It is a fortune to be well known in the patent medicine business, and it is some other things besides. On January 17th a box arrived at police headquarters addressed to the chief. It had come from Bridgeport, O., and contained a letter signed D. O. Yannover, asking the chief to feed the enclosed drugs to Dr. Pierce and make sure that he swallowed them, whether he wanted them or not. The list is a very appetizing one, but is not usually included in even a doctor's bill of fare. There were two ounces of 95 per cent carbolic acid, a pint of creosote, a half ounce of croton oil, two grains of sulphate of morphia, a half pound of sugar of lead, a half pound of Paris green, a dram of chromic acid, two ounces of metallic mercury, two ounces of sulphuric acid, two ounces of nitric acid, and a half pound of something that appeared to be rat poison. In view of the large proportion of caustics in the lot it is plain that the doctor was supposed to be no ordinary subject. All the packages were lately put up, the caustics not having eaten into the corks of the bottles to any extent. There had plainly been an effort to conceal the name of the druggist, for all names had been erased from the labels. The preparations were of good quality and showed that Bridgeport knows and handles the genuine. There is no druggist named Yannover in that town and Dr. Pierce thinks the package is from some crazy crank, especially as he has never been in Bridgeport. He looks upon the affair as a poor joke, though he thinks it quite likely that nobody would have spent several dollars and taken as much trouble for the fun of the thing. An effort has been made to discover the fellow in order to look into his sanity, but nothing has come of it. The name appears to have been fictitious. This is the only sane part of the transaction, as cranks do not generally succeed in concealing their names and some do not try.

Russell Elliott, Ph. G., B. C. P., '89, has gone to Dayton, O., to buy out one of the largest drug stores in that town. The name of the house was not learned.

Low's Art Tile Soda Fountain Co. reports to the state under the new corporation law a capital of \$100,000, of which \$73,000 is issued, assets \$79,000 and debts \$39,000.

Dr. A. L. Benedict, instructor in botany at the college of pharmacy, has resigned his position as district physician in the city health department, finding it impossible to carry all these branches and at the same time attend to his practice.

Health Physician Wende has changed his lecture evening at the pharmacy college from Thursday to Tuesday so that he can have a better chance to wrestle with the aldermen on committee night. He is a very resolute physician and takes no back seat for anybody.

The county board of pharmacy received only two applicants for examination at the first February meeting. Four certificates were granted at the January meeting as follows: Pharmacists to Robert D. Douglas, assistant to Alfred F. Kuhn; Edward E. Miller and Martin Manger.

This is a bad winter for drug clerks. They are more plenty than usual and the demand is light. For this reason those

with positions are holding fast to them with all their might. Some of them are saying on the quiet that they are not satisfied with their places, but they are not going to throw them up till the times are better.

The dispensary connected with the college of pharmacy is ministering to above 50 patients daily. During the midwinter vacation Charles Kelley, of the junior class, has been engaged in putting the dispensary to rights, for which disinterested service he deserves everybody's thanks. He has done the work very neatly.

The managers of the Victor Mineral Water Co. are at a loss to know how the reputation of the water spreads as it does, for it is not advertised out of the city, but orders for quantities of it come in quite frequently from distant towns. There is a move to increase the capital and erect a sanitarium on the lot next season.

There is talk among the members of the county board of pharmacy of proposing a law that will include the rural districts in the provisions of the act requiring examinations of druggists. The proposition may not be made now, for it is said that the county druggists, especially such of them as don't know epsom salts from jalap, would oppose such a bill, and as it would benefit Erie county only in a general way the task is rather a thankless one. Perhaps the first move will be made by getting the state association interested in the idea.

One of our up-town druggists who has been taking some daring liberties with the English language and a piece of charcoal is still unrepentant and proposes to perpetrate another "ad" of the same sort. Having some shaving cups in the window he posted some charcoal drawings of a Chinaman over them and called attention to "This China Mug." Now the new medicine "Frog in the Throat," affords another opportunity and the cut of a man with a literal frog going up or going down his throat, the direction is not settled yet, will soon appear with the legend, "Take him out for ten cents" attached.

Dr. Huested, president of the New York state board of pharmacy, says that the board favors the re-registration of licentiates, but nothing has been done about it yet. Before any such measure can hope to become a law it will have to be passed by the legislative committee of the state association, of which C. O. Rano, of Buffalo, is chairman. The bill obliging patent medicine manufacturers to publish their formulas on their goods is abroad, but it may not be pushed. Though somewhat similar to the famous "strike" bill of last winter, which was fought so generally by druggists and killed, it gives no official the arbitrary power that was conferred by the other.

The county board of pharmacy is getting somewhat weary of the state board on account of its laxness and thinks it would like to give the larger body a poke if the way should offer. It is discouraging to be obliged to accept the state board's certificates and then find that they are obtained in a way that would never be thought of here. Young fellows will come to the college for about six weeks, grind hard on the subjects which are supposed to most likely come up in an examination and then go and pass the state board flying. It is believed that these lax methods are growing worse.

INDIANAPOLIS.

Druggist W. C. Burk and wife, of Thorntown, are making a four weeks' tour through the south.

T. E. Bradshaw, Thorntown, who has been confined in his room for several weeks, is on the mend now.

V. C. Meloy has bought the drug store of E. B. Doll at North Vernon. The latter remains with his successor.

The cutter still spasmodically gets big ads. In the papers and the legitimates wonder how he manages to pay for them. One case of small-pox in South Bend has caused a small quarantine and a consequent demand for virus and disinfectants.

"Very good" is the wholesalers' answer to the inquiry "How's business?" The retailers still grumble a little about the scarcity of money.

J. W. Danhour, the leading druggist in Clay City, was married to Miss Bertha Ross, an estimable young woman of Brazil, on the evening of January 31.

The case against druggist George B. Bennett, of Terre Haute, charged with using the mails to defraud, was opened on the 13th inst. Forgery is also laid at Bennett's door.

The 11 o'clock closing hour law is being strictly enforced by the Indianapolis police authorities and the saloonkeepers continue to charge that the drug stores take up the business from that hour on.

A very successful prepared food exhibit was held in the largest hall in this city on January 29, 30, 31. The products were donated by the manufacturers to a charitable society and were sold to and eaten by profitable patrons.

Manager Carey, of the "Old Gibraltar" drug house, is spending a month at the Midwinter Fair, the guest of R. E. F. Pierce, in whose private car the trip was made. In the meantime the house's interests are being looked after by "Doc" Olcutt, the manager's able lieutenant.

A coal dropped from the stove to the floor in R. A. Brennan's notion store in Evansville on the evening of January 29, starting a fire which destroyed stock and building, the west wall of which fell and crushed in the rear of Dr. Wm. Alexander's drug store, destroying \$500 worth of stock. Other buildings crushed were owned by the doctor, running his loss up to \$10,000, fully insured.

A Scotch-accented woman has been playing the silverware game on many Indianapolis people. Just landed here, without friends—must sell her old country tableware—last thing she has—in order to buy food. Makes the sale at a sacrifice (which turns out to be a good profit) and then moves on to the next innocent. Druggist J. D. Gauld, of Indiana avenue, vice-president of the Caledonia Society, was one of her first and easiest victims.

Recent mistakes of druggists have caused a revival of talk in favor of more stringent statutes governing the prescription business. The essential demanded is that prescription clerks should be educated well enough not only not to blunder themselves but to detect errors of doctors. An instance: A hurried physician writes a prescription calling for six grains of a deadly poison. Druggist called doctor by telephone to ask if there wasn't some mistake. "Great God," exclaimed the doctor, "did I write six grains. I meant one-sixth of a grain. I'll come right down."

A sensation in druggist circles was created by the arrest of George F. Yeager, 305 Virginia avenue, Sunday night last, on a charge of criminal malpractice, on information furnished by the physicians who attended Mrs. Teresa Balsler, a woman in the neighborhood who died the night before. The woman admitted to the doctor that a criminal operation had been performed on her by Yeager. Before the coroner the druggist said he had attended Mrs. Balsler without a physician's license, although he is now a student at one of the medical colleges here. He used instruments upon her, he says, but he employed no methods forbidden by law and is guilty of no crime. He charged her \$10 on her first visit to the store. On a preliminary examination he has been held for action by the grand jury. He is between 40 and 50 years of age and has a family.

"Col. Lilly," this city's famous manufacturing pharmacist, has been having a time of it the last three months. He is the commercial leader of the city, being at the head of the club that has the commercial interests and welfare of Indianapolis in hand. He had charge last year of perhaps the best-conducted Grand Army Encampment that has ever been held. He was economical and saved many thousands of dollars of the expected expense. After it was over, however, he voted \$5,000 of the savings to the club's secretary and asserted that another \$12,000 were properly the club's "earnings." The money was raised by popular subscription and by vote of the city council. There has been and still is a hubbub about it and the principal paper here scores him daily. In the meantime the Commercial Club directors have had a life-size portrait of him painted and hung in the club's assembly hall.

Druggist A. A. Gould, of North Indianapolis, had an exciting experience on the night of the 1st inst. After counting his day's receipts he "locked up" about 9 o'clock and started to his home about four blocks away, noticing casually three or four men on the corner as he walked off. At the gate to his house, which stands some lots away from others on the same street he was passed by two men. "Good evening, gentlemen," said he, but they did not answer. Instead one grabbed him by the shoulder and another held a revolver to his head. "I guess you've got me," said Andy, laughing at the joke he thought two of his friends were playing upon him. They did not speak, but endeavored to throw him. Although he had his books under one arm he entered into the "rattle" with zest. It was not until they threw him face down into the gravelled walk and hit him a stinging blow back of the ear that he began to doubt the funniness of the proceeding. Then he called out "Emma," which was his wife's name. They hit him twice again, but his better half thought she heard the muffled sound of her name when he called the second time, and opened the door. The light caused the flight of the highwaymen. The hand of the arm that held his books was in his overcoat pocket, where \$60 lay in crumpled bills. One of the robbers had his hand in the same pocket, but couldn't get the cash from the owner's grasp. Andy is still a tough looking sight and wouldn't present a much worse appearance if he had run against Corbett.

CINCINNATI.

Cincinnati, February 10.—The annual meeting of the wholesale druggists of Ohio, Indiana and Kentucky was held at the Burnet House on Thursday, January 24th. The local men present acted as an entertainment committee and saw that nothing was left undone to add to the pleasure of their visiting brethren. A scale of prices was talked about and cutting indiscriminately was frowned down. After the routine business of the convention had been transacted the following officers were elected: President, Ashley Lloyd, Cincinnati; vice-president, Fred Renz, Louisville, Ky., and George W. Lattimer, of Columbus, secretary and treasurer, board of directors, Messrs. Stein, of Cincinnati; Benj. Neat, of Louisville, and John Carey, of Louisville. The banquet was a triumph of the epicurean art. The menu was elaborate and the wholesale dispensers of drugs went from soup to nuts in a manner that was beneficial for sore optics. The decorations provided by nine host Tom Zimmerman were up to date and were emblematic of the occasion. A beautiful mortar and pestle made of white chrysanthemums and trimmed with yellow roses made a most imposing emblem on the center table of the spacious dining hall. A large traveling grip made of beautiful carnations and lilies of the valley greeted the delegates as they marched arm in arm into the banquet hall. In one corner of the room a string orchestra of forty pieces rendered some late and popular airs, while the drug dispensers feasted at the mahogany.

SAID BETWEEN BITES.—"Billy" Hale couldn't tarry very long, as he was dated for a swell dinner in Avondale.

Charley Frick, of Louisville, told some jokes he played on George Hummel, his traveling partner.

George Lattimer had a few things to say about Governor McKinley's second inauguration.

Otto Rauchfuss told how nicely he managed to get along with his partner, C. P. Calvert.

"Billy" Walding, of Toledo, said Hamilton county was O. K., but that Lucas county suited him better.

Otto Stein briefly told his troubles about convincing a well-known retailer that he was getting value received for his money.

"Billy" Schmidt, of Indianapolis, said the Hoosier capital was full of politicians who knew a thing or two.

J. D. Price, of Columbus, hummed pieces to himself as he discussed the rather lengthy menu.

M. C. Peter, of Louisville, told a few yarns about prominent druggists of the Falls City.

George Budde, the affable city salesman for the Stein-Vogeler Drug Company, has just returned from a trip to Detroit.

John Haynes, formerly a well-known druggist of this city, is now traveling for Lehn & Fink, New York Importers of drugs and chemicals. John is due in the Queen City on or about June 1st.

L. D. Shreck, the druggist at John and Liberty streets, has sold his store to H. W. Stegemiller. The latter is a clever young pharmacist who has a legion of friends in the west end.

The beautiful village of Avondale now boasts of four first class pharmacies. The new store started by Fred Fuldner

is a beauty and he reports business very good for a starter. The store is located at Hutchins and Main avenues.

A rumor has been extant in this city for some time past that M. C. Dow would soon open cut-rate drug stores over-the-hill and in Walnut Hills, and Miss Cora Dow was seen and stated that the rumor was somewhat premature.

Local druggists are making preparations for the May meeting of the Ohio Pharmaceutical Association, which will be held in this city. Music Hall will likely be engaged, and the various wholesale houses will eclipse all previous displays.

John F. Byrne, the druggist at Spring and High streets, Columbus, was in the city a few days ago in the interest of the Retail Druggists' Insurance Company. He was the guest of John Meyer, ex-member of the Ohio Board of Pharmacy.

The handsome new drug store of M. C. Dow in the Grand Hotel block at Fourth and Central avenue opened a short time ago. The fixtures were made by Bangs and are of natural wood. Miss Dow and her father now control three cut-rate drug stores in this city.

Thieves broke into Ellinger's drug store at Baymiller and Clark streets the other night and in their rounds about the pharmacy encountered the clerk, Arthur Riggs. The latter pulled his revolver and fired at the midnight marauders, but they managed to escape uninjured.

Henry Grodel, who has conducted the cut-rate drug store at the corner of Walnut and Allison streets for several years past, has sold his pharmacy to A. Brueggemann. The latter is well known here, although he has been clerking in a large retail store in New York for the past five years.

Dr. R. H. Weatherhead, the druggist at Sixth and Vine streets, is steadily increasing his real estate holdings in Walnut Hills and Avondale. The doctor generally builds a few cottages on the hill every spring. He is doubtless advised to do this by Geo. B. Keeper, the street railroad magnate, who is his bosom friend.

Michael Hornbeck & Co. have purchased the time-honored pharmacy at Main and Woodward streets, in which the late Chas. Witterstein amassed a competency. The store is one of the oldest in the city. Mr. Hornbeck has clerked in several of the largest down-town pharmacies and is quite popular with the trade.

"We've got to come to it," said Dr. John C. Otis the other evening as he was arranging his front show window with the leading patent medicines marked at cut-down prices in red ink. "You've either got to sell them at the published cut price or allow them to set on the shelf. I for one believe in turning my money over."

The Cincinnati Paint Club held its annual election and banquet at the Burnet House last Thursday night. Seated at the banquet table were nearly all of the prominent paint, oil and drug men in the city. The following officers were elected: President, John B. Elmhuy; vice-president, Ira D. Washburn; secretary, L. E. Hearne; treasurer, W. C. Peale.

W. H. Byrne, the young druggist in Clifton, says he is able to make a good speech on the annexation question. The barons of that classic village congregate at his pharmacy mornings and nights and while waiting for their cars discuss

the all absorbing annexation question. The annexation of Clifton will add three druggists to the already large list in the Queen City.

The pharmacy opened a short time ago in the new odd Fellows' Temple at Seventh and Elm streets by Martin Dodsworth, is well arranged, notwithstanding the total absence of signs on the outside of the building. Mr. Dodsworth is not a believer in external legends. His aversion to sign boards comes from his intimacy with physicians who have an abhorrence for signs.

Edward Voss, the druggist at Twelfth and Vine, is interested in the recent invention of an intestinal tube for exploring the pylorus and other intestines. Dr. George Robbman, assistant demonstrator of anatomy at the Ohio Medical College, is the inventor. The new tube can also be used for administering medicine. It was tried at the City Hospital a few days ago in the presence of a number of physicians and druggists.

A number of retail druggists in this city are complaining about the scarcity of retail clerks. A movement is on foot by which these pharmacists expect to make satisfactory arrangements with colleges of pharmacy students to act in the above capacity. The movement is now in its infancy, but every druggist spoken to is in favor of the plan. The druggists who need retail clerks are as a rule conducting small pharmacies on the hill tops and in the suburbs.

Since Wilmot J. Hall has become the owner of two flourishing retail drug stores he hasn't had time even to attend the theater. The store at Fourth and Walnut, conducted for a score of years by the late Ernst Wilfert, promises to be a big winner under Hall's conservative manager. Hall's Pharmacy at Fourth and Elm is also a paying store, but Wilmot is so busy extolling the merits of Forbes' Diastase that he pays little attention to the details of the business.

The old Hermance drug store in Covington is for the second time in the hands of an assignee. This pharmacy has been located at Fourth and Scott streets for almost a half century and is one of the best known stores across the river. The business since Mr. Hermance's death has been operated by Edward W. Knese, a well-known druggist. The business has not been prospering of late and an assignment was made to the Covington Trust Company for the benefit of creditors. Dull business and slow collections caused the second failure.

Gustav Fechter, a drug clerk living in Newport, was arrested a few days ago at the instance of the Standard Drug Company. Fechter has been out of work for the past five months. He formerly worked for Hale, Justis & Co., but was discharged because the firm thought he was stealing from the house. There was no positive evidence, however, that he ever robbed the last named firm. For the past few weeks he has been visiting the Standard Drug Company and on each trip he would ask to use the telephone. His request was always granted and it is claimed Fechter would seize packages on his way to the instrument. When the firm took stock some time ago they discovered some stuff missing and the finger of suspicion pointed toward Fechter. He called later and was caught taking an ounce of phenacetine. His arrest followed. Fechter is a married man.

CLEVELAND.

Cleveland, February 8.—Abbott's perennial pharmacy bill has made its appearance before the general assembly. Under its provisions every person practicing or engaged in pharmacy must be registered.

Prof. Treat, of Geneva, is gaining gratifying results with his chemistry class.

The Glidden & Joy Varnish Co. had its corporation name changed to the Glidden Varnish Co.

A decision of the Supreme Court as to the validity of the state cigarette law is early expected.

Harry J. Seaman, representing J. M. Combs & Co., of Los Angeles, Cal., is among late arrivals.

Harry Woodburn, of the office personnel of Benton, Myers & Co., died January 27th of typhoid fever.

Resolutions were drafted and adopted by the C. P. A. on the death of Levi E. Hinkle, at its last meeting.

Michael Gerstaker, of the west side, hopes to be at his post of duty within a short time. Kidney trouble is his ailment.

Chris. Emde, formerly manager of Fred Emde's pharmacy, has entered the employ of Geo. Voss, the Woodland avenue druggist.

H. W. Stecher is undergoing ocular treatment. His many co-sufferers among the drug trade know how to sympathize with him.

Mrs. George Grand-Girard, the wife of the Circleville druggist of that name, has lost her reason through fright. A tramp is the cause.

Dryfoos & Richmond have opened laboratories and storerooms at Canal and Seneca streets. They will principally manufacture chemicals.

The Pekin Chinese Medicine Co., which claims origin in Pekin, China, has selected Cleveland as headquarters for the United States and Canada.

The engagement of Miss Maud McKevim, daughter of W. W. McKevim, the Youngstown druggist, and Bert E. Lee, a Chicago lawyer, is announced.

Strong, Cobb & Co. have declared a 10 per cent reduction in wages. This was made necessary by a deterioration in values rather than a contraction of trade.

F. M. Goblright, representing A. C. Meyer & Co., Baltimore, Md.; Ed. Giltner, representing F. J. Cheney & Co., Toledo, O., are guests of the Striebinger House.

Fred C. Emde, who recently sold his drug store in the east end, will erect a \$3,000 building on East Prospect, corner Watkins street. It is said that Mr. Emde will re-engage in the drug business at a near date.

Schellentrager & Hoehn is now the name over the door of Fred Emde's old place in the east end. George Hoehn has transferred his activity to the newly acquired quarters and has Henry Toedtman, formerly of Fort Wayne, as assistant.

The quasi subsidized press of the state is vehemently opposing the passage of either of the medical registration bills, although both allow advertising. The reasons therefor are obvious. The issue is fought on the ground that class legislation is un-American.

An enterprising individual has been going the rounds selling celluloid insoles at fifty cents a piece with the proviso that Meyer & Glem, as Cleveland agents,

would replace any unsatisfactory article free of charge. Meyer & Glem find the fellow a rank impostor.

Fred C. Schellentrager, a son of E. A., has engaged with Nielson, the Milwaukee avenue druggist, Chicago. Chicago experience, they say, is to a druggist what Boston experience may be to a pedagogue. Besides Freddie will learn the contrast between an indulgent home and the cold, strange world.

The demise of Levi E. Hinkle, the promising young Pearl street druggist, came as a shock to the trade. Although he had been indisposed for several months prior to his death, there was no cause for apprehension. Heart failure is given as the immediate cause of his death. The remains were taken to Chargin Falls for burial.

The retail trade in January fell far below expectations, with receipts about 20 per cent short of last month, not considering the holiday influx. This condition will hardly ameliorate during February and not likely during March. The spirit of economizing becomes more intensified with the continued stagnation and the grinding down of wages. Even necessities are curtailed or dispensed with, and were it not for the clement winter, the many serious neglects of a dietary, hygienic or sanitary character would naturally entail a frightful number of fatalities.

E. A. Schellentrager may be made a party to the interesting controversy now pending between his friend Ernst Fuchs, the celebrated sculptor, and the Frenchman, MacMonnies, who is charged with appropriating Fuchs' model of the Columbian fountain and carrying it into execution without an apparent attempt to deceive through alterations. On his last pilgrimage to his native haunts, Mr. Schellentrager met and befriended Mr. Fuchs, and was then made acquainted with the plans of the young sculptor relative to the Columbian fountain and the Spectatorium enterprise which was never finished. It is probable that Mr. Schellentrager will appear before the court of arbiters to be convened upon Mr. Fuchs' arrival.

ATLANTA, GA.

Atlanta, February 8.—On the night of January 9th Jacobs' Pharmacy, one of the largest drug stores in the south, corner Peachtree and Marietta streets, was badly damaged by fire. The third floor was completely wrecked and the first and second floors and stock were badly damaged with water, the loss being estimated at \$100,000 with an insurance of \$50,000. The firm secured temporary quarters a few doors from their old stand, where they remained until February 2d, when they moved back into their former place of business. On the following day the building collapsed, entailing another loss upon the firm. Fortunately no one was injured.

W. G. Norman has opened a new store at Hickory, N. C.

E. M. Berry has opened a new store on Peachtree street.

Thomas Reese has opened a new pharmacy at Charlotte, N. C.

McFall & Thomas have opened a very handsome store at 238 Main street, Danville, Va.

C. M. Law, representing Tarrant & Co.,

of New York, has been in the city for several days.

T. C. Pace, druggist, Richmond, Va., died from the effects of spinal disease a few weeks ago.

P. W. Gray & Son are opening a new store, corner Broad and Summer streets, Nashville, Tenn.

R. V. D. Jones, of New Berne, N. C., has accepted a position with J. C. Munds, Wilmington, N. C.

David Bros., Morgantown, N. C., were damaged by fire to the extent of \$500. Covered by insurance.

The Pemberton Medicine Co., of this city, has been incorporated under the name of the Wine of Coca Co.

Dr. W. A. Wright, Barnesville, Ga., has torn down his store on Main street and will put up a handsome building.

Max Bloomstein, Nashville, Tenn., who was burned out some time ago, has opened up again, opposite his old stand.

Marcus Wight, manager of the advertising department for the J. C. Ayer Medical Co., Lowell, Mass., is in the city.

M. O. Johnson, of South Carolina, more recently from Atlanta, has accepted a position with W. C. Munds, Wilmington, N. C.

W. E. Brown & Co.'s pharmacy, Manning, S. C., was destroyed by fire several days ago. Partially covered by insurance.

William Carmichael, agent for the Gate City Oil Co., McDonough, Ga., shot and fatally injured Chas. Vestbrook, an employe.

The King's Royal Germetuer Company has removed its office and warehouses from 40 North Broad street to 77 Edge-wood avenue.

Wineman's drug store, on Central avenue, Summerville, S. C., was totally destroyed by fire January 16th. Covered by insurance.

H. M. Lee, formerly in the employ of Chas. O. Tyner, will shortly open a new store in the National Hotel building, Peachtree street.

The city council of Nashville, Tenn., has appropriated \$5,000 for vaccinating purposes, to prevent the spread of small-pox in that city.

A. S. Thomas and P. C. Sneed, Durham, N. C., have formed a co-partnership and purchased the business of E. D. Fisher in the same town.

H. M. Lee has opened a strictly prescription store in the National Hotel building, Peachtree street. He styles it "an ethical pharmacy."

Dr. W. H. Ingram, professor of pharmacy at the Atlanta College of Pharmacy, was married February 5 to Miss Loy McAfee, of this city.

Dr. W. H. Nicolson, Louisburg, N. C., has built and now occupies the store corner Main and Nash streets. It is under the management of A. S. Davis.

A. L. Scott, formerly with H. L. Fentress, Wilmington, N. C., has resigned his position and will probably open a new drug store in the near future. He will be succeeded by Mr. Higgs, formerly in the employ of the Wilson Drug Co., Wilson, N. C.

The druggists and city council of Columbus, Ga., are in a wrangle about furnishing that city with medicines for 1834. One bid, signed by all the druggists for \$1,500 was sent in. This was neglected because it was too high, and new bids were advertised for. There is talk of a city dispensary.

MICHIGAN UNIVERSITY NOTES.

Ann Arbor, February 8. Perhaps the most substantial advance made in the direction of general employment of the metric system by the pharmaceutical and medical professions was its absolute adoption by the Committee of Revision for the Pharmacopoeia of 1890. In spite of the fact that it has been taught for years in all teaching institutions of pharmacy, it has never received the practical encouragement from either profession that it deserved. In view of those facts it is pleasant to note that the metric system exclusively is taught and used in the Medical Department of the University of Michigan. A united effort on the part of all colleges of medicine, together with the influence exerted by the pharmacy schools, must gradually tend to the universal employment of this, the only scientific standard of weights and measures.

The fine prescription case and work table that were manufactured according to Prof. Stevens' own designs and presented to the School of Pharmacy several years ago by T. H. Hinchman, of Detroit, have been removed from the museum on the third floor to more convenient quarters in the pharmaceutical laboratory on the first floor. The abundance of light and space, and the close proximity to the pharmacy storeroom make the location admirably adapted for successful work in the art of dispensing. Beginning with the second semester, the seniors will receive daily drill in compounding difficult prescriptions taken from the files of our city drug stores.

Three of the large cabinet cases that contained a part of the educational exhibit of the University at the World's Columbian Exposition have been placed in the Pharmacy Museum, thus giving much needed display room for the rapidly growing collection.

Of the graduating class of 1893, we are able to report the following appointments to higher positions of credit: Geo. Wagner, Ph. C., assistant to Prof. W. K. Higley, Ph. C. '83, in botany and pharmacognosy at the College of Pharmacy of Northwestern University, Chicago; Chas. E. Jackson, Ph. C., chemist with W. C. Merrell Chemical Co., Cincinnati, O.; Carl E. Smith, Ph. C., with E. R. Squibb & Sons, Brooklyn, N. Y.; L. D. Havenhill, Ph. C., assistant in pharmacy, University of Michigan; D. L. Davoli, Jr., assistant in qualitative analysis, University of Michigan; B. C. Hesse, Ph. C. '89, B. S. '93, fellowship in chemistry, Chicago University.

With but one exception, all of the graduates in chemistry in 1893 are engaged in chemical teaching, as follows: D. Anderson, Jr., University of Wisconsin; Henry H. Denham, Cornell University; Miss Mary F. Leach, Smith College; Samuel Osborn, University of Nebraska; Joseph F. Merrill, University of Utah; Paul H. Seymour, Lake Forest University, Chicago; Geo. O. Higley, University of Michigan.

The university has just cause for being congratulated upon receiving from Mr. F. Stearns, of Detroit, his magnificent and valuable collection of mounted fishes and water color paintings of fishes. Mr. Stearns has always been a loyal friend to the university and takes great interest in its affairs and growth. The pharmacy department, especially, has been most generously remembered upon several

occasions, and to him we owe, in a great measure, the equipment of our museum. He not only personally furnished all the wall cases that contain the various exhibits, but was instrumental in securing for the school the Stearns collection of crude drugs from the firm of F. Stearns & Co., Detroit.

The junior pharmacy class were examined just before the holidays. In the short course preceding pharmacognosy proper and which treats of the source, manufacture, pharmacopoeial requirements, doses, adulterations and identification of the salts and solid acids of the Pharmacopoeia. As a part of the practical test of their ability to identify these drugs, it became necessary for them to taste nearly all of the fifty to sixty specimens submitted for examination. This is an ordeal not anticipated with great pleasure. However, the satisfaction of being able to positively identify at least the required 75 per cent of fresh samples more than compensates for the discomfort experienced. They are now reviewing the morphology of the plant, preparatory to practical work to be taken up in the microscopical laboratory.

A. E. Mummery, Ph. C. '86, who has been with Frank Ingalls, of Detroit, for the past two years, contemplates opening a new drug store on Washington street, this city.

BOARDS OF PHARMACY.

Minnesota Board of Pharmacy held its first practical examinations at the college of pharmacy at the state university January 16. Previously the examinations have been principally written, but in the future practical work in compounding and dispensing prescriptions will be a most important feature of the examination. The class numbered forty-five, and twenty-two out of this number passed as full-fledged pharmacists: Harry H. Hazeltine, Edward H. Houghton, Ernest F. Haglund, William F. Michel, Fred W. Schmidt Martin Nelson, all of Minneapolis; C. Prescott Wyman, Duluth; John Frisch, St. Charles; James Henderson, Paynesville; Adolph G. Laack, Rochester, and Larry L. Urheim, Eau Claire.

Assistants: Arthur Archibald, Louis P. Haish, Patrick Dube, Henry T. Kertson, Minneapolis; Peter R. Lorensen and Nels Nelson, St. Paul; Herman N. Tollefson, Kasson; John McGraw, Winona; Eugene Pfeiffer, New Ulm; James H. Tyrrell, Grand Meadow; Thomas J. Griffith, Mantokato.

In future, or until further notice, the examinations will be conducted in the laboratory of the college of pharmacy, state university, Minneapolis, and will consist of the reading and compounding of prescriptions and the manufacture of simple official pharmaceutical preparations. In practical work the candidate will be marked on methods employed, accuracy and general appearance of the finished product or prescription. In addition, the candidate will be given the usual examination in pharmacognosy and both oral and written questions in pharmaceutical chemistry, theoretical pharmacy, posology and toxicology.

Examinations are held every ninety days, commencing on the third Tuesday in January, April, July and October.

The North Dakota Board of Pharmacy has postponed its regular meeting to March 14 at Fargo.

Missouri Board of Pharmacy will hold its next examination meeting Monday April 9, in Kansas City at the Coates House. The examination will be based on the pharmacopoeia of 1890.

Michigan Board of Pharmacy meets at Grand Rapids, Tuesday and Wednesday, March 6 and 7, for the purpose of examining candidates for registration. Examinations will also be held at Detroit (Star Island) June 25 and 26; Houghton about September 1; Lansing, November 6 and 7.

Illinois Board of Pharmacy at a meeting held January 9th for examination passed as registered pharmacists C. W. Armstrong, Decatur; C. A. Dresbach, Decatur; E. E. Kennedy, Bethany, and E. H. Thomas, Argenta. Passed as assistant pharmacists: E. M. Bunnell, Dixon; H. H. Pinney, Wilmington; S. Suter, Bloomington, and W. G. Williams, Quincy.

The Iowa Pharmacy Commission has issued certificates to the following successful candidates who passed its examination January 19 at Des Moines: L. A. Cushman, Sanborn; C. Ootole, Estherville; I. N. Wickman, Oskaloosa, E. C. Will, Marshalltown; S. H. Bell, Van Horne; O. M. Drummond, Mount Pleasant; Edward Buckner, Bellevue.

The New Hampshire Commission of Pharmacy, at a session held in Concord, January 24, declared the following candidates to have successfully passed the examination: John C. Parker, Farmington; E. S. Woodward, Lancaster; C. S. Perry, Hillsboro; J. J. Kernin, Manchester; E. H. Thompson, Wolfboro. Those passing the junior examination were P. H. Brown, Farmington; A. W. Vittum and W. F. Plummer, Dover.

Pennsylvania Pharmaceutical Examining Board held an examination in the Central High School at Philadelphia on Saturday, January 29, 1894. Three hundred and forty candidates appeared for examination, 167 applying for Registered Pharmacists' Certificates, and 173 for Qualified Assistants' Certificates. Twenty-six of the former and sixty-four of the latter class were successful. The next examination will be held at Harrisburg in April.

The Oklahoma Board of Pharmacy met in regular session at El Reno January 2. There were present for examination thirty-four, of which fourteen passed a satisfactory examination. Six others registered by virtue of being graduates of reputable schools of pharmacy. Following are the names of the successful ones: G. W. Baker, Alva; W. R. Kelly, Watonga; A. J. Kirkpatrick, Oklahoma City; R. M. Scott, Oklahoma City; A. L. Engle, El Reno; L. F. Michael, Ponca City; Geo. Lage, Newkirk; T. H. Varner, Stillwater; Charles A. Doty, Fond Creek; R. D. Reynolds, Cloud Chief; L. E. Garnett, Perry; E. R. Thomas, Perkins; E. R. Case, Newkirk; F. B. Beller, Perry.

Graduates: L. J. Hord, Cross; J. H. Miller, Newkirk; H. L. Rankin, Gray Horse; W. A. Ziemondorf, Enid; J. A. Settle, Yukon; A. H. Engle, Perry.

This was the largest attendance since the organization of the board. The next meeting will be held at Perry, Oklahoma, on the 3d day of April.

Connecticut Pharmaceutical Association held its eighteenth annual meeting in the Y. M. C. A. building, Hartford, February 6 and 7.

TRADE COMMENT.

DIRECTORY SUPPLEMENTS.

The third (1890) edition of the Era Druggists Directory has now been issued, and the regular publication of the "Supplements" to this new edition was begun in the (February 1st) issue of The Pharmaceutical Era. We solicit from our readers information regarding any changes among the drug stores in their locality, such as new stores, removals, sales, failures, deaths, etc., etc. Address

D. O. HAYNES & CO., Publishers,
DETROIT, MICH.

A new bottle stopper has been patented recently which is made of fibrous pulp, compressed into shape, permeated by a liquid and acid-proof material and hardened by baking.

The Yergin Chemical Co., Incalls, Ind., is erecting a plant at that place for the manufacture of heavy chemicals, such as coppers, sal soda, glauher salts, phosphate of lime, etc.

Grand-Girard & Co., wholesale commission druggists and manufacturers' agents, is a new concern at Grand Rapids, Mich. They buy and sell drug stores and handle specialties on commission. The business is under the supervision of J. A. Gibb.

Behold, the fool saith: "Put not all mine eggs in one basket," which is but a manner of saying, "scatter your money and your attention," but the wise man saith "put all thine eggs in one basket—and watch that basket."—Pudd'nhead Wilson's Calendar for February.

The tank steamers which carry petroleum from the United States to foreign countries are now utilized on the return voyage from certain ports for the carriage of molasses. As nearly one-half of the importation is made into rum, and the other half refined into sugar, the presence of a little oil is not of much moment.

In the protest entered by Charles Cooper & Co. and the Roessler & Hasslacher Chemical Co. against a decision of the collector of customs, New York, in assessing duty of ten cents per pound upon acetate of copper or verdigris, the claim was made for free entry under the regulation exempting from duty "verdigris, or subacetate of copper." The general appraiser ruled that the merchandise was acetate of copper, also commercially known as verdigris, and the only verdigris entitled to free admission is that which is subacetate of copper. The protest was overruled.

Following a well-established custom Bradstreet's has presented a table of failures occurring during 1893, which endeavors to show the primary causes of these unfortunate commercial episodes. The record is as follows:

FAILURES DUE TO	No.	No.	No.	No.
	1893	1892	1891	1894
Incompetence.....	2,546	1,316	2,021	2,405
Inexperience.....	940	532	522	614
Lack of capital.....	5,194	3,436	4,869	4,052
Unwise credits.....	726	410	509	572
Failures of others.....	446	196	259	295
Extravagance.....	128	148	251	232
Veget.....	481	311	383	390
Competition.....	191	189	198	246
Disaster.....	3,463	1,374	2,175	1,388
Speculation.....	181	197	341	674
Fraud.....	1,142	1,083	875	416
Totals.....	15,598	10,270	12,894	10,673

The Berry anti-trust law enacted by the Illinois legislature in July, 1893, contains a clause which exempts a debtor from payment for any article purchased of a firm or corporation which may, under that law, be considered as being in the nature of a trust. The Appellate Court of that state has decided that an honest debt cannot be repudiated under protection of such legislation. The fact that an article has been bought from an unlawful combination will not release the purchaser from liability for payment. The court held that if a corporation or firm "is abusing the privilege which it enjoys of doing business in the state, a remedy can probably be found to prevent future, if not punish, past abuse; but it is not an outlaw, having no right to sue for property it owns." The Supreme Court will probably be called upon to pass judgment upon these points.

Retail merchants are always on the lookout for attractive show-cards to call attention to their window displays, and as these must be varied constantly, no special expense must be incurred in their production. A novel and effective card, says *Painting and Decorating*, may be made on bevel-edged Bristol board. A pencil line should be drawn lightly about an inch and a half from the edge as a border, and a sheet of parchment tracing paper should be cut the exact size of the rectangle thus formed. Now, diagonally across the card, inside the border line, is painted with strong red or blue color a stripe perhaps an inch and a half wide. The tracing-paper is then glued to the card by a narrow line of glue just around the edge, and an ornamental border of some plastic relief material is applied and finished in gold or silver bronze. The lettering is then done upon the face of the tracing-paper in water colors, with a slight sprinkling of metallics. The effect is remarkably good, the parchment tracing-paper having a satin-like luster that is exceedingly attractive, while the stripe of color shows faintly but at the same time distinctly.

PEANUT OIL.

The importance of peanut oil as an European industry has become so great that the state department promises at an early date to publish reports from consular officers at Liverpool, Marseilles, Bordeaux, Bombay, Mozambique and other points upon the extent of the industry in their localities and the methods employed both in the cultivation of the nut and the manufacture of the oil. The climate of our southern states is peculiarly adapted for the growing of the nut, and it is hoped that extended knowledge as to the best methods of cultivation will increase its value as an agricultural product. The eminent economist, Mr. Edward Atkinson, predicts greater wealth-producing capabilities in the manufacture and use of peanut oil than can be expected of the cottonseed oil industry, and in this connection says: "The more I deal with these nitrogenous plants deriving their nitrogen from the atmosphere, the more it becomes apparent that the whole system of English political economy will be revolutionized, the Malthusian dogma disappear, the Ricardian theory of rent vanish and the so-called law of diminishing returns from land be reversed. In this view the peanut article becomes the beginning of a discussion of paramount importance."

FAIRCHILD BROS. & FOSTER.

If an illustration were wanted of the theory that success will come from a concentration of effort upon one particular object, or if an example were sought to prove the truth of the old saying regarding the doing of one thing and doing it well, the firm of Fairchild Bros. & Foster, of New York, would quickly suggest itself to members of the drug trade. The business methods which have characterized the growth of this firm are of a kind which naturally calls for the approval of the trade with which they have come in contact. There has always been a well-defined belief in the minds of the pharmaceutical profession that a business house that confined itself to the manufacture of one class of products would from necessity be compelled to do their best if they remained in the business, or in other words their continuation in business would depend upon the quality of their products. A record commencing with a small beginning, extending over a period of sixteen years, and which from the present point of view contains both a retrospect and a prospect of success, is that which belongs to the firm whose name appears at the head of this column.

The Fairchild Bros., Benjamin T. and Samuel W., are natives of Stratford, Conn., and received their early education in the schools of their native town. The elder, Benjamin T. Fairchild, decided, upon leaving school, to adopt pharmacy as a profession, and knowing the advantages which existed in Philadelphia for pharmaceutical training, he spent four years in that city under the preceptorship of O. S. Hubbard and Alfred B. Taylor, during which time he graduated from the Philadelphia College of Pharmacy. Upon leaving Philadelphia he entered the employ of Caswell, Hazard & Co., New York, and later that of Caswell & Massey, with whom he remained as chemist until 1878, when he embarked with his brother in an independent business. The younger brother, Samuel, also obtained his pharmaceutical training under the tutelage of Alfred B. Taylor and the Philadelphia College of Pharmacy, and his business education was obtained through a five years' course in the employ of Caswell, Hazard & Co. and McKesson & Robbins, of New York.

The firm of Fairchild Bros. was established in 1878, and this association of two brothers whose business and social lives had been spent in close relationship and whose qualifications embraced a thorough knowledge, both of the scientific and commercial aspects of pharmacy, did much to contribute to the success of the new firm. After three years of steady progress, Macomb G. Foster, who had been three years with the firm of McKesson & Robbins, was admitted to the firm, which then became known as Fairchild Bros. & Foster. This change in the firm greatly increased its capital and gave greater scope for the business capacity of its members, and in 1881 the manufacture and introduction of pharmaceutical specialties had assumed such proportions that the firm established itself at 82-84 Fulton st. and began making a specialty of the "digestive ferments." The success of this class of products is well known to all connected with the medical and pharmaceutical professions, and the favorable relation which the name "Fairchild" bears to these products is largely due to the personal sci-

titic labors of the members of the firm, and to the sound business principles which were employed in their introduction. In building up a successful business in manufacturing pharmacy this firm shows an example which is well worthy the emulation of those whose success is yet to come along similar lines. Such a business needs a strong and loyal hand to direct its scientific interests, and in this instance the place is ably filled by Benjamin T. Fairchild. An enterpriser of this character needs an astute business manager, one who is well acquainted with the trade, and can successfully plan and carefully guide its business policy. This position is admirably filled by Samuel W. Fairchild. The successful firm also needs one to superintend the details of its manufacturing operations, and in such a position Macomb G. Foster contributes much to the success of the firm.

NEW PROCESS FOR MAKING CITRIC ACID.

Dr. Carl Wehmer, a Hanoverian botanist, is said to have recently discovered that sugar solutions exposed to the action of certain microscopic fungi, the spores of which float in the atmosphere, become transformed into citric acid precisely identical with that extracted from the lemon, says a recent United States consular report from Rome.

The first experiments made to prepare citric acid artificially in this way are said to have given excellent results, eleven kilograms of sugar producing six kilograms of crystallized citric acid.

The new process has already been patented in several countries, including Italy; and at the factory of Thann the distinguished chemist, Scheuren-Kestner, is now carrying on experiments with a view to applying the process on a large scale. Everything tends to show that this new process will assume great development, and will make it possible to supply the trade with citric acid at a much lower cost than that actually ruling, and will in all probability supersede, in a few years, the present method of producing lemon juice and citrate of lime.

In the year 1887, from Messina alone, 4,438 pipes of 130 gallons of lemon juice (used to fix colors in calico-printing), and valued at \$625,834, were exported. A large quantity of crystallized citric acid was also exported. The success of this new process will prevent new investments being made in the industry of lemon growing, which must receive a great blow from this new method of preparing citric acid, and thereby sustain heavy losses.

Unmerchandise lemons are turned to great account, in Sicily particularly, by extracting the essence from the peel and by converting the juice into concentrated lemon juice. Should this resource now be taken from the Sicilian lemon-grower, he will indeed sustain a heavy loss.

While Florida and California lemon-growers will not be affected by this new industry, should it ever prove all that is claimed for it, because their industry is still in its infancy, the question appears of sufficient interest to arrest attention.

The output of the manufacturers of druggists' and stationers' rubber goods in the United States in 1893 amounted to over \$1,500,000.

LITIGATION IN THE U. S. CAPSULE CO.

There is some dissatisfaction among the stock holders of this new capsule company, and the courts have been appealed to for relief. As stated in our issue of January 1, the United States Capsule Co., a New Jersey corporation, was recently organized for the purpose of consolidating the Merz Capsule Co., the Warren Capsule Co. and the Michigan Capsule Co., of Detroit, and National Capsule Co., of Indianapolis.

"The reason for this consolidation," state the company's attorneys, "was that the several companies above mentioned possessed different patents and operated under different processes, each of which had its especial merits and points of advantage. It was desired to unite all of the advantages which were possessed by the various processes belonging to the respective organizations in order to produce a better capsule, and one which would more fully meet the requirements of the trade. The combined capacity of the four plants will be greater than the aggregate capacity of the plants operated separately and the cost of production more economical. After the United States Capsule Co. was organized each of the other companies conveyed all of its plant and property to the new company and received stock in payment therefor. The intention of the new company was that the old plants should continue to be operated under substantially the same management as heretofore. After the consolidation was completed and all the property had been transferred, the Merz Capsule Co. refused to deliver the property which it had agreed to convey, and for which it had executed and recorded a bill of sale, and has filed a bill to set aside the conveyance and the agreements under which the consolidation was effected upon the ground that the agreement was void, as being in restraint of trade. The litigation only affects the Merz plant. The other three plants are being operated to their fullest capacity, and are now doing a good business."

The Merz Capsule Co. states: "As a Michigan corporation, we are not allowed, under the laws of this state, to hold stock in another corporation, and when advised of this fact we requested the United States Capsule Co. to allow us to withdraw from our agreement. This request was not only refused, but on January 22 representatives of the United States Co. without any lawful papers, attempted to take possession of our plant and forcibly removed part of our machinery, ostensibly spirited away for the purpose of preventing us filling orders and to force us into the combination. We have taken the matter into the courts, and shall fight it to the end. We have already arranged to replace the machinery which was removed, and are able to take as good care of our orders as the circumstances permit. The litigation in progress affects only the hard empty capsule part of our business, and does not concern our soft goods or filled capsules."

Walding, Kinnan & Marvin, wholesale druggists, Toledo, O., have been succeeded by the Walding, Kinnan & Marvin Co.

It is estimated that the 300,000 commercial travelers of the United States sold, during the last year, 600,000,000 tons of goods and paid \$175,000,000 in railroad fare.

PACKING GOODS FOR EXPORT.

The reports of United States consuls have for many years past given considerable space to complaints as to the manner in which goods are packed in this country for export, and the apparent indifference on the part of American manufacturers to the needs and desires of foreign consumers. These complaints have caused considerable improvement to be made, but not nearly as much as the importance of the question justifies. With a view to bringing the subject into prominence, the state department recently directed the entire consular service to interview leading merchants in their respective districts and furnish information upon the following points regarding the packing of goods, viz.: (1) The means by which goods from the United States reach foreign countries, and the handling and usage to which they are subjected en route. (2) The landing of goods at seaports—whether at wharves or by lighters. (3) Warehouse facilities. (4) Shipment to interior points, and the size and weight of packages best suited to the different methods of transportation. (5) The best material for outside covering—bale, box, barrel or bag—and the necessity for waterproof coverings. (6) The customs duties charged upon containers, etc.

The replies to such inquiries have been collected and published by the government in the January number of the consular reports (Vol. 44, No. 160), which forms a valuable reference work for the counting room of everyone interested in the extension of the foreign trade of this country. It is quite apparent, from the tenor of a majority of the reports, that an export trade cannot be built up unless better attention be given to seemingly insignificant details of packing, consigning and invoicing, and the opportunity for building up such trade was never more propitious than at the present, when expected legislation seems to point toward free raw materials, with an expected effect of increased production.

Before noticing some of the suggestions contained in these reports it may be well to refer to the recent report of the bureau of statistics, which furnishes figures bearing upon the foreign trade of this country for the fiscal year ending June 30, 1893. Under the head of exports, classified as "Chemicals, drugs, dyes and medicines," the following values are given: Acids, \$91,284; ashes, pot and pearl, \$31,775; Ayes and dyestuffs, \$679,373; sinseing, \$792,928; medicines, patent and proprietary, \$1,866,061; roots, herbs and barks, \$194,715; miscellaneous, \$3,097,562. In addition to these there were exported glucose, \$2,204,216; glue, \$74,722; hops, \$2,686,867; rosin, \$3,333,367; tar, \$40,244; spirits turpentine, \$3,892,436; oil cake, \$9,688,733; cottonseed oil, \$3,927,556; linseed oil, \$54,356; oil peppermint, \$267,422; other essential oils, \$316,021; perfumery and cosmetics, \$345,041; paraffin, \$4,515,534; soaps, toilet and fancy, \$103,849. Comparative figures under the head of "chemicals, drugs, etc.," are as follows: Total exports for 1893, \$6,754,968; for 1892, \$5,673,755; for 1891, \$6,546,354. These figures are quite satisfactory as far as they go, the only trouble with them is that they are not large enough for a nation which is noted for hoisting of large things.

Quite a large proportion of our consuls report that American packing is quite satisfactory in their respective localities,

but it is noted that such reports are usually from points where a good trade has been established, which makes the question of good packing all the more significant. There are many things to be taken into consideration by our exporters which do not ordinarily enter into the packing problem at home. The effects of climate, sea voyages, the requirements of transportation, which, in many cases, is either man or mule, and methods of freight handling, which, in some countries, would make the most expert American freight and baggage-smasher turn pale with envy, must be considered, and all these points are referred to at length in these reports.

The consul at Guatemala says: "When American exporters learn how to pack and consign goods properly to the Spanish-American countries, as do European houses, which have made a special study of these matters, then, and not until then, will they be able to command their share of the Latin-American trade; but the merchants here believe that this will not be the case until the United States have to depend upon their export trade, as does Europe. Attention may be called to another most cogent reason for the failure of American manufacturers and exporters to secure a larger proportion of this trade. The credits given in Europe are for much longer terms than those allowed in the United States. The wholesale merchants of this capital who supply the interior trade of the country are compelled to give long credits; so they, in turn, have to seek long credits in Europe. Credit here would seem to be well deserved, as failures in business are all but unknown. The present financial crisis, which has wrought so many failures throughout the world, has had no apparent effect here. The commercial agencies at home might greatly enlarge their usefulness and further the interests of American trade by sending an agent here."

The consul at Paris says: "If American exporters fully appreciated the importance of properly packing all goods and merchandise shipped from the United States to European countries, the loss arising from breakage and the damage done by exposure to the elements would not only be greatly reduced, but importers on this side would have their confidence largely increased. The result would be a considerable increase in the European demand for the products of the United States."

The consul at Chemnitz, Germany, says: "Goods are shipped to the interior in covered freight cars, the cost depending upon whether they go 'fast,' 'midding fast,' or 'slow.' To nothing else does the German pay so much attention as to the packing of his goods. He acts upon the principle that a poor article in an attractive box is much more easy to sell than a good article in an indifferent box. What at first would seem waste is soon seen to be excellent business foresight. A few weeks ago I read of a plan, projected by German merchants, to experiment in the matter by packing goods of all kinds in different ways recognized as good, to send them abroad on a sort of trip around the world and test the merits of the different methods of packing. A characteristic of the German agent abroad is to find out just how his customers want their goods packed, and to

urge that, if possible, they be so packed. There is, they think, no more important factor in trade."

Our consul at Mozambique writes that "American merchants who succeed in doing business with firms in this province should pay particular attention to the packing of goods. It is the practice here for the buyer to specify exactly how he wants his goods packed, and such specifications should be carried out to the letter. The American trade is very small here at present. This is not because there is no opening for American goods, but because our merchants have not tried this market. Business people on this coast know a good thing when they see it, and our merchants and manufacturers have much to offer which they can handle to good advantage."

The consul at Hogo, Japan, suggests "drugs, chemicals and liquids could be advantageously shipped in small steel drums, the latter being emptied and returned filled with fish and other oils."

Katz Bros., through the consul at Singapore, say: "The United States should send out more travelers in order that American goods may become better known."

A prominent merchant of Hamilton, Bermuda, in commenting upon American catalogues, says: "I find that American catalogues are much better illustrated than the English, which, in many instances, give the American goods the preference, although the English goods may often be cheaper."

The consul at Frankfort, Germany, quite forcibly presents complaints from a German standpoint under two heads as follows: "First, the apparent indifference of American merchants to orders from abroad, their neglect and delay in answering inquiries or filling foreign orders, and, second, the blunt and peremptory manner in which they turn over goods ordered from abroad to a shipping agent at the nearest seaport and insist upon payment the moment the merchandise is delivered on board cars or at tide water, in accordance with American usage in the home trade. This obliges the European purchaser who orders American goods from the manufacturer to pay for them before they arrive—to buy a thing which he has not seen. This is a rank departure from European methods. And the objection to it is not fully answered when it is urged that American importers pay readily for European goods when delivered at the railway station nearest the place of manufacture. 'That is your American way of doing business,' say the complainants, 'but it is not our way,' and in times like these, when competition is so fierce in all lines of trade, the purchaser, as well as the seller, should have something to say about terms and conditions of payment."

As these criticisms are made by our own representatives in foreign countries, they may be accepted without that feeling of resentment, which would attach to the same comment from strangers or competitors. Foreigners undoubtedly want our goods, but they want better packing and desire to have a voice in the settlement of terms.

Dr. Fancher Family Medicine Co., Racine, Wis., has been incorporated to manufacture a general line of family remedies.

HINTS UPON ADVERTISING.

The impromptu speaker who, upon short notice, rises and is able to talk entertainingly and instructively upon any topic which may be suggested to him, is such a rarity that his existence is somewhat in doubt. It is usually found upon investigation that the men who, like Spartacus, "come not here to talk," and are very much surprised when called upon to speak, are really delivering words which, to their own ears, are decidedly familiar, and making gestures of which their mirrors, had they the power, might show us the duplicates. This view of things, which are apparently done upon the spur of the moment, but are in reality the culmination of laborious effort, will serve to illustrate some phases in the business of advertising. There are two kinds of advertising, the kind that pays and the kind that does not pay, and it is usually an easy matter to identify these two kinds by their respective earmarks. Like everything else in the world bearing the impress of either success or failure, the one is distinguished by hard work and study in its preparation, and the other is like the effort of the truly impromptu speaker, which makes people "fidgety" to listen to. The lawyer who would attempt to make a speech to a jury without first studying both the jury and his case would soon be without clients. The preacher who would try to preach without studying his text would soon be without a congregation. The actor who appears upon the stage without due regard for his make-up and with lines half learned, is usually treated to stale provisions. The commercial traveler who does not study the art of good address and is not scrupulous as to his personal appearance, soon finds himself without a position. In spite of all these analogous cases there are thousands of business men who are apparently possessed with the idea that an appeal in the shape of an advertisement, which is presented to, perhaps, 100,000 people, is a very simple matter that can be written up in a few minutes, and they have a somewhat vague hope that this hurried, off-hand work, done upon the spur of the moment, will so mightily please this 100,000 people that at least 25,000 of them will be led to purchase of the appellant on the strength of his appeal. Has the business man any right to expect returns from such an indifferent amount of labor? He usually looks at the sum of money expended for advertising, and thinks there ought to be something of an intrinsic nature in it to bring returns, forgetting that he does not apply the same rule to the capital he has invested in his stock of goods. He is like the man who goes fishing and neglects to take his bait with him; he returns in bad humor, blaming the man from whom he hires his boat, and anatomizes the fish for not biting an empty hook.

The moral to be derived from these illustrations is quite obvious. Exceptions prove the rule that advertising pays. At the same time analogy proves that only careful, well-considered and well-directed efforts pay. This rule is not only applicable to the large advertiser, who apparently does his work upon a systematic basis, but it applies equally to the man who spends a dollar for a ten-line reading notice and hopes at least to get his dollar back. The average retail druggist is rarely in a position where he can af-

ford to throw money away. He is learning that advertising is a necessity if he desires to keep up with the procession, and it is, therefore, necessary that he spend his money to the best advantage. As before stated, this can only be done by exercising the greatest care and giving the matter some actual hard study. The buying of quinine at a certain price per

paints and oils and has been telling the public for years that he sells "cheaper" than anyone else upon earth may profitably turn his attention to something new. Some catch phrases to attract attention will do very well as a starter. He might use an ad like Sample 1.

Or he possibly knows that many people have an idea that they can't afford to paint a house because it costs too much, and they dismiss the matter without investigating what it actually does cost. Such people might look at the statement in Sample 2.

And we venture to assert that every house-owner whose building shows a weatherbeaten appearance will take out his pencil and see how many square feet of surface his house measures. The statement in the "ad." interests him, and no man can be brought to the point of buying until he becomes interested.

The country druggist can undoubtedly do something in the way of furnishing fungicides, insecticides, etc., for the farmer and gardener next season, and it might be well to call the attention of the public to the readiness of the druggist to supply such demand. Sample 3 is given to indicate a possible field for the efforts of the country druggist as the "common chemist of the common people." It is not inferred that the margin of profit can be very large upon such commodities, but a good, brisk trade upon a small margin is worthy of cultivation. By noting these somewhat crude suggestions the average druggist can look around his establishment and find enough material for a line of advertising which can be made to bring in results all next summer. When the local board of health gets its annual scare he can advertise disinfectants. Warm weather should call forth mention of soda fountains and cold drinks, and in season and out of season he has the remedies which he makes himself as a means of keeping his name alive. Give the people something inter-

esting about specialties and side lines, and they will remember the druggist who does this when they want staple articles. But the thinking on this subject should be done now.

THE ISSUE OF

Government Bonds

was undoubtedly a beneficial measure for the country, but it does not compare with the benefits conferred by the

Agricultural Dept.

through its investigation of the best methods of destroying insects, fungous growths, etc.

All the different mixtures recommended by the Department, such as

Bordeaux,	} —ALSO—	
Ammoniacal,

Copper Soda,		London Purple
Lime Sulphur,		Etcs., Etcs.,
Etcs., Etcs.		

CAN BE PROCURED OF

JOHN SMITH, Druggist,

110 Smythe Ave. SMITHTOWN.

Sample 3.

PASTOR KNEIP'S REMEDIES.—Nat. Dr. gives the following information in reply to a query:

The list calls for Pastor Kneip's Husten-thee, Wuehluherthee, Malefiz-oel, Blut-reinigung-thee and Magentrost. They are all quack remedies of considerable reputation in Germany. The following was published two or three years ago, and was taken from the official statement concerning the nature of the preparations, made either by the imperial government or on the authority of some of the German states, we forget which:

Husten-thee.—Colts-foot leaves, 20 parts; pulmonaria officinalis (spotted comfrey), 20 parts; mullein leaves, 10 parts; foenugreek seed, 10 parts; mix and powder.

Wuehluher-thee.—No. 2.—Aloes, 19 parts; fennel, 20 parts; juniper berries, 20 parts; foenugreek seed, 20 parts; dwarf alder root, 30 parts; mix and powder.

Maelfiz-oel.—Croton oil, 1 part; oil of sweet almonds, 6 parts. Mix.

Blut-reinigung-thee.—Elder flowers, 10 parts; elder leaves, 10 parts; dwarf alder root (radix ebull), 10 parts; sandal-wood, 10 parts; buckthorn bark, 10 parts; mistle-toe, 10 parts; sloe blossoms, 5 parts; strawberry leaves, 5 parts; nettle leaves, 5 parts; juniper tops, 2½ parts.

Magentrost.—St. John's wort (hypericum leaves and flowers), 3 parts; milfoil, 1 part; juniper berries, 1 part; dog-rose, 1 part; gentian root, 1 part; vermouth (absythia artem), ½ part; equisetum, ½ part; eye bright, ½ part; little centaury, ½ part; peppermint oil, 1 part; alcohol (90 per cent) 6½ parts. Mix.

THE HOUSE OF THE SEVEN GABLES

was all right architecturally, but its forbidding appearance was due to a lack of

PAINT.

There are lots of houses in Smithtown in the same condition. Their owners should call on

JOHN SMITH, 110 Smythe Ave.

and let him show them figures on paints and oils.

Sample 1.

and selling it at a certain price per grain is a transaction requiring but little skill, and the returns are apparent upon their face, but in the matter of advertising, where the returns are indirect, the demand for skill at all stages of the transaction is quite apparent.

Perhaps one of the best preliminary steps for the advertiser is to place himself in the public's shoes and carefully note the effect of different styles of advertising upon himself. He should observe the style of the successful advertiser, not necessarily for imitation, but more for style and tone, and endeavor to improve upon it. As a rule, the best advertising for the retail druggist is that of specialties or side lines. The public is well acquainted with the general stock of a drug store, and expects "pure" drugs and the "careful compounding" of prescriptions. The payment for space in the newspapers to state these facts is simply spending money for an object, that of keeping the advertiser's name before the public, which can be attained in other ways. An advertisement calling attention to a fine lot of sponges, signed by John Jones, druggist, not only calls attention to sponges, but advertises the general stock through the word "druggist." Another point which should receive due attention is the seasonableness of the goods advertised.

The advertising which should now appear in connection with goods now in demand ought to have been thought out months ago, and it is not too early to begin experimenting, cutting and trying styles of advertising to catch the public eye next spring and summer. To begin now is to allow plenty of time for study and revision. A complete list of spring and summer goods should be compiled, and the man who is bent upon effective advertising should begin to think up his speech and speculate upon its appearance in cold type. The druggist who handles

Sixty-Four Dollars and Fifty-Nine Cents

is what it will cost to

PAINT

a house whose external surface measures 2,500 square feet. Of course a larger

HOUSE

will take more paint and a smaller one less, but the price ranges accordingly. In order to obtain this remarkable result you will have to buy your paint of

JOHN SMITH,

110 Smythe Ave. SMITHTOWN.

Sample 2.

TRADE NOTES.

EASTER DYES.

These may be obtained of the following firms, all of whom have advertisements in this issue:

O. A. OHL, Tiffin, Ohio.
PAAS DYE CO., Newark, N. J.
J. J. FLECK, Tiffin, O.

Get your order in early for Pennyroyal Wafers. See page 49.

W. P. Fuller, San Francisco, manufacturer of paints and varnishes, succeeds Whittier, Fuller & Co.

The White Rock Mineral Spring Co., of Waukegan, Wis., has adopted the picture of "Psyche at Nature's Mirror" for a trade mark of its mineral water, "Ozonate Lithia."

C. H. Mason, M. D., of Chatham, N. Y., offers 40 per cent to druggists who will send customers to his sanitarium for treatment for cancer, or will allow the same amount on his remedy for treatment. See his advertisement in this issue.

W. H. Bowdler & Co., Boston, report crude Beeswax in good demand and firm at 27 to 30 cents. W. H. B. refined 70 cents, white 40 cents. Carnauba very scarce, No. 1, 20 cents; No. 2, 18 cents; No. 3, 16 cents. Ozokerite steady at former prices.

The retail druggist who has not read the advertisement of the Eureka Chemical Co., and their offer to the retailer, whereby their extraordinarily successful Pennyroyal Wafers can be easily handled, has failed to avail himself of a chance to make a good profit for himself. Turn to page 46—"Lost three sales."

Someone has been analyzing the soda water dispensed in India, and 9,000,000 microbes were found in one pint of the beverage supplied by one dealer. There is consolation, however, in the statement that most of them are harmless and that the gas has a tendency to poison the harmful bacteria.

The Standard Thermometer Co., of Foulbody, Mass., are interested in the kind of thermometers which are handled by the drug trade. They claim that their goods are the best upon the market today, and they invite the trade to investigate their claims. They will be glad to send prices and catalogues to those who want them.

Pure Rock Candy made directly from the crystals is what the druggist is after when he desires something of undoubted merit. The D. B. Scully Syrup Co., 49-51 River street, Chicago, make this kind of syrup, and they promise to furnish all inquirers something interesting in the way of prices on rock candy and rock candy syrup.

RIVERMOUTH SACHETTE POWDERS.

Preston, of New Hampshire, is getting out a line of Sachette Powders with the above trade name. Portsmouth is a delightful, old city near the sea, at the mouth of the Piscataqua River, and Rivermouth is a name suggested by one of the old inhabitants. If you want to know about the Rivermouth Sachettes, drop a line to Andrew P. Preston, Portsmouth, N. H., and ask about them.

George Lueders & Co. have lately got out a souvenir of the World's Fair consisting of half-tone pictures of various foreign exhibits, which were represented by this firm. They are as follows: Heine & Co., Leipzig; Lautier Fils, Grasse, France; Sasserno, Piccon & Manzier, Bari, Italy, and Keulbach-Lueders, Karlovo, Bulgaria.

When ordering corks the proper thing to do is to specify a brand which will give the best satisfaction for the money expended. This information is not intended for those who have used goods made by the Williamsburg Cork Co., of Brooklyn, N. Y., as it is superfluous, but for those who haven't the advice is quite pertinent to specify "Williamsburg."

Dead Certain Corn Cure retails for 25 cents and the manufacturers, T. E. Fraser & Co., Fifty-fourth street and Second avenue, New York, put it up in W., T. & Co.'s patent corn cure bottle with retailer's name and address thereon. They make a special offer on these goods and will send three dozen for \$3, when cash accompanies the order.

The Tyer Rubber Co., of Andover, Mass., manufacture such an extensive line of rubber goods that every druggist will find their price lists and catalogue a decided help both in ordering and in ascertaining what is on the market. Satisfaction is very generally secured by specifying "Tyrian" upon all orders for such goods.

Eight gallons of superior bay rum from one pound of concentrated Extract of Bay Laurel costing \$2 are what can be realized by taking advantage of the offer of Henry Thayer & Co., Cambridgeport, Mass. It may be ordered direct or from anyone on the list of jobbers, which is shown in connection with their advertisement in this issue.

A DENIAL.

To the Pharmaceutical Era.—We notice in a recent issue of the Pharmaceutical Era that our name has been used in connection with the so-called United States Capsule Company as being one of the parties to that combination. We beg to state herewith that we are not connected with the above named parties.

Yours truly,
THE MERZ CAPSULE CO.
Detroit, February 7, 1894.

AN IMPOSTOR.

The Wells & Richardson Co., of Burlington, Vt., have been considerably annoyed through the operations of parties by the name of Dice and Manning, who have been collecting money from druggists in payment for signs advertising Faine's Celery Compound through the states of Indiana and Ohio. This firm state that they have no one in their employ who does fence sign work, and parties representing themselves as acting in such capacity are gross impostors.

The man Dice is described as follows: A well-built man, about five feet ten, dark hair turning gray, dark grayish mustache, between thirty and forty years of age, heavy, thick, coarse voice, coarse features, a very smooth talker, and a rapid and perfect sign writer. He told one druggist that his home was in Alabama and that he was working southward from Indiana and expected to be back north in the summer.

The illustrated catalogue of Mead & Co., Detroit, Mich., can be procured for the asking, and should be in the hands of every one interested in drug milling. The mills of this firm are used by many of the leading drug, glue, gelatine and sugar manufacturers with perfect satisfaction, and the firm offers to grind samples of any material sent, which they will return with statement of the time consumed in grinding.

"Klinol," the new antipyretic and analgesic, is now obtainable in both powder and tablet form in ounce vials. It is believed that this method of putting it on the market will greatly increase the demand for it, and will be highly appreciated by the medical profession. Druggists who are not acquainted with this preparation will be supplied with samples upon application. Address the Klinol Co., Cleveland, O.

THE FINEST IN DETROIT.

A. A. Brown & Co. are going to put in one of the finest drug stores in the city of Detroit. The fixtures are to be made of solid mahogany, handsomely carved. All of the latest improvements and conveniences which are of great assistance to the druggist will be embodied in the construction of these fixtures. This is one more of the many fine drug stores that have been fitted by R. X. McArthur, manager of the Excelsior Show Case & Cabinet Works, 56 Fifth avenue, Chicago, and it will pay any druggist who desires anything in the way of fixtures to correspond with him before purchasing.

THE PLACE TO DINE IN NEW YORK CITY.

Business men visiting New York city are beginning to find out that one of the costliest places to get a good dinner, with everything of the best, is the old restaurant, formerly Heckman's, now called the "Century," at No. 122 William street, in the center of the drug district, which has changed hands and is now run in first-class style by one of the best caterers in the city. There has been a restaurant in this building (the oldest in the city) as far back as the memory of the oldest inhabitant can run. Many of the leading business men, who are particular regarding their meals, may be seen regularly at this old hostelry.

A WONDERFUL SALE.

Mr. G. D. Flinn, prominent horseman at Union Springs, N. Y., writes as follows: "I have used three or four bottles of Quinn's Ointment and can say it is the greatest remedy I have ever seen. I had a mare that had a bunch on her hind leg that had not been blistered for three or four years, and with three applications of Quinn's Ointment I have it perfectly smooth." This is the general experience of the leading breeders and horsemen throughout the United States. Quinn's Ointment is having a wonderful sale. For curbs, splints, spavins, windpuffs and all bunches it has no equal. It will pay all druggists to carry it in stock, and if you desire advertising or will send the names of ten or twelve of your customers, who are in the horse breeding line, to Messrs. W. B. Eddy & Co., Whitehall, N. Y., they will forward without charge, trial packages.

Attention is directed to the new advertisement in this issue of the United States Capsule Co., of Detroit, Mich. They claim for their goods those qualities of uniformity in size and careful cut which should distinguish the perfect capsule, and they offer to send samples to support this claim. See their prices on another page.

The Star and Crescent Mills, of Philadelphia, have met with so much encouragement from the drug trade in the introduction of their Turkish towels, bathrobes, etc., to the public through the retail druggist that they are making arrangements to place their goods with one jobber in the different large cities, and are getting out a new illustrated catalogue which will soon be ready for distribution.

The attention of all interested in means of preventing the refilling of bottles is directed to the advertisement of the Hero Fruit Jar Co., of Philadelphia, in this issue. They manufacture a stopper which is neat, simple, powerful and cheap, and besides really fills the purpose for which it was intended. It will cost nothing to examine it, as they will send samples and prices upon application.

The Germa-Vici Company, of Syracuse, N. Y., manufacturers of Germa-Vici, the disease germ destroyer, have discontinued the sale of the remedy in jugs retailing for \$2, and will hereafter put it up in one-half gallon jugs only, retailing for \$1. They supply all agents with a liberal amount of pamphlets and counter advertising, and will gladly send terms to druggists who will write for the same.

What Ruskin said may not have had at the time a direct bearing upon the paint which is manufactured by John Lucas & Co., but this firm's products are of a character which show a direct connection with the ideas of this greatest of art critics. This firm performs a great service in aiding your customers in the selection of proper colors, and they also aid you to sell these colors. Send for color cards and dealers' discount.

The New York Quinine and Chemical Works are the largest manufacturers of aloin, cocaine and acetanilid in the United States, and the manufacture of quinine, morphine and their salts and santonin is confined to two firms, one of which is the New York Quinine and Chemical Works. The products of this latter firm are highly appreciated by the medical profession, and they ask the drug trade to specify "N. Y. Q." when ordering.

The College of Pharmacy of the city of New York needs neither words of introduction nor praise to the pharmaceutical profession of the United States. Its able corps of instructors and unsurpassed equipment render it a favorite institution for the student who desires to complete his pharmaceutical education. In addition to these advantages its geographical situation in the metropolis of the country gives it a prestige which is peculiarly its own. Every one desires at some period of life to visit our greatest city, and the student who has a desire to observe the methods and manners which characterize one of the greatest markets of the world and to come in contact with its cosmopolitan life will find much that is attractive in the prospect of gaining his education at this famous school.

Spruce Gum as a chewing gum has always been a favorite and probably always will be. This accounts for the success which has attended the sale of the Yankee brand of Pure Spruce Gum, manufactured by Curtis & Sons, Portland, Me. The drug trade is assured that if they will keep this brand people will buy it. Write for price list and mention the Era.

E. N. Rowell Co., of Batavia, N. Y., are quoting some prices on pill boxes which ought to place their goods in every drug store in the United States. In fact, no druggist can afford to allow the opportunity to pass by of purchasing bronze, lithograph labeled pill boxes in ten gross lots at seventy cents per gross. The firm offer to send samples, so that the quality of their goods may be judged. Write them and mention the Era.

Wherever Parmelee's Pile Suppositories have been introduced there can be found abundance of testimonials from physicians, druggists and users in favor of their effectiveness. This latter point is one of great importance to the druggist, as he always has a direct demand for this class of remedies. Parmelee's Suppositories cost \$3.50 per dozen, express paid, and retail for fifty cents. Plenty of advertising is sent with each order.

The illustration of the soda fountain in the store under Abbey's new theater, Broadway and Thirty-eighth street, New York city, shown in the advertisement of the Low Art Tile Co., gives some idea of the artistic possibilities which belong to tile work in its adaptation to the most attractive feature which a druggist may place in his store. Not only are the finest effects in mural decoration capable of being produced, but the reproduction of some of the best efforts of the greatest sculptors is made possible in alto-relievo and bas-relief by the employment of this material. A man may have, if he wishes, an art gallery and the best of that truly esthetic beverage, soda water, at the same time, and his patrons will appreciate both. It should be noted that this company guarantees that colder soda, with less ice, can be drawn from tile fountains than from those made of other material and that they ask every intending purchaser to write to them at 952 Broadway, Chelsea, Mass., before buying.

OUR DEALERS TEST IT

Yellow Pine Extract Co., Allegheny, Pa.: Gentlemen—In regard to "Yellow Pine Compound" and my trial of the remedy, I have taken about two-thirds of a bottle, and feel a great deal better, and hope to say by the time I have finished the bottle that I am entirely well. I think a very nice trade can be worked up here. Please send another quarter dozen, and also some advertising matter. Will send you, in a few days, a list of sufferers from that plague of diseases, rheumatism. Yours truly,

GEORGE B. ROGERS,

Manager Smith's Drug Store, 402 Michigan street, Buffalo, N. Y.

Yellow Pine Extract Co., Allegheny, Pa., will send full information as to prices, and plenty of advertising matter, upon application. Will also send descriptive letter, with dealer's name attached, to any persons whose names are sent us. Send for blanks for this purpose.

Druggists and jobbers are informed that the Morley Drug Co., 57-59 Franklin street, Chicago, now carry a full line of Gilpin, Langdon & Co.'s powders for percolation. Western orders are filled from this depot, thus effecting a large saving both in time and freight. If there are any druggists not familiar with the superior quality of these powders they are invited to drop a line for full particulars to Gilpin, Langdon & Co., Baltimore, Md.

The specialty of the Standard Flint Glass Works, of Philadelphia, is homeopathic vials, and they are of the opinion that there is no firm in the country that can turn out better goods. As druggists have to be continually ordering goods of this kind, as well as syringes, test tubes, inhalers, pipettes, glass tubing, etc., the prices of the Standard will be found useful in making up orders. They can be had for the asking.

The tilting syrup jars for soda fountains which were introduced but a short time ago by Charles Lippincott & Co. are such decided conveniences to the dispenser that they have met with high favor on the part of all who have used them. All druggists who are unacquainted with this new idea should investigate it, and at the same time look into the merits of Lippincott's Improved Interior Ice Box Cover and Acme Coolers, which are claimed to save 40 per cent of ice. A mild winter means high-priced ice, and the man with foresight is studying upon such problems now.

PIPERAZINE.

The trade will probably remember the numerous circulars issued by Chemische Fabrik Auf Actien, vormals E. Schering, and Lehn & Pank, concerning our alleged violation of the rights of these parties, to the exclusive use of the alleged trade mark, "Piperazine." Suit was commenced against us in or about February, 1893, under this trade mark, to which we filed our answer in April, 1893, when the same was due, and in December last, the complaint was dismissed, upon our application, by his honor, Judge Lacombe. We had, during this period, been pressing the complainant to proceed with the case, because we had absolute proof that their case was worthless, but, finally, falling in any way to bring them to trial, we obtained the order of dismissal, as above stated. By the dismissal of this suit the attacks upon us are practically admitted to be unjustifiable. We have just been informed by our manufacturers in Germany that the litigation brought against them there under the Piperazine patent by Messrs. Schering has been unsuccessful, and it has been declared by the court there that The Farbenfabriken, vormals Friedr. Bayer & Co., of Elberfeld, are not liable under Schering's patent. It is naturally to be expected that the same result would be reached by the courts in the United States should any case arise here. It is our intention, in the future, as in the past, to act only within our legal rights, and infringe no valid patents or trade marks; but, at the same time, when such unwarranted attacks are made upon us, as has been the case in this Piperazine matter, we have deemed it our duty to keep the trade informed concerning the situation, and to protect their interests, in every proper way, against unwarranted interference.

W. H. SCHIEFFELIN & CO.
New York, January, 1894.

The great increase in mail orders for Non-Secrets, Fluid Extracts and Pharmaceuticals manufactured by Irwin, Kirkland & Co., Decatur, Ill., is positive evidence that their products are of the best quality, possess superior merit and are sold at bottom prices. Their fluid extracts are made from select drugs by the most approved methods and are guaranteed of reliable medicinal properties. Special quotations sent upon application.

The Diamond and Unique brands of toilet paper are unlike any others, and have a degree of excellence in quality which makes a trial customer become a permanent one. These brands, as well as several other good ones, are manufactured by the A. P. W. Paper Co., Albany, N. Y., and their latest catalogue, besides describing their goods, tells the retailer how he can sell toilet paper for what it formerly cost him.

Iodoform, the new substitute for Iodoform, is a beautiful yellow crystalline powder, resembling somewhat Iodoform in appearance, but is completely odorless. It is practically insoluble in ether and oils and only slightly soluble in water and alcohol, but forms emulsions with oily liquids and collodion. It is well adapted as a dusting powder for the surface of wounds, etc. Full particulars regarding the chemical character of this new preparation, and clinical reports upon its application will be furnished to all interested who will address Schulze-Berge & Koehl, 79 Murray street, New York, who are sole agents for the United States.

If anything is wanted in the way of metal goods, such as bottle stoppers, collapsible tubes, etc., remember that A. H. Witz, 913-917 Cherry street, Philadelphia, manufactures a full line, and will send prices and samples upon application. His goods are handled generally by wholesalers, and orders for them may be included with those for general merchandise.

R. Boericke & Co., of 495-503 Wells street, Chicago, Ill., invite the drug trade to send for their descriptive catalogue, and become posted upon the large line of goods which they manufacture that would be profitable for the druggist to handle. People go to druggists for their medicines, and will do the same for crutches, invalid chairs, etc., if they are invited to do so.

The advertising possibilities within reach of the druggist who has a well-selected outfit of the rubber type manufactured by W. W. Dietz, of Chicago, are so great that the offer in this issue of the Era should receive careful attention. The uses to which an outfit of this sort can be put are beyond enumeration, in fact the possessor of one can daily find new uses for it. Write for catalogue and mention the Era.

The price list for 1894 of Whittall, Tatum & Co., Philadelphia, has been received. An inspection of its contents shows a very complete line of goods covering nearly every demand which druggists are in the habit of making in the way of glassware. The catalogue also shows that the firm manufactures and handles a very comprehensive line of druggists' sundries, and the trade will find it a very handy reference book when ordering goods.

The spring offer of the Celery Medicine Co., Kalamazoo, Mich., on Celery Tonic Bitters is now ready, and they want to hear from every druggist who is interested in a plan that has some profit in it for the retail trade. There is 100 per cent profit in handling Celery Tonic Tablets manufactured by this firm. They pay express charges and give liberal time to pay for them.

Every prospective pharmacist who is desirous of obtaining a thorough education should obtain a catalogue of the Illinois College of Pharmacy and carefully note the courses of study which this excellent institution furnishes. This school is now installed in a new building, with new furniture and apparatus, and has six laboratories. It grants the degree of Ph. G. with the usual requirements and also has an advanced course for the degree of pharmaceutical chemist. Write Oscar Oldberg, Dean, 2121 Dearborn street, Chicago, for full particulars, catalogue, etc.

The best soda water is made by those only who thoroughly understand the business. Ordinary soda water can be made by ordinary people who think the dispensing is confined to putting ice in the apparatus and turning a faucet. But it has been noticed that people invariably like the best and will patronize the man who makes the best. Have you done all you can to get the public to come to you for its favorite beverage next summer? Have you polished up your fountain or perhaps bought a new one and forgotten to take the proper steps to learn how to dispense what the people want? If you have, the best thing to be done is to commence studying on this important subject. There is perhaps no better way of doing this than by procuring Saxe's New Guide. This furnishes just what you want and its price, \$3, will come back to you many fold after the people discover that you are following its directions. It is published by the Saxe Guide Publishing Co., 409 Dearborn street, Chicago, to whom all orders should be addressed.

NEW PERFUMES.

Schandeln & Lind, of Philadelphia, manufacturers of "Garwood's Standard Perfumes, have just added to their list two entirely new odors, "Gardenia" and "Sweet-Scented Shrub." As their names indicate, they are of extreme delicacy and sweetness, and cannot fail to captivate the most fastidious taste. To introduce these two odors the firm are making a most liberal offer. With an order for one pint they give a handsome hand-painted glove box containing a half dozen bottles, which retail at twenty-five cents each. With an order for two pints they give one dozen twenty-five-cent bottles, put up in a handsomely decorated handkerchief box. The price of these new odors is \$4 per pint, and the profit made upon these two offers may be shown as follows: One pint costs \$4; sixteen ounces retail at fifty cents per ounce, amounting to \$3; six samples at twenty-five cents apiece amount to \$1.50; the glove box is worth fifty cents, making a total return of \$10 on an investment of \$4. Two pints cost \$8; thirty-two ounces retail for \$16; one dozen samples retail for \$3, and the handkerchief box is worth \$1.25, making a total return of \$20.25 on an investment of \$8.

The two objects for which the druggist should ever aim, that of satisfying his medical friends with first-class preparations, and satisfying himself with a good profit, are supplied by the well-known Webber Pepsin manufactured by Sharp & Dohme. Care in making a preparation which is fully up to pharmacopoeial requirements is sure to settle the question as far as the medical profession is concerned, and the prices quoted on Webber pepsin are quite as sure to settle it from the pharmacist's standpoint. In order, however, to obtain this satisfactory result all around the druggist should be careful to specify the pepsin which will do this, viz.: "Webber pepsin, S. & D."

SWEET SCENTS.

The American woman who does her shopping abroad may come in for a goodly amount of reprehension on account of her lack of patriotic spirit, but she has, nevertheless, a very clever conception of her own interests. For Paris is the city par excellence of shoppers. Nowhere in the world, not even in New York where the great emporiums stretch themselves over whole blocks, can be found finer stores or more varied and carefully assorted wares. For any line of goods to obtain prominence in one of the great Parisian bazaars it must be of the most superior sort.

But it is in its window dressing that Paris stands out pre-eminently at the head. Here it is that the inborn French taste displays itself to the fullest advantage, and lines the boulevards with creations of beauty and artistic harmony. A walk through the shopping district is like a glimpse of some enchanted mart whose wares have been foregathered from the four corners of the earth.

Unlike this country, the windows of the perfumers and hair dressers in Paris are decorated as gaily as those of the milliners, and the great combination stores usually devote one whole window to a perfumery display. One of the most noted of these Parisian bazaars is the great Carnival de Venise, situated on the Boulevard de Capucines. This house is almost exclusively under the patronage of the continental nobility, and is as familiar to the titled aristocrat from the Czar's dominions as to the Parisian woman of fashion. Some four years ago this house took up the Crown Perfumery Company's goods, of London, and to-day the passing pedestrian on the boulevard sees a whole window given up exclusively to a display of the elegant goods of this firm, which have obtained so firm a hold upon popularity as to be absolutely indispensable.

Lentherie, the famous Parisian coiffeur, whose elegantly furnished salons are the resort of the whole Parisian beau monde, is another who has given the greatest prominence to the Crown Perfumery Company's goods, as a passing glimpse at his handsome window on the Rue de Faubourg St. Honore will easily reveal.

The Grands Mallon de Blanc, another of the great stores of the French capital, has recently decided to open a Rayon de Parfumerie, composed exclusively of the Crown Perfumery Company's wares, and after placing an initial order of 20,000 francs has devoted one of their great show windows to a permanent display of these goods.

"Lost three sales." How to avoid it, see page 49.

The unique appearance of the Cacti has always caused these plants to be regarded with interest for their decorative value. The offer of McDowell-Guajardo Hnos, Monterey, Mexico, in an advertisement in this issue will therefore be of interest to druggists who are on the lookout for new features to enliven the appearance of their stores or dress their windows. Send for this firm's price list for 1894 and mention the Era.

Metal brush specialties, manufactured by the Palmer Hardware Manufacturing Co., Troy, N. Y., embrace many articles which the druggist can handle to good advantage, and this firm's catalogue should be in the hands of every enterprising dealer. The "T. M. C." dauber has long been known for its many conveniences, and is claimed to be the best made, though not the highest in price. Many druggists have found it a successful seller.

The success of the Green Fly Button, manufactured by the Fly Button Co., of Maunee, O., in previous years will make them popular candidates for the favor of the public this year. The company are willing to back their faith in the superiority of their goods by an offer of \$100 to the person who will show them something better. See their advertisement in this issue and note prices. They prepay express charges upon direct orders.

Fifty five-cent packages of German Easter Egg Dyes, free of charge, is an offer which the near approach of the Easter season will cause the enterprising retailer to regard with particular interest. J. J. Fleck, of Tiffin, Ohio, is making such an offer, and it only costs a postal card to receive from him some figures which show that there is 165 per cent profit in the transaction. Investigate this and mention the Era in writing.

When all the world is asking for Crab Apple Blossoms and Crown Lavender Salts the druggist who is not posted upon these decidedly popular toilet necessities is far behind the times; 500,000 bottles were sold last year, and the retail drug trade should have a good share of the patronage which these goods will receive this year. Write the Crown Perfumery Co., 160 Fifth avenue, New York, for price lists.

SOLID COMFORT.

The application of this name to a dissecting microscope, and then making the microscope true to its name is an action which will cause the latest production of Queen & Co., of Philadelphia, to be highly appreciated by educators and students. Among the many new desirable improvements which this instrument possesses are an arrangement of the pinion-head where it can be reached equally well by either hand and the solidity and stability afforded by wide-spreading hand-rests. The reflector is double; one face of concave glass, silvered, focussing upon the object; the other is a matt surface, of plaster, for a white cloud illumination. There are two lenses, giving when combined 13-fold magnification, or separately 7 and 13. The distance from rack-pillar to the optic axis or center of stage-plate is 15-3 inches. The price of this instrument, complete with two lenses and hand-rests, is \$12.50, and all interested in microscopy should write for full description to Queen & Co., Incorporated, Philadelphia, Pa.

Nelson Morris & Co., of Chicago, manufacture both solid and fluid extracts of beef and ask for the patronage of the drug trade upon the claim that their goods are superior to all other brands, are put up in the handsomest packages, and are sold at the lowest prices. Their Clarified Fluid Extract of Beef already enjoys a favorable reputation with both the trade and the public, and they ask for trial orders on this brand.

The Crystal-Rock Finishes and Liquid and Paste Fillers have done much to enhance the reputation of the Buckeye Paint and Varnish Co., of Toledo, O., and they will do the same for the retailer who handles them. This company manufactures a very complete line of paints, colors, varnishes, painters' sundries, etc., and they invite correspondence from all druggists who handle this line of goods. Write them for prices and mention the Era.

Some druggists make a practice of giving a small corkscrew with every bottle of medicine they put up. The reason they can do this is because they get their corkscrews of Clough & Macconnell, 132 Nassau street, New York, who manufacture some which they sell as low as 10 cents per gross. As this is such a slight expense many druggists find it pays to give them away, on account of the increased satisfaction on the part of their customers.

The fifty-page catalogue which Dr. H. L. Bowker & Co., of Boston, Mass., will send upon application gives a great deal of information regarding the extensive line of distilled soda water extracts manufactured by this firm. Bowker's Birch Beer, Root Beer, Bitter Beer, Ginger Ale and Fruit Flavors are well known to the trade and popular with the public, and should have some attention when the time comes for the selection of such goods.

Every druggist should own a good microscope, but in buying an instrument of this sort a great deal of careful discrimination is necessary. This can be exercised only after considerable study of the instrument itself and the work of the different manufacturers. J. Zentmayer, 208 S. Eleventh street, Philadelphia, calls attention in this issue to his histological microscopes, and simply asks intending purchasers to send for his catalogue and carefully study it before ordering.

Frederick Stearns & Co., of Detroit, have something to say in this issue relative to Dike's Pepsin, and its conformity to the new standard of the U. S. P., 1890. Note particularly their offer to sample your physicians with it on receipt of their names and addresses. It is kept in stock by all jobbers, and costs seventy-five cents per ounce. If unacquainted with this pepsin, send for sample for yourself and apply the U. S. P. tests, which are reprinted with the firm's advertisement.

The name of the Searle & Hereth Co., of Chicago, is well known to the drug trade through the success of their specialty, "Triticin." They also supply the wants of the pharmacist by manufacturing a complete line of standard pharmaceuticals, and their efforts in this line are having a noticeable effect in directing the trade toward Chicago as a city in which all their wants may be supplied, both in a manufacturing and jobbing line. Send for this firm's price list.

Lee's patented Glass Box Jar for antiseptic gauze is a great advance over the old methods of keeping these important surgical adjuncts, and the druggist who keeps surgical dressings in this shape is sure of the patronage of the medical profession. This box is manufactured by the J. Ellwood Lee Co., of Conshohocken, Pa., who also manufacture a very complete line of surgical goods and druggists' sundries. Druggists who have not received their latest price list should send for it.

Loring & Co., 222 Hamilton Place, Boston, Mass., call the attention of the retail drug trade to the extensive advertising which is being done in the newspapers of Dr. Edison's Obesity Remedies. This is sure to create a demand for the preparations which the druggist can easily supply. The manufacturers furnish an elegant show card for window display, and the jobbers allow 25 per cent off the retail price. Send for illustrated catalogue, and article on obesity.

There is only one kind of chocolates that can be handled with advantage and profit, and that is the best. Every druggist who handles side lines of this character, with the avowed intention of drawing trade, should be very careful not to handle goods that drive trade away. The Pettit Manufacturing Co., of Canajoharie, N. Y., have something to say in this issue upon fine chocolates, and it will pay to correspond with them for their terms and points on their plan of assisting in selling their goods.

The Eagle White Lead Works of Cincinnati, O., have been in existence since 1842, and the reputation of the Eagle Brand of White Lead rests upon a trial of its merits which has extended over half a century. The present management of this company is independent of all trusts or combinations, its prices are based upon a fair remuneration for the capital and labor expended, and the quality of goods is of a character which takes into consideration the highest competition.

Waxed floors and rugs are now the proper thing in the way of inside house furnishings. W. H. Bowdler & Co., of Boston, Mass., do not claim to know anything about the rug business, but they do claim to know something about the wax that gives the best results. They also claim that the person who makes one trial of Bowdler's Floor Wax is forever a competent authority upon the same question. The dealer who handles this firm's goods has no trouble in guaranteeing and selling them.

The No. 20 Vaseline Atomizer manufactured by Whitall, Tatum & Co., Philadelphia, is one which is adapted for a great variety of uses. All kinds of medicinal or medicated oils can be used with it, and vaseline and ointments can be placed in the bottle and melted as desired. The atomizer is furnished with detachable throat and nasal tubes, thus enlarging its sphere of usefulness. This firm call attention in their advertisement in this issue to a graduated medicine spoon which is quite popular as an advertising medium for the retail druggist. The spoon is of glass and the name of the retailer, which appears upon the bottom, is an appropriate reminder when the taking of drugs becomes necessary.

Liq. Auri et Arseni Bromidi-Barelay, or "Arsenuro," is a pharmaceutical preparation which is now receiving considerable attention from the medical profession as one which affords a feasible means of employing the therapeutical properties of gold. As the drug trade will undoubtedly be called upon to furnish this preparation as it becomes better known, the manufacturers, E. M. Johnson & Co., 28 Platt street, New York, call the attention of the trade to the remedy in an advertisement in this issue.

The Wm. S. Merrell Chemical Co., of Cincinnati, have some suggestions to make to pharmacists in their advertisement in this issue. While these of course refer to the preparations of this firm they contain many ideas of general application to the practice of pharmacy. Particular attention is directed to their offer to send to druggists, free of charge, samples, printed matter, etc., for distribution to physicians, thus giving the retailer an opportunity to work up and retain a good trade in first-class pharmaceutical preparations.

The Hammondsport Wine Co., of Hammondsport, N. Y., say that the wants of the drug trade will command their preferred attention. This means that they not only give prompt and courteous attention to all orders sent them, but that their goods are of a character which are exactly fitted to the needs of the trade. They manufacture the Ports, Sherries, White Tokay, Madeira, Sauterne, Catawbas, Clarets, etc., and they make a specialty of Cognac process brandy, and their Golden Age champagne. Remember them when anything in this line is wanted.

The element of perfect safety which is so necessary a requirement in the soda water business with its frequent accidents due to the great expansive power of carbonic acid gas, seems well assured where the patented steel fountains of the Iron Lad Manufacturing Co., 22 Cliff street, New York, are employed. These fountains are made of the best quality of steel, riveted, sweated and soldered at all joints and lined with pure sheet block tin and a patented brass bottom lends additional security. The use of an apparatus of this character will do much to relieve that feeling of nervousness which prevails when the old style with its history of accidents is used.

The offer to furnish 10 oleographs of "The Puppies" with an order for Bell-Cap-Sic plasters is still open, although the demand has called for an astonishing number of both plasters and pictures, in fact the number of the latter, which is seen on every hand, almost leads to the belief that half the people of the United States must be wearing a Bell-Cap-Sic plaster and dealers in other lines of goods are actually using these pictures in their show-windows to draw people up to examine their goods. J. M. Grosvenor & Co., of 105 Milk street, Boston, make an addition to their Bell-Cap-Sic advertisement in this issue by calling attention to their dentifice "Kremlin Cream." This preparation has already been brought to public notice by advertising in the high class magazines and the demand which has arisen for it has led the proprietors to notify the drug trade that there is such a preparation on earth and tell where it can be obtained. They send samples to druggists. Write and get a sample.

If you are studying upon the advisability of making improvements in the appearance of your soda fountain, you should write to John Phillips & Co., Detroit, Mich., and see what they can do for you. One of their artistic soda fountain taps placed upon an old or ordinary fountain will do wonders in improving its appearance and bring it up to date. One great advantage in this method of improving the appearance of a soda fountain is its comparative cheapness. Write for prices and designs.

Iatrol, besides being a perfect substitute for iodoform and similar antiseptic substances, is a compound which has a wide range of application from a pharmaceutical standpoint. It is soluble in alcohol, ether, chloroform and compounds containing them; insoluble in water, glycerine, the fixed oils and vaseline, but can be incorporated with them in the preparation of ointments, suppositories, etc.; slightly soluble in warm water, and can be used in the latter form in the preparation of antiseptic solutions. These features, with its therapeutic properties as an antiseptic and germicide, render it a preparation which is acceptable to both the professions—medicine and pharmacy. Full information regarding it may be obtained by addressing the Clinton Pharmaceutical Co., Syracuse, N. Y.

The Dawes MFG Co., 11-16 Wood street, Pittsburg, Pa., report that they are still doing a good business in druggists' glassware. They received 67 orders in ten days during the dulllest portion of the late dull season. Among the stores fitted out were those of W. P. Elsbree, Albany, N. Y.; Wilson Bros., New Carlisle, Ohio; D. M. Maloney, Indianapolis, Ind.; F. B. Stone, Howell, Mich.; T. F. Wilhelm, Arlington, Ia.; Nicolas Zender, Ottawa, Ill.; H. C. Karber, Champaign, Ill.; W. H. Kasten, Nesquehoning, Pa.; J. Delderich, Detroit, Mich.; Miller & Son, Newark, Ohio; Crenshaw & Young, Lexington, Mo.; Wickman & Co., Fowlerville, Mich.; R. F. Case, St. Paul, Minn.; R. O. Sweeney & Son, Lester Park, Minn.; T. E. Yohn, Wilmot, S. D.; Sorcen & Slodderkrass, Virginia, Minn.; J. Pallen, St. Paul, Minn.; J. R. Ross, Gibson City, Ill.; J. E. Trolen, Tisklawwa, Ill.; Reeves & Co., Carmi, Ill.; and Finney & Trader, Dennison, Ohio.

It is gratifying at a time like this when "physicians' supply houses" are springing up like mushrooms in all parts of the country, and making vigorous attempts to divert the trade of the physician from its legitimate channel, to note the courageous stand of the old reliable manufacturing house of The Tilden Co., of New Lebanon, N. Y., in favor of the retail druggist. They claim that their interest and that of the retailer are mutual. They therefore propose to put any reliable, wide-awake, aggressive retailer in a position where he may successfully compete against the class of dealers named. It is believed that the trade will do well to sustain them in this fight against the demoralizing effect of the kind of trade referred to. It would be well for all those who are interested in such a movement to correspond with the firm relative to an offer they are now making. They are now engaged in sampling the physicians of the United States, thus paving the way for the most effective warfare, through the retail druggist, on their common enemy.

"It is a curious thing," says E. N. Hurt, the label printer of Buffalo, N. Y., "that a very large percentage of the druggists of the older part of the country the eastern and southern states—use ungummed labels, while those of the newer part—the western and middle states—use gummed labels. I think that this is attributable to the fact that when the druggists' label business was in its infancy the quality was poor, and the eastern and southern people got tired of gummed labels, that would curl with the least heat and creak with the least dampness, and have come to the conclusion that gummed labels are a failure. And I do not blame them, as they have tried one after another of the label firms, and still find the same trouble. If they would use my labels they would have no further difficulty, for although they will curl and will creak under extremes, still they do so to such a small degree that it is unnoticeable, and they are such an improvement over any heretofore put on the market that I should hardly be telling an untruth if I said that they would not curl or creak at all."

YOU WANT GOOD BRUSHES.

Painters, editors and brush manufacturers and others have suggested methods of swelling with water the holding parts of paint brushes. We will not add to the fund of ideas expressed on this subject, but will suggest a better thing to do than to place brushes in water to soak. We recommend the use of brushes that do not require soaking. They are the Compressed Ferrule Brushes, made round and oval, full center and open center, sizes 3-0 to 8-0, and are made by John L. Whiting & Son Co., Boston, and sold at the same prices as old atyle brushes. They are ready to use when they sell them, and will never shrink or dry up; therefore it is never necessary to soak them. The holding parts are entirely of metal, and being nickel plated have a very neat appearance. Another thing that is uppermost in the mind of every painter, is blinding or bridling his brushes. Many ingenious devices have been invented for blinding brushes, but we think nearly every painter will agree with us when we say that no successful patent binder has yet been invented. Our experience leads us to believe that the old-fashioned way of binding with twine is the only practical way, and will not be superseded, as by this method every painter can bind a brush exactly as he wants it. A better method of fastening the twine has been wanted, as painters have been annoyed by bungling loops and tacks driven into the brush heads. The perfect way to fasten the twine binder has been discovered in the patent "Hold-fast" Bridle Catches. They are attached to the Compressed Ferrule Brushes, and all other paint and varnish brushes manufactured by John L. Whiting & Son Co., and at no extra charge. When buying brushes insist on having them plainly stamped with their name, and get brushes having stock in them exactly adapted to the purposes for which they are made, and are up to date in all improvements. The Whiting brushes received two highest awards at Chicago, World's Fair, 1893; one for best methods of manufacturing brushes, and one for best materials.

"One year's time." How to get it. see page 49.

The Beef Tea dispensed by the Columbian Exposition Soft Drink Co., at the World's Fair last summer, was prepared from Libby's Fluid Beef, manufactured by Libby, McNeil & Libby, of Chicago. The manufacturers claim that this preparation, as well as the Extract of Beef made by them, is prepared under a new process at a low temperature, retaining the albumen in a fresh and palatable form, free from rank taste or smell. Libby's Fluid Beef and plain soda or water, led, with a dash of celery, is a delightful summer drink.

We take great pleasure in announcing to our patrons and the trade that we have leased the premises at 264 Fifth avenue, Chicago, where our representative will be glad to meet all intending purchasers of marble soda water apparatus or machinery for manufacturing and bottling carbonated beverages. We call attention particularly to our display of onyx marble apparatus. Chaste in design, they are also unrivaled for durability and thoroughness of construction. Buyers will find goods ranging in prices suitable to the wants of all, and any inquiry regarding same will receive prompt attention. Note our address: A. D. PUFFER & SONS.

Perfect facilities and undivided attention to the manufacture of one preparation are two of the means by which the Royal Malt Extract Co., of Philadelphia, are enabled to turn out a product which fully meets all the requirements of medical practice. They are willing to divide these undoubted advantages with the retail drug trade and to furnish their malt extract for sale under the druggist's own label. By devoting all their energies to the manufacture of their product and saving the expense which the advertising of their goods as a proprietary preparation would entail, they are able to furnish a first-class article at a price which leaves a large margin of profit for the retailer.

PACKERS' PEPSIN.

To the Pharmaceutical Era, Detroit, Mich.

Dear Sir—We enclose herewith a copy of letter sent to Druggists' Circular, which explains itself. Will you kindly give this letter a space in your valued journal.

Yours truly,

THE CUDAHY PHARMACEUTICAL CO.
South Omaha, Neb., Jan. 5, 1894.

Editor Druggists' Circular, New York, N. Y.

Dear Sir—On page two of your January issue under the head of "A new standard for pepsin," we note and quote as follows: "It is known that large quantities of inferior pepsin made principally by pork-packers have been returned to them by their patrons."

Whether or not this is a thrust at ourselves, we do not know; but, whether it is or not, we are willing to pick up the gauntlet. So far as the Cudahy Pharmaceutical Co. is concerned such a statement is absolutely without foundation, and it is a matter of simple justice that a slur of this kind should be met and denied. Under all the varying conditions of business our returns and exchanges have not amounted to 2 per cent of our total sales. Inasmuch as you put your item in the most prominent editorial column, it goes without saying that you will give this communication the same publicity.

Yours truly,

THE CUDAHY PHARMACEUTICAL CO.

Elegant pharmacy calls for the use of many things which but a few years ago were unheard of. Many druggists think that fine containers are a tax upon the consumer. So they are, but it is a matter of fact that the consumer persists in going to stores where goods are put up in the most attractive manner. The wise dealer, therefore, will always be on the lookout for new ideas in this line, and will find in Hunt's Pleated Paper Bottle Caps, sold by McKesson & Robbins, of New York, something worthy of attention. They are made in nine colors, and the name and address of the purchaser can be embossed on each cap, which affords a neat and unique method of advertising. Send for samples and illustrated price list.

A magazine writer not long ago deplored the tendency of the American people to ignore the musical and poetical language of the primitive inhabitants of this country in applying names to our cities, towns, rivers, etc. He expressed a decided preference for such names as Onondaga, Saskatchewan, Chicago, etc., in place of Jonesville, Smithtown and other of similar derivation. He was undoubtedly right. The name Conestoga is an illustration upon this point. It is one which can be easily remembered, but for the drug trade it has a double significance. It is not only a reminder of times of the noble red man, but is associated with one of the important articles of the pharmacy, viz.: Corks. A great many druggists keep this connection always in mind, and are, therefore, always suited with Conestoga corks.

Lord, Owen & Co., wholesale druggists of Chicago, have recently inaugurated a new rule regarding shipments which their customers greatly appreciate. Realizing that many of their patrons in meeting the demands of their trade have to procure certain goods as quickly as possible, and knowing that many retailers do not care to carry large stock in certain commodities, they have announced that hereafter, as far as possible, all orders for goods will be filled and the goods shipped upon the same day the order is received. This plan has already resulted in a considerable increase in orders from points quite a distance from Chicago, as it is found that promptness in executing orders often more than compensates for the extra distance which the goods have to travel. The firm ask the trade to favor them with trial orders and see how quickly and satisfactorily they can be filled.

No class of dealers more thoroughly appreciate purity in the articles they sell than do druggists. When a customer learns that he can absolutely depend upon the goods a druggist sells him, that druggist has gained a permanent customer. Purity in his goods is therefore a most essential point in the druggists' trade. It is proper then for him to see that the whiskey he buys is of the best, as that is an article that enters largely into his business, both in compounding prescriptions, and as shelf goods. It is well known that the purest and finest whiskey in the world is that celebrated brand, Clarke's Pure Rye. Colburn, Birks & Co., of Peoria, Ill., who are the sole distributors of this whiskey, desire but one trial to be given it to prove their oft-repeated assertions that Clarke's Pure Rye is the

purest and most profitable goods to handle.

The Seidlitz Powders manufactured by J. Fred Gibson, Providence, R. I., have always enjoyed a favorable reputation for the excellence of the materials employed, correct weight and the attractive manner in which they are put up. As Mr. Gibson makes a specialty of this particular preparation the trade will not be disappointed in demanding an article of high standard. Write for sample box.

A HAPPY HIT.

Made by the Eastern Star Perfume at a Reception in Iowa.

The Iowa Masonic Library and Museum at Cedar Rapids is well known throughout Europe as well as America, and is the only library building of its kind in the world. It is a magnificent fire-proof structure, and contains the largest collection of Masonic works ever gathered under one roof, beside countless curios, and a fine archaeological collection.

Under the successful management of Mr. Parvin, the grand secretary and librarian, every department of the place is fitted with taste and elegance in all its appointments, combining to make it most attractive and interesting to visitors. At a recent reception given in the library building by Mr. and Mrs. N. R. Parvin, the Jackson perfumes scored a very happy hit, an account of which we copy from the Cedar Rapids Daily Republican:

"The refreshments were very elegant, and the favors which each guest received as the exit was passed are entitled to a description and explanation. Last summer when Mr. Parvin was at the Columbian Exposition gathering specimens from all quarters to be placed on exhibition at the Masonic Library, he met, during his rounds, many Masons. One day he fell in with a party of perfume manufacturers, and one of the number was a royal fellow named Charley Jenks, of the perfumery house of Foote & Jenks, Jackson, Mich. He and Mr. Parvin became well acquainted, and upon the suggestion of the Cedar Rapids Mason, the Jackson Mason decided to give one of his brands of perfumery the name of the "Eastern Star." When Mr. and Mrs. Parvin issued the invitations to their reception, they very naturally sent one to Mr. Jenks. Imagine their surprise yesterday morning when they received from Jackson a large case of "Eastern Star" perfumery, neatly put up in small bottles with gay ribbons around the necks, to be used as souvenirs of the evening. Accompanying these was a handsome silk banner, on which was painted the well-known star, and pinned to it a note which read: "Your guests need but press the bulb, we do the rest." This was meant for the big bottle of "Eastern Star," with the syphon attachment. During the evening Mr. Jenks' perfume was tried, and it can be said with satisfaction to all. Everybody received a bottle of "Eastern Star."

P. S.—Trade tributary to New York City can now be supplied with Foote & Jenks' Perfumes by

McKESSON & ROBBINS.

See list of odors in February 1st issue of the Era, or write the house for their illustrated catalogue and sample of Eastern Star.

A tablet machine is an article which the majority of retail druggists could make frequent use of if they possessed one. Those who desire to own one or are halting between two opinions as to the practicability of purchasing a machine should write to Robt. Shoemaker, Jr., 215 Race street, Philadelphia, for prices and information upon the machines which he manufactures. He makes several sizes for both hand and steam power, which are adapted for both the manufacturer and the retail druggist.

The reason why many retail druggists do not handle Kumyss is because they think it impracticable. This arises from the fact that they have not investigated the matter. Kumyss is now recognized by the medical profession as a valuable remedial agent, and would be prescribed oftener if the physician knew it could be obtained readily. The drug trade can learn all about Keir Kumyss by writing to R. E. Rhode, 504 N. Clark st., Chicago, and will be furnished with facts and figures showing that it is a profitable article to handle.

Silurian Mineral Spring water is put up in several forms to meet the requirements of all classes of patrons. For those who desire a simple medicinal water the "Still Silurian" is recommended, while those who seek a delicious medicinal beverage will find themselves suited with either "Effervescent Silurian," "Silurian Ginger Ale" or "Silurian Wild Cherry Phosphate." Druggists who wish to meet the various demands of their customers should address Silurian Mineral Spring Co., Waukesha, Wis., for prices, terms and 52-page pamphlet.

The great success which has always attended the sale of Santal-Midy capsules can best be explained upon the ground of actual merit. The Oil Santal used in their manufacture is distilled by Midy's process from freshly-cut Mysore sandal wood and is greatly superior to the ordinary commercial oil. The capsules containing 5 minims each of the oil are put up in bottles containing 40 capsules and are sold in the United States by E. Fougere & Co., of New York. The reputation of this preparation makes it a sure seller and the profit in handling it makes it a favorite with the drug trade.

Spokesman of the relief committee—"Now, Mr. Pillsburger, the wealthy merchants are assisting in our work, not only by contributions, but, some of them, by selling the necessities of life, such as tea, bread, coal and wood, at cost. What can you do for us?"

Pillsburger (the druggist)—"You will find me ready to help der unemployed. Put me down as der man vat sells bostage stamps at gost!"—Puck.

C. F. Rump & Sons, of Philadelphia, manufacturers and Importers of pocket-books and fine fancy-leather goods, have found that their rapidly increasing business demanded more space, and have moved into their new building, corner Fifth and Cherry streets. This building has a frontage of 157 feet and comprises seven lofty floors and basement. They occupy the entire building and employ from 300 to 400 hands, and are in a position to take care of all orders with which their patrons may favor them. They have also opened a branch salesroom in the new Cable building, Broadway and Houston street, New York.

A recent advertiser in the "want" columns of the Chicago Tribune shows a versatility both in business attainments and advertising ability, which ought to command a reward. The "ad" reads as follows:

Wanted—Situation by a hankry young man. Will, for a slight consideration and regular meals, give lessons in German or painting; milk, care for horses, give instructions in muddling and drawing, wash or iron, clean windows, take care of children, run errands, do carpenter work, plastering or stone cutting; will run an iron foundry, or a hotel, dry goods or hardware store; keep books, scrub, drive carriage or dump cart; cook or bake, do anything and do it well and take silver in payment for services. Address at once H. H. H. N. B.—Will also do editorial work.

The uniform purity of all the chemicals manufactured by the Herf & Frerichs Chemical Co., of St. Louis, has caused many of the leading physicians and dispensers to specify "H. & F.," and their preparations can be obtained through any of the jobbing houses of the country. A favorite with all druggists is their substitute of bismuth U. S. P., because it is not only free from arsenic, silver, lead, etc., and devoid of acid smell and taste, but is very bulky, without containing a trace of subcarbonate, so that dispensers find it more valuable for many purposes than the heavier kinds often met with in the trade.

The introduction of Upjohn's Friable Pills marked a distinct advance in the pharmacy of this particular method of medication, and the constantly increasing demand for them is evidence of the favor with which they are regarded by the medical profession. More than five hundred different kinds are kept in stock and the list should be in the hands of every druggist who desires to give perfect satisfaction in the goods he handles. The Upjohn Pill and Granule Co., of Kalamazoo, Mich., are the largest exclusive pill manufacturers in the world and their facilities are unexcelled for turning out private formulae under their improved process.

What conclusion have you and your physicians come to regarding the employment of cachets as a means of dispensing powders in a manner which will be agreeable to the patient? If you are still undecided upon the question, the matter can be easily settled by sending to Ward & Co., No. 3 Union Square, New York, for free samples of Chapeaur's cachets and showing them to your physicians. The expense for the cachets is practically nominal, and their utility behind the prescription counter is recognized at once by the pharmacist who is acquainted with the laborious task of filling a prescription which calls for pills.

In making preparations to meet the demand which is sure to arise next summer for disinfectants, the merits of the Buffalo sanitary fluid should not be overlooked. The future of all preparations of this kind depends upon their success in the past, and this point is one which should be recognized by the retailer as well as by the manufacturer. The former should aim to sell the article which is the most effective, and the aim of the latter should be to furnish such products. This particular preparation is a soluble carbolic acid sold upon its merits, and the manufacturers, Schoellkopf, Hartford & MacLagan, Limited, 3 Cedar street, New York, claim for it the position of the ideal disinfectant.

BOOK REVIEWS.

NATIONAL DISPENSATORY.* This is the first of the two popular dispensatories to appear since the revision of the United States Pharmacopoeia. It is a very decided improvement upon the preceding issue, for the number of years which have passed since its immediate predecessor appeared have seen very great progress in pharmaceutical matters and to bring forth the work up to the times a large amount of labor and compilation of published material have been required. That this task has been satisfactorily accomplished even a casual examination of the work affords abundant evidence. Of the original editors and authors but one is now living, but he has had the co-operation of those well qualified to carry out the work after its well conceived plan. Prof. Malsch, recently deceased, had virtually completed his labors in this revision, but what remained has been confided to Prof. Chas. Caspari, of the Maryland College of Pharmacy. There are 1,903 pages found necessary. There is no separation of matter into primary and secondary lists, but a strict alphabetical arrangement of medicinal substances is followed throughout the work. Every page contains evidence of careful revision, and the addition of new material and the statements made are thoroughly in accord with the progress of pharmacy up to the immediate present. The manner of presenting the information under each title has been little changed. There are given first the official name and a list of the pharmacopoeias by which the article is recognized, the common name, and the various synonyms and names in other languages. In the case of chemicals the formula and molecular weight are stated. Then in order are considered the origin, preparation, properties, tests, pharmaceutical uses, medicinal action and value, and under the same division in nearly every instance is given a large amount of collateral information, descriptions of allied bodies and the like, with a comparison of their values and characteristics. Authority to use for comment the new United States Pharmacopoeia has been granted by the committee of revision, and this privilege is liberally and satisfactorily used. A feature which many will regret but many more approve is the plan of giving metric weights and measures in the formulas their equivalents in the apothecaries' system, thereby greatly retarding the general adoption of the official system. The host of new remedies and synthetic

*The National Dispensatory. Containing the natural history, chemistry, pharmacology, actions and uses of medicines, including those recognized in the pharmacopoeias of the United States, Great Britain and Germany, with numerous references to the French Codex. By Alfred Stille, M. D., LL. D., Prof. Emeritus of the theory and practice of medicine and of clinical medicine in the University of Pennsylvania; John M. Malsch, Ph. M., Phar. D., late professor of materia medica and botany in Philadelphia College of Pharmacy, secretary to the American Pharmaceutical Association; Charles Caspari, Jr., Ph. G., professor of pharmacy in the Maryland College of Pharmacy, Baltimore, and Henry C. C. Malsch, Ph. G., Ph. D., New York, editors. Thoroughly revised, according to the new United States Pharmacopoeia with decennial revision, 1894. In one magnificent imperial octavo volume of 1903 pages, with 320 elaborate engravings. Cloth, \$7.25; leather, \$8. With ready reference thumb-letter index, cloth, \$7.75; leather, \$8.50. Philadelphia, Lea Brothers & Co.

products of recent introduction has received abundant consideration. Typographically, the book is a very great credit to the publishers, and in all respects the pharmaceutical profession will accept with eagerness this revision of a work which for so long has been of indispensable value to its possessors. In the appendix are gathered descriptive chapters on reactions and tests, and the tables which form so important a part of the Pharmacopœia. In addition there are numerous tables of service, and particularly acceptable is an alphabetical list of official drugs, showing the preparations of the United States and British Pharmacopœia containing them. The very complete general index is supplemented by an index of therapeutics, which concludes the volume. The foot note gives the prospective purchaser information additional to that in this brief notice.

AGRICULTURAL ANALYSIS.—This work is eminently valuable to the student who desires to familiarize himself with approved methods of agricultural analysis, and it will be of equal service to the analyst in active work in this branch of analysis. Its descriptions of apparatus and methods are concise, yet sufficiently full for all practical purposes, and as a laboratory hand book to be followed by the performance of the experiments and manipulations described it can hardly be improved upon. The first chapter consists of directions and illustrations of the numerous operations used in quantitative analysis, with practical examples for experiment.

Part 2 is divided into two sections, the first containing gravimetric estimations, wherein are described the methods of estimating iron, sulphuric acid, potash, phosphoric acid, carbonic anhydride, calcium. The second section considers volumetric estimations and directions for the preparation of standard solutions, indicators, etc., and their use in estimating the various substances. Part 3 is devoted to the estimation of nitrogen and the same detail characterizing all other portions of the work is followed out. The remaining divisions comprise chapters on samples and sampling, analysis of feeding materials, analysis and valuation of manures, soil analysis, analysis of dairy produce, and water analysis.

The work seems complete in every detail, and we have nothing but praise to offer, with the exception of a criticism upon the bookbinder's part of the work. According to the English custom, the leaves are uncut and untrimmed, which constitutes an annoyance to the average reader and student.

DISEASES OF PERSONALITY.—In 1891 there was noticed in this department the appearance of this work, which is published in pamphlet form, 157 pages, price twenty-five cents, issued by the Open Court Publishing Company, of Chicago. That it has gained very considerable popularity among a certain class of readers and thinkers for whom it was specially prepared, is evidenced by the fact that this later edition has become necessary. Those interested in psychology will be interested in its perusal. If

*Agricultural Analysis, a manual of quantitative analysis for students of agriculture. By Frank T. Addyman, B. Sc., F. I. C., lecturer on agricultural chemistry, University College, Nottingham. Cloth, 290 pages, illustrated. London, New York, Longmans, Green & Co.

preferred, it can be procured in cloth binding for seventy-five cents.

***HOW TO DO BUSINESS.**—Is the title of a work by George N. McLean, devoted to a consideration of the theory of business science. Chapters are devoted to the choice of a business, purchase of stock, marking goods, advertising, selling goods, cash and credit, expenses and accounts, investment of profits, insolvency, vocabulary of business terms, employing clerks, etc., etc. The author states that no attempt has been made to present a formal code of mercantile laws, nor to write a systematic treatise on trade, but the aim has been rather to present practical illustrations and theories and to combine precept with example.

DOLLARS AND SENSE FOR FIFTY CENTS.—Is the title of a "money-making booklet for business men of brains" by that eminent Doctor of Publicity, Nathaniel C. Fowler, Jr. It is full of good advice for advertisers and presents many illustrations, showing how advertisements should be constructed, also several showing how they should not be constructed. It is published by The Trade Co., 299 Devonshire street, Boston.

MAGAZINES.

The following is a brief mention of the important features of the February magazines:

Outing has a table of contents which is decidedly attractive to the lovers of winter sports. It contains "Invisible Chains," by Louise D. Mitchell; "The Home of the Hulero, or Canoeing in Honduras," by E. W. Perry; "The Price of a Name," by E. H. Harrison; "Hunting in Polar Regions," by J. M. Mills, M. D.; "In the Land of Josephine," by W. L. Beasley; "Jamaica for Cyclists," by Alan Eric; "Alaskan Boats," by Lieut. J. C. Cartwell; "A Day's Sport in the Caroline Islands," by S. H. Watts; "A Path Through the Woods," by Jas. Buckham; "In Another World Than Ours," by Grace E. Channing; "Trawling With Gloucester Fishermen," by J. Z. Rogers; "A Sportsman's Taxidermy," by L. H. Smith; "A Championship Hockey Match in Canada," by C. G. Rogers; "The National Guard of Pennsylvania," by Capt. C. A. Booth.

Lippincott's complete novel is entitled "The Picture of Las Cruces," by Christian Reid, and deals with the curious experience of an American artist at the ancient house of a noble Mexican family. Three chapters of Gilbert Parker's story, "The Trespasser," are given in this number. Other articles of interest are: "Dr. Pennington's Country Practice," by Butler Monroe; "Dick," by G. G. Bain; "A House That Jack Built," by P. A. Tucker; "Study of Pawnbrokers," by Champion Bissell; "The Science and Art of Dramatic Expression," by Alice W. Rollins; "Norwegian Hospitality," by Hjalmar Hjorth Boyesen; "Freaks," by Charles Robinson, and "Talks With the Trade: Have Young Writers a Chance?"

The Century appears with the additional title of "Midwinter Number," and its prominent features in the way of fiction will make it more than usually acceptable to the reading public. Mark Twain's story, "Pudd'nhead Wilson," shows several incidents of antebellum days, which partake of the dramatic. Mary Halleck Foote writes of la-

bor troubles in a story called "Coeur d'Alene." "A Romance of the Faith," by Herbert D. Ward, is a piece of fiction whose hero is Abraham, father of the Jews. Other stories are: "The Guests of Mrs. Timms," by Sarah Orne Jewett; "Mr. Ebenezer Bull's Investment," by Richard M. Johnston, and "The Matinee Monotones," by George Wharton Edwards. February being the birth-month of Lincoln and Washington, two hitherto unpublished portraits of the latter are produced, and "Lincoln's Place in History" and "Lincoln's Gettysburg Address" make the number notable in a historical sense.

St. Nicholas contains a sequel to the story of "Mowgli," by Rudyard Kipling, entitled "Tiger! Tiger!"; "Towed by an Iceberg," by J. O. Davidson; "Recollections of a Wild Life," by Dr. Eastman; "A Skater's Strategem," by Kate W. Hamilton; "Benjamin Franklin," by Brander Matthews; "The Quadrupeds and Monkeys of North America," by William T. Hornaday; "Tom Sawyer Abroad," continued, by Mark Twain; "The Dead Letter Office," by Patti Lyle Collins; "Babette," by Mary A. Winston, and "Toinette's Philip," continued, by Mrs. C. V. Jamieson.

A reading of the table of contents of Popular Science gives added significance to the title of the publication. Dr. Andrew D. White contributes the first installment of a series of papers on "New Chapters in the Warfare of Science"; Prof. W. S. Windle furnishes "Notes From a Marine Biological Laboratory"; C. S. Ashley writes of "The Relation of Evolution to Political Economy"; S. J. Hickson, of "Physical Conditions of the Deep Sea"; W. Mills of "Heredity in Relation to Education"; Mrs. E. B. Dietrich of "The Circassian Slave in Turkish Harem"; Jas. E. Humphrey of "Where Bananas Grow"; Miss E. A. Youmans of "Tyndall and His American Visit"; Jas. Monteiuh of "The Psychology of a Dog"; Miss E. L. Macdonell of "The Superstitions of French Canadians"; M. H. Coupin of "The Wandering Jew at the Salpêtrière"; Prof. J. H. Gore of "The Shape of the Earth from a Pendulum"; Joseph Prestwich of "The Position of Geology," and Prof. M. E. Anderson gives a "Sketch of David Jordan."

The North American Review is strictly up to date and is replete with discussions of the important questions of the day. The new president of the Swiss republic writes of "My American Experiences"; Gov. Tillman writes of "The South Carolina Liquor Law"; Sir John Lubbock of "The Income Tax in England"; Senator Roger Q. Mills of "The Wilson Bill"; Rev. Dr. Parkhurst and John W. Goff write of municipal reforms which are needed in New York city; the Right Rev. Monsignor Bernard O'Reilly writes on "Territorial Sovereignty and the Papacy"; Brazilian Minister Mendonca on "Latest Aspects of the Brazilian Rebellion." The workings of the customs administration act under the old and the proposed new law are discussed by the assistant secretary of the treasury, Chas. S. Hamlin; Margaret Deland writes of "A Menace to Literature," and Dr. Cyrus Edson discusses the "Evils of Early Marriages;" the question, "Are We a Plutocracy?" is not definitely answered by William Dean Howells, but his treatment of it is almost equal to an affirmative. The greatest question of the day, "How to Help the Unemployed," is answered by Henry

*How to do Business.—By George N. McLean, cloth, 377 pages, price \$2. Chicago: Jefferson Jackson, 45 Dearborn street.

George by calling attention to the views of the new school of political economy, of which he is the acknowledged leader.

The Atlantic is fully up to its high standard of literary excellence, as is indicated by the table of contents, which shows "The Educational Law of Reading and Writing," by Horace E. Scudder; "Tammany Hall," by Henry C. Merwin; "Francis Parkman," by Oliver Wendell Holmes; "Hamilton Fish," by J. C. Bancroft Davis; "Recollections of Stanton Under Lincoln," by H. L. Dawes; "For Falstaff He is Dead," by Grace McGowan Cooke; "From Literature to Music," by R. J. Lang; "In a Pasture by the Great Salt Lake," by Olive Thorne Miller; "Tao," by William Davies; "Two Strings to His Bow," by Walter Mitchell; and installments of the two serials, "Philip and His Wife," by Margaret Dohand, and "His Vanished Star," by Chas. Egbert Trudbeck.

The Midwinter Ladies' Home Journal contains an article on the methods of an actress by Adelaide Hilstori; "The Aberdeen Waltzes," by Mrs. Francis J. Moore; "A Valentine Dinner," by Mrs. Burton Kingsland; "My Tabooed Playmate, Adeline Patti," by Katherine B. Foot; and installments of the series of papers on "How Fauntleroy Really Occurred," by Mrs. Burnett; "Pomona," by Steckton; "Literary Passions," by Howells, and the "Brownies," by Palmer Cox. Mrs. Elizabeth Robinson Scovill has a very timely article on "Care in Infectious Diseases."

There is some little discussion going on in pharmaceutical circles regarding the correctness of color vision on the part of pharmacists, and the desirability of instituting tests which will determine the ability of those who practice the profession to distinguish one color from another. While the question may not possess sufficient significance to bring it under legal notice, as is the case with enactments which require perfect color sense on the part of those engaged in land and water transportation, military service, etc., yet it is one which may concern the safety of the public in more ways than one. Perhaps one of the most important steps in chemical work is the application of tests and the identification of results, and one cannot help noting, in glancing over any work devoted to this subject, the great dependence which is placed upon color reactions. The identification of the primary colors and their combinations and variations requires the keenest sense of discrimination, and chemical testing affords an instance where this sense is required in its greatest perfection. It is not believed that the percentage of people afflicted with color blindness is very great, and it is an undecided question whether this defect is always congenital or may come into existence gradually. It is also quite improbable that anyone desiring to enter the drug business could make much progress without visual errors of this kind being detected. If it is possible that such a defect is one which may be acquired gradually, the danger which menaces the public by reason of the errors which might be made by the dispenser who relies upon the color of a drug nearly as much as he does upon the label, is one which possibly calls for the institution of restrictive measures. However, with our present data the matter is one of a speculative nature, and its importance can only be determined after considerable investigation.

PLAYING CARDS.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to F. S. Eastis, Gen'l Pass. Agt., C. B. & Q. R. Co., Chicago, Ill.

DISTEMPER CURE.

Spencer, Toxica Co., N. Y.

Dear Sir: In answer to yours would say that I have sold your "Liquid Heave Cure" for several years. It has given general satisfaction. In fact it has become a necessity with our liverymen and all others who have used it.

Yours truly,

C. J. FISHER, Druggist.

THE WORLD'S FAIR FOR SALE.

LOOK AT IT! The Michigan Central has arranged with one of the best publishing houses in the United States for a beautifully printed series of World's Fair pictures, to be known as the Michigan Central Portfolio of Photographs of the World's Fair.

The original photographs would cost not less than a dollar apiece, but the Michigan Central enables you to get 16 pictures for 10 cents.

It's the finest. It's the most complete.

It's the best. It cannot be beaten.

If you saw the World's Fair, you want it as a perpetual souvenir of a memorable visit.

If you didn't get there you want this to see what you missed, and to fill your mind with the beauty and glory of the White City.

Call on the nearest Michigan Central ticket agent, and he will furnish you with the first part and tell you more about it, or write to O. W. Ruggles, G. P. & T. A., Chicago, enclosing 10 cts. for the collection.

Dr. Earl S. Sloan Co., Boston, succeeds Dr. Earl S. Sloan in the manufacture of proprietary medicines.

The Lila Flower Co., Bangor, Me., is a new firm formed for the manufacture of proprietary medicines.

"Yes," said the boy, as his mother took a bigger pull than usual at the whiskey bottle, "Mumm's Extra Dry!"—Life.

R. Hillier's Sons Co., New York, will move to 35 William street on or about May 1.

A man called at a drug store the other day and asked for a particular kind of soap.

"Scented or unscented?" asked the drug clerk.

"I'll take it wld me," said the man.

PENCILS FOR CHILBLAIN AND CHAPPED HANDS.—Melt thirty parts paraffine, gradually add thirty parts paraffine oil, allow the mixture to partially cool, dissolve in it one part iodine, stir in two parts tannin, and, lastly, add three parts alcohol, and when sufficiently cool, pour into moulds.

THE MARKETS.

The fluctuations noted in this market report are those affecting goods in original packages and jobbing lots. A complete price list, showing quotations as made by jobbers to retailers, will be found upon another page under the head of "Prices Current."

ADVANCED.—Opium, morphine, quinine, cocaine, Mexican sarsaparilla, nitrate of soda, chloral hydrate, gambler, German quinine seed, cubeba, Malaga olive oil, linseed oil.

DECLINED.—Wood alcohol, citric acid, boric acid, broken cuttle bone, nitrate of silver, mercurials, cream tartar, thymol.

New York, February 10, 1894.

There has been a further increase in the general volume of business during the past two weeks, and the improved demand, together with other influences, has stimulated a hardening tendency to values of a large number of articles. In fact the market may be characterized as fairly buoyant, and while the movement is almost exclusively confined to moderate quantities, dealers are apparently well content with the general condition of affairs. The absence of speculative interest is considered favorable, and with the law of supply and demand as the principal factor in governing fluctuations, there is nothing in the future outlook to occasion anxiety on the part of consumers. There is still a disposition to keep within the requirements of the present, or at least not to purchase far in excess of near-by necessities, consequently individual transactions of magnitude are exceptional. The cautious policy of buyers, however, can hardly be objectionable, but in view of the general upward tendency of the market, it behooves those interested to carefully consider future probabilities. The action of the appraisers' department regarding recent importations of asafoetida has practically prevented dealers from replenishing their stocks, and it is generally believed that supplies will soon be exhausted. During the past few days the same department is said to have rendered unfair decisions regarding Ipecacuanha, and it is proposed to have the action of the appraiser discussed at the next regular meeting of the Drug Section of the Board of Trade.

OPIMUM.—There has been a decided change in this product since our last report. The market has been active, excited and higher. Sales are reported of fully 20 cases, mainly for manufacturing purposes, and values have been advanced to \$3 and \$3.25. Should the proposed new tariff bill become a law the duty of \$1 per pound will undoubtedly be one of the features.

POWDERED OPIMUM.—Has advanced in proportion to the improvement in the gum, values are stronger and the range is \$3.50 to \$3.75 as to test and quantity.

QUININE.—Has been moving freely into channels of consumption, and an unusually large volume of business has been transacted, but during the past few days the demand has fallen off somewhat and a comparatively quiet feeling has prevailed. The lull in trade is only natural, as a general advance in values was anticipated and buyers were anxious to secure supplies previous to its occurrence. As a result they have fairly liberal stocks on hand, and are not disposed to increase their holdings. The anticipated advance

was made on the 1st inst. when foreign manufacturers notified their agents here to mark up prices $\frac{1}{2}$ cents per ounce, making the bulk value 25 cents. American makers on the same date advanced their quotations to the basis of $\frac{2}{3}$ cents for bulk. The tone of the market continues strong and it is believed that a further enhancement of values is contemplated.

CINCHONIDIA—Is stronger in sympathy with quinine and increased activity is noted in the demand.

MORPHINE—The upward movement in opium has influenced an advance of 15 cents per ounce on the part of the leading manufacturers, but the market has an unsettled appearance and some holders are disposed to grant concessions.

GRAIN ALCOHOL—Is unchanged in price and a fair business is reported at the old range of \$2.24 to \$2.28, according to quantity.

WOOD ALCOHOL—Is lower owing to keen competition between the combination and outside producers, and a general decline of 10 cents per gallon is noted on all grades. The demand for high test continues to improve.

ERGOT—Is firmer, particularly the better qualities, which are in better demand from the consuming trade, and stocks are steadily shrinking. Foreign markets are also reported stronger.

COCAINE—There have been two advances by manufacturers since our last report and current quotations are based on \$5.90 for eights.

CACAO BUTTER—Supplies continue light and the stock of 12-pound boxes is steadily being reduced. As a consequence values show a hardening tendency, but former quotations will still be accepted for limited quantities.

BLEACHING POWDER—Is in moderate request for consumption, and the better descriptions command full previous prices.

OXALIC ACID—Is ruling steady in price and the movement in a jobbing way is satisfactory to dealers.

CHLORATE OF POTASH—Is slightly unsettled owing to pressure to realize on the part of sellers, and fractional concessions are obtainable on fair-sized parcels.

ARSENIC—A stronger market is noted for both white and Saxony red, and the advance is $\frac{1}{4}$ cent on the former and $\frac{1}{2}$ on the latter. Holders of red are limiting their sales not to exceed 10-keg parcels.

MEXICAN SARSAPARILLA—Is firmer with stocks, closely concentrated and values are about $\frac{1}{2}$ cent per pound higher.

QUICKSILVER—Continues in fair consuming request with prices steady at all distributing points.

CREAM OF TARTAR—Remains quiet under a light current demand, and manufacturers adhere to old quotations.

TARTARIC ACID—Is unsettled and slightly easier owing to efforts to close out the stock of a manufacturer who recently failed.

CASTOR OIL—Jobbing orders are absorbing a fair amount of stock, but the market is without new feature and former prices are still current.

MANNA—All varieties are without important change in quotations and business is limited to small jobbing transactions.

COD LIVER OIL—Is unusually active, and business in the aggregate reaches liberal proportions, with sellers firm in their views regarding values.

BALSAMS—Are all ruling steady under a good consuming demand, but no new features have developed, and values show no change of consequence.

CAMPHOR—Manufacturers adhere to old quotations and report business of average volume.

ESSENTIAL OILS—Leading descriptions continue to move freely in small parcels, the undertone of the general market is fairly steady, and there are no new features calling for special mention.

RHUBARB—All varieties of whole root and cuts are in active request with values showing increasing firmness.

NITRATE OF SODA—Is firmer with values about $\frac{1}{4}$ cents per pound higher.

TONKA BEANS—Continue firm with holders of strictly prime Angostura indifferent sellers.

VANILLA BEANS—All grades are receiving a fair degree of jobbing attention, and the values realized are satisfactory to dealers.

CHLORAL HYDRATE—Has been advanced 15 cents per pound.

GAMBIER—Is higher, and the market has a decidedly firm tone.

CITRIC ACID—Has been reduced 1 cent per pound by manufacturers, and foreign shows a corresponding decline.

BENZOIC ACID—German is stronger under reduced supplies, and a fair inquiry from consumers.

QUINCE SEED—German is very scarce, and holders have advanced prices about 5 cents per pound.

CHICLE—Is obtainable at former figures, but the market is unsettled and irregular, with dealers apparently uncertain regarding the future outlook.

CUTTLE FISH BONE—Has been moving rather more freely with values steady for all varieties except broken, which is about 1 cent per pound lower.

MENTHOL—Continues scarce and wanted, with holders of the exceedingly limited stock exacting extreme prices.

NITRATE OF SILVER—Manufacturers have made a reduction of $\frac{1}{2}$ cents per ounce in their quotations.

Product of Smoke.—Andrew J. Chase, Boston, Mass.

511,303—Piperazin.—Wilhelm Majert, Gruenau, and Albrecht Schmidt, Berlin, assignors to the Chemische Fabrik auf Actien (vormals E. Schering, Berlin, Germany).

511,330—Process of and Apparatus for Manufacturing Ozone Gas.—Ernst Fabrig, Marseilles, Ill.

511,333—Process of Making Caramel From Distillery Refuse.—Jullus Mosler, Rixdorf, Germany.

511,150—Process for the Manufacture of Paramidophenol Sulphonic Acid.—Arthur A. Noyes and Arthur A. Clement, Boston, Mass.

511,653—Blue Dye.—Gustav Schultz, Berlin, Germany, assignor to the Actien-Gesellschaft fur Anilin Fabrikation, same place.

511,628—Blue-Black Azo Dye.—Theodore Diehl and Max Moeller, Berlin, Germany, assignors to the Actien-Gesellschaft fur Anilin Fabrikation, same place.

511,708—Production of Amido-Naphthol Disulfonic Acid. Max Moeller, Berlin, Germany, assignor to the Actien-Gesellschaft fur Anilin Fabrikation, same place.

511,755—Triturating and Emulsifying Machine.—William E. Cowen, Guelph, Canada.

511,782—Disinfectant.—Charles D. Lippincott, Denver, Col.

511,898—Naphthol Trisulfonic-Acid Monamid.—Hans Kusel, Hochst-on-the-Main, Germany, assignor to the Farberwerke, vormals Meister, Lucius & Brunig, same place.

511,901—Tetraamitro Anthrachryson.—Heinrich Laubmann, Hochst-on-the-Main, German, assignor to the Farberwerke, vormals Meister, Lucius & Brunig, same place.

511,903—Apparatus for and Process of Making Carbonated Beverages.—John Macksey and William Helmer, Boston, Mass., assignors to the American Soda Fountain Company, same place.

512,065—Box for Tooth Powder.—Warren A. Spalding, New Haven, Ct.

512,070—Apparatus for Charging Liquids With Carbonic Acid.—Jacob F. Theurer, Milwaukee, Wis., assignor to the Universal Carbonating Company, New Jersey.

512,116—Crimson Azo Dye.—Richard Kirchhoff, Berlin, Germany, assignor to the Actien-Gesellschaft fur Anilin Fabrikation, same place.

512,167—Blue-Black Dye.—Theodore Diehl, Berlin, Germany, assignor to the Actien-Gesellschaft fur Anilin Fabrikation, same place.

512,493—Blue Dye.—Moritz Ulrich and Johann Bammann, Elberfeld, Germany, assignors to the Farbenfabriken, vormals Fr. Bayer & Co., same place.

512,590—Orthooxyethyl-Alpha Benzoylamido-Quinolone.—Gerhard Nicolaus Vis, Barmen, Germany, assignor to Dahl & Co., same place.

512,705—Stopper for Bottles, Jars, etc.—Philip H. Holmes, Gardner, Me.

512,801—Process of Manufacturing Aluminium.—Willard E. Case, Auburn, N. Y.

512,802—Process of Manufacturing Aluminium.—Willard E. Case, Auburn, N. Y.

512,803—Process of Making Aluminium Compounds.—Willard E. Case, Auburn, N. Y.

512,812—Bottle Protector.

512,874—Vessel for collecting Precipitates.—Horatio N. Fraser, New York, N. Y.

PATENTS,

510,834—Process of and Apparatus for Dissociating Soluble Salts by Electrolysis.—Henry S. Blackmore, Mount Vernon, N. Y.

510,886—Bottle-Washer.—Frederic G. Littlell, Brooklyn, N. Y.

511,130—Bottle Packing Device.—William Eggers, Alleghany, and Sebastian Mueller, Sharpsburg, Pa.

511,143—Process of Making Sodium Acetate.—William H. Higgin, Bolton, England.

511,288—Apparatus for Producing a Liquid

- 512,983—Apparatus for Dispensing Soda Water.—Adam O'Hara, Chicago, Ill.
- 513,001—Process of making Alkali Salts.—Henry S. Ilackmore, Mount Vernon, N. Y.
- 513,127—Cream-Cooler and Soda Fountain.—Frank W. Merrill, Deering, Me.
- 513,130—Apparatus for the Production of White Lead.—Norman K. Morris and John W. Bailey, Denver, Col.
- 513,153—Inhaler.—William B. Spencer, Chicago, Ill., assignor of one-half to T. W. Knill, same place.
- 513,204—Process of Making Pure Sulfitic Compounds.—Ernst W. R. Schroter, Hamburg, Germany, assignor to Ichthyol Gesellschaft, Cordes, Hermann and Co., same place.
- TRADE MARKS.**
- 23,923—Ointment for Skin Diseases.—The word "Incoline."
- 23,924—Medicinal Mixture for Certain Named Diseases.—Jean Rein Blumenberg, St. Louis, Mo. The word "Heroutine."
- 23,927—Remedies for Diarrhoea and Gouty Rheumatism.—Chemische Fabrik, vormals Hofmann & Schoetensack, Ludwigshafen-on-the-Rhine, Germany. The word "Salacelot."
- 23,928—Remedy for Rheumatism.—Joseph P. Greene, San Antonio, Tex. The compound word "Pao-Lao."
- 23,929—Remedies for Diseases of the Stomach, Spleen, Liver, Lungs, Heart, Spine and Nerves.—Khuised Manekji Tata, Navsari, near Bombay, India.—A tropical scene and the representation of a woman in a classical or Oriental costume, with the right arm outstretched and bearing a bottle in the left hand.
- 23,930—Hougies and Suppositories.—Frederick Wuersten, New York, N. Y. The word "Cicelol."
- 23,931—Remedies for Piles.—Hamilton & Whittin, Chicago, Ill. The word "Pileine."
- 23,932—Medicinal Tablets.—Fernie Tablet Co., St. Louis, Mo. The word "Fernine."
- 23,933—Medicine for the Cure of Liver and Kidney Diseases.—Peter P. Bradt, Worcester, Mass. The words "Blood Wine."
- 23,940—Olive Oil.—Frederic Reiset and Gustavus Waeber, New York, N. Y. The letters "J" and "M."
- 23,946—Water Filters.—John C. Wands, St. Louis, Mo. The words "Water Polisher."
- 23,950—Pills.—Frank J. Cheney, Toledo, Ohio. The words "Hall's Family Pills."
- 23,951—Purgative Tea.—Auguste Slerc, Paris, France. The representation of a rectangular label bearing the figure of a centaur and crossed by a band bearing the words: "Bande de Garantie."
- 23,971—Prepared Foods for Children and Invalids.—The Imperial Granum Company, New Haven, Conn. The representation of an imperial crmine bearing a shield of the stripes and stars partially inclosed by a wreath above which is a half moon, the whole being mounted by a crown.
- 23,977—Perfumed Toilet Preparations.—Lecaron et Fils, Paris, France. The fac simile signature "Gelle Freres."
- 23,978—Chewing Gum.—William R. Betham, Chicago, Ill. The word "Celerene."
- 23,979—Hair Tonic.—Leon Pierre Federmeier, Chicago, Ill. The words "Anti Dandruff Hair Tonic" inclosed with a canopy of drawn curtains.
- 23,980—Borax.—Frank M. Smith, San Francisco, Cal. The representation of a desert scene and a wagon train crossing the same.
- 23,982—Antidotes for Uric Acid Diathesis.—Arthur Stern, New York, N. Y. The word "Uricine."
- 23,982—Medical Compound for Use as a Tonic.—The Tilden Company, New Lebanon, N. Y. The words "Tilden's Beef, Iron and Rye."
- 23,983—Remedies for Constipation and Diseases of the Liver and Kidneys.—The E. A. Butts Company, Washington, D. C., New York, N. Y., and Chicago, Ill. The representation of two roosters and a stone.
- 23,984—Line of Proprietary Medicines.—Alexander P. Sawhill, Allegheny, Pa. The portrait and fac simile signature of Father S. G. Mollinger.
- 23,985—Anodyne and Antipyretics.—Phena Tro Cine Chemical Company, Philadelphia, Pa. The words "Phena Tro Cine."
- 23,986—Blood Purifying Tea, Lintment, Salve and Cough Syrup.—Hermann B. Hackendahl, Milwaukee, Wis. A portrait of the Rev. H. Jansen dressed as a priest.
- 23,987—Bronchial Waters, Troches and Lozenges.—The Stone Medicine Company, Chicago, Ill. A monogram of the letters "X" and "S."
- 23,988—Blood, Liver, Kidney and Stomach Medicine.—Frank A. Stutz, Bucyrus, Ohio. The words, "Dr. White's New Remedy."
- 23,989—Remedy for the Headache.—Notley Claude Young, San Antonio, Tex. The representation of a woman's head and the word "Headicine."
- 23,992—Prepared Meat Juices and Iron.—Frederick Stearns & Co., Detroit, Mich. The word "Hæmoferrum."
- 23,997—Remedies for Rheumatism, Neuralgia and Lumbago.—Sophie Klein, New York, N. Y. The representation of an eagle perched upon a book, sprays of vines surrounding the same, and the abbreviations and words: "Mrs. Ph. Klein's Herb Balsam."
- 23,998—Remedies for Dyspepsia, Indigestion and Diphtheria.—Robert W. Johnson, New Brunswick, N. J., and New York, N. Y. The word "Carapin."
- 23,999—Remedies for Dyspepsia, Indigestion and Diphtheria.—Robert W. Johnson, New Brunswick, N. J., and New York, N. Y. The word "Pinapsin."
- 24,009—Toilet Soap.—Jarmuth Brothers, Chicago, Ill. The word "Jersey Cream."
- 24,011—Disinfectants.—Miller Brothers, New York, N. Y. The word "Microzone."
- 24,012—Remedies for Rheumatism and Similar Complaints.—John Levy, Philadelphia, Pa. The word "Inkerlas."
- 24,013—Remedies for Throat Diseases.—Apoth. Strehler & Co., Munich, Germany. The representation of a heart within a star and the words "Succus" and "Antidiphtherilin."
- 24,014—Cod Liver Oil.—C. C. Kraemer Company, Brooklyn, N. Y. The word "Ironized."
- 24,015—Preparation of Oils for Chronic, Malignant and Lung Diseases.—Drs. Reynolds & Reynolds, San Antonio and Dallas, Tex. The words "Oil Cure" and the representations of three men arranged in triangular form.
- 24,016—Remedies for Malarial Diseases.—Paris Medicine Company, Paris, Tenn.
- The words "Fibriline or Tasteless Syrup of Quinine."
- 24,017—Certain Named Medical Compounds.—Samuel Morris, Cardiff, England. The word "Dilgent."
- 24,018—Tonic.—Charles F. J. Pettit Do Langle, Lynn and Boston, Mass. The words "Parialino Aphro Tonic" and the representation of a man kneeling before a woman.
- 24,017—Medicinal Plasters.—William H. Gannett, Augusta, Me. The representation of the symbolical figure of a giant holding aloft in his hands a globe on which is represented a plaster.
- 24,018—Acetic Acid.—Couts & Sons, Toronto, Canada. The word "Acetoura."
- 24,019—Preparation of Magnesia.—The Charles H. Phillips Chemical Company, New York, N. Y. The words "Milk of Magnesia."
- 24,020—Antidotes for Poison or Snake Bites.—Levi S. B. Slusser, Mt. Olive, Cal. The representation of an Indian woman in a field of snake wood, in the act of plucking stems, and having a pack on her back supported by a band passing around her forehead.
- 24,021—Refined Petroleum for Internal and External Remedies for Disease.—Angier Chemical Company, Boston, Mass. The representation of a Greek cross inclosed by two concentric circles.
- 24,022—Remedy for Diseases of the Blood.—Lewis J. Bell, Pike, Ind. The letters "C. U. C."
- 24,023—Remedy for Diseases of the Blood and Nervous System.—Samuel A. Richmond, Tuscola, Ill. The word "Epileptine."
- 24,024—Tonic, Blood Purifier and Fever Preventive.—Harvey & Co., Fort Huron, Mich. The words "Harvey's Dandelion Compound" on a black ground on which also appears a light scroll-like panel bearing the pictorial representation of a dandelion in flower and the words "Dandelion Compound," the latter words being in red.
- 24,025—Remedy for Rheumatism.—Frank Sherman, Shenandoah, Iowa. The representation of a rampant lion resting his fore paws upon a standing bottle.
- 24,028—Root Beer.—The Charles E. Hires Company, Philadelphia, Pa. The words "Hires' Root Beer."
- 24,026—Chewing Gum.—J. Hungerford Smith Company, Rochester, N. Y. The words "True Fruit."
- 24,027—Toilet Powder.—Ernest D. Miltner, Savannah, Ga. The words "Infants' Friend."
- 24,029—Ink, Mucilage and Sealing Wax.—Pomeroy Bros., Newark, N. J. The representation of a lion rampant holding an apple.
- 24,032—Extract of Sarsaparilla.—Henry W. Tate, Fremont, Nebr. The representation of an anchor and the words "Hope for All," arranged with the word "Hope" on the anchor and the words "For All" on either side thereof.
- 24,033—Medicinal Agents for Use in Nervous Diseases as a Febrifuge and Soporific.—The firm of E. Merck, Darmstadt, Germany. The word "Thermodin."
- 24,034—Medicinal Agents for Use in Urinary Diseases.—The firm of E. Merck, Darmstadt, Germany. The word "Uroperlin."
- 24,035—Remedy for Coughs, Colds and all Diseases of the Throat and Lungs.—Percy G. McComas, Washington, D. C. The word "Emulsolatum."

FREDERICK BELDING POWER.

PROFESSOR POWER is now in the forty-first year of his age. An American by birth and parentage, almost a German by study and assimilation, he has devoted himself to pharmacy since the age of 14. After that early age, for the first nine or ten years he worked in dispensing pharmacy: five years in his native town of Hudson, N. Y., then for a year in Chicago, and then nearly four years in Philadelphia and its vicinity, including a year and a half as assistant in the pharmacy of Professor Edward Parrish, of honored memory. His preparatory schooling was taken in Hudson Academy, mainly before he entered the drug store. While employed in Philadelphia he attended the Philadelphia College of Pharmacy and graduated therefrom in 1874. Two years after he went to Europe, studied over four years in German universities, chiefly the University of Strassburg, in which he received the degree of Doctor of Philosophy in 1880. At Strassburg he took a wide range of scientific studies, mostly by laboratory methods, working his theses under Professor Flueckiger, to whom he was assistant for a year. Flueckiger and Hanbury's Pharmacographia had appeared in England a year or two before Mr. Power took up his residence in Strassburg. After graduation, and after

visiting the resources of education in several countries, Dr. Power returned to the United States, and, for a time, took charge of analytical chemistry in the Philadelphia College of Pharmacy. About this time he joined Dr. F. Hoffmann, of New York in re-writing and extending the well-known work "Examination of Medicinal Chemicals." In 1883 Dr. Power was called to take charge of the School of Pharmacy of Wisconsin University, then being established at Madison, Wis. To this work, as professor of pharmacy and of materia medica, with much labor in the organization of the School, he devoted himself for nine years. In Wisconsin University he has left warm friends, and a record of sterling service. A year after his resignation at Madison he was invited to come back and give the commencement address in the School of Pharmacy there. In that address he sets forth in vigorous terms "The Mission of Pharmaceutical Schools" in the United States (Phar. Rund., II, 28). Pointing to the example of the School of Pharmacy of the University of Michigan, he made an unanswerable plea for laboratory methods, with full college years, and the student's entire time in the college work. The address was so far appreciated by Wisconsin University that it was printed in its An-

nouncement of the School of Pharmacy for the following year. In 1882 Professor Power left Madison to become director of the manufacturing laboratories of Messrs. Fritzsche Brothers, of New York (Schimmel & Co., Leipzig), where he is still engaged. In the several branches of pharmaceutical service and study, to which Professor Power has devoted himself, he has aimed at the best, sparing no industry, and has achieved excellence. His example is conspicuous among many proofs that there is, in the hearts of young drug clerks of the United States, an undaunted determination to have that knowledge which is real success in pharmacy. Professor Power's published contributions, book translations, researches, etc., appear in the literature of every year since 1874. A full index of them all is given in Beber's Gallerie hervorragender Therapeutiker und Pharmakognosten, Geneva, 1893. It should by no means be omitted that Professor Power was a member of the Committee of Revision of the U. S. Pharmacopoeia of 1880, in which he revised the text for volatile oils. He is a member of the German Chemical Society, and a fellow of the American Association for Advancement of Science.

EDITORIAL.

AMERICAN AND ENGLISH PHARMACY.

There are two contributions in this issue to the controversy occasioned by the publication of Mr. Martin's paper on American pharmacy. One is from the dean of a college of pharmacy, extracts from whose announcement were made for purposes of criticism by Mr. Martin. The writer is entitled to an opportunity to refute conclusions he believes incorrect, though the discussion comes very close to being of a personal nature. The writer of the other contribution, printed as correspondence, succinctly describes the apprenticeship system in force in England.

DISPENSING ANTISEPTIC TABLETS.

A number of years ago there were introduced various so-called, antiseptic tablets for the preparation of lotions for the throat and nasal cavity. They met with considerable favor and became popular with the general public. They were efficient for the purposes intended, and being composed of comparatively harmless substances, their misapplication was hardly of serious import. But the recent introduction of antiseptic tablets for the convenience of the surgeon in making antiseptic solutions, may lead to fatal accidents should they be used as were the early forms of antiseptic tablets. It is the duty of the pharmacist in dispensing antiseptic tablets to ascertain the purpose for which they are to be used, and care should be exercised by the physician in prescribing, that the druggist may know just what tablet is desired. Attention to this matter may be the means of averting serious consequences, and, at the same time, save the reputation of both the physician and druggist. Remember, many of the antiseptic tablets contain corrosive sublimate (with or without an acid), and are dangerous when used in concentrated solutions.

DRUG STORE MANAGEMENT.

From the fact that few believe that the stage of perfection has been reached, the question of profitable and satisfactory drug store management is one which will probably always be of much interest to all engaged in the trade. For this reason it is believed that occasional reviews of recent progress, and the publication of suggestions tending to improvement over conventional methods of doing business will be of service, and be received with a due amount of appreciation. It is believed that an inquiry of this sort can be given greater prestige if it is instituted in a formal way and interest concentrated upon it for a certain length of time. With this object in view it is the intention to devote a definite amount of space each issue to the business aspects of pharmacy

treating the different phases of the business in their natural sequence as far as possible. In this issue will be found articles dealing with some of the first steps, including the location and purchase of a stock and the pointing out of the evils which attend the purchase of goods upon the installment plan. As circumstances alter cases it is perhaps impossible to discuss such subjects in an authoritative manner, yet the enunciation of fundamental principles is often productive of much good, and we ask the hearty cooperation of our readers, who are now hiding bright lights under bushels, in making this inquiry a profitable one.

PATENT MEDICINES AND LEGISLATION.

The bill referred to in our Boston newsletter is of a nature calculated to rouse opposition from patent medicine men, who always seem to consider any attempt at the regulation of the sale of secret preparations an impertinent interference with their personal and business rights. This bill aims to protect the public against injurious and dangerous remedies. Surely such aim is one of the high duties of legislation, and it is high time our lawmakers awoke to their responsibilities in this regard. The patent medicine men may object to the methods of ascertaining whether their preparations be dangerous, but they have no right to object to the principle that the people should be protected against possible injury and fraud. The manufacturer of a good article would find in the proposed regulations the best kind of protection. The formula he submits is not to be disclosed, unless found false; and he thus finds irresponsible and fraudulent competition removed. If his goods are not true to pretensions the public are entitled to the knowledge. If the patent medicine is a fraud it should be exposed. The secrecy of the proprietary medicine is one of its chief values and so long as this secrecy is maintained (as this bill provides for all reputable preparations) the sensibilities of the proprietor should be satisfied. It would be in line with nineteenth century advancement for the proprietors of these goods to encourage all efforts on the part of legislative bodies to enact such laws as will tend to elevate the business and purify the catalogue of patent medicines of its many useless and often harmful preparations.

INTERCHANGE OF CERTIFICATES.

It has been some time since we expressed at any length our opinions on this subject, and it would seem that there should be but one opinion regarding it, but the question hobs up serenely so frequently that it is evident there are nearly as many views and beliefs as there are minds considering it.

Ideally, interchange of certificates of registration between boards of pharmacy is all right, for if a man is a competent pharmacist in one state he is equally competent in another. But, practically, interstate registration under existing conditions is bad, because of lack of uniformity in the requirements insisted upon by the boards and the wide variation of standard of fitness applied by them. This is the whole thing in a nutshell. One board may certify that a candidate is a competent pharmacist while another may find him woefully deficient. Or the converse may be true, the rejected of

one board become the accepted of another. Such cases are continually coming to notice, and until there be uniformity of standard, there is no justice in the custom of interstate registration. Such interchange is now accorded by several boards, as a matter of courtesy, but we sincerely believe this courtesy is an unwise policy, a practice wrong in theory and in application. And it will always be wrong until the requirements of all boards of pharmacy are on the same plane; then a man certified as qualified in one state will and should have the right to demand registration without examination in any other state.

Pertinent to this discussion must be considered the acceptance of college diplomas in lieu of examination by the board. Diplomas should not be recognized, for even greater differences exist between colleges than between boards. When the colleges impart the same quantity and quality of instruction, and the boards require the same proficiency, then should it be decided whether to recognize the diploma and to grant certificates of registration good in any state. But to bring about the desired result, the college curriculum must be of a nature to insure the true pharmaceutical fitness of the graduate, and the board standard must be of equally high nature. As a rule, the ones who are now clamoring for interstate registration and diploma recognition are those who have most reason to fear an examination. The man who knows is not afraid or unwilling to demonstrate that he is qualified.

FAULTY TEACHING.

A member of the faculty of a southern school of pharmacy, in a recent lecture on the subject "Incompatibility," made some rather astonishing statements. He said that calomel was incompatible with hydrochloric acid, for "the acid nearly always containing free chlorine, the mercurous chloride takes up another atom of chlorine from the acid, and is converted into mercuric chloride or corrosive sublimate."

Regarding the incompatibility between iodides and spirit of nitrous ether, he says: "The discoloration which is produced is due to free iodine, resulting from the decomposition of the potassium iodide by acetic acid contained in the nitrous ether as a product of its decomposition under the influence of light and air."

Is it any wonder that some college graduates do not acquit themselves with credit at board of pharmacy examinations? A little correction of the above statements seems necessary.

Ordinarily, calomel shows no change when suspended in hydrochloric acid, weak or strong, but if such a mixture be heated or allowed to stand a considerable period, decomposition takes place. This change consists of a darkening of the calomel, evidence of reduction of the mercury in part to free or metallic mercury, and an oxidation in part to mercuric chloride. This change may be effected by boiling in simple aqueous mixture, free acid not being necessary. The statement that it is due to free chlorine in the hydrochloric acid is absurd, a good quality of acid contains no free chlorine. One method of manufacture of calomel consists in precipitation of a solution of a mercurous salt by hydrochloric acid (cold); in fact the insolubility of

mercurous chloride constitutes a principal analytical test for mercurous mercury.

The second statement is equally misleading. The decomposition of potassium iodide by spirit of nitrous ether is but a common illustration of the incompatibility of iodides and nitrates. This oxidation and reduction change, whereby the iodide is changed to free iodine and the nitrite to N O (or other nitrogen oxide) is relied upon for quantitative test for the estimation of the quantity of nitrous ether (ethyl nitrite), in one of the methods described in the pharmacopœia. The change is facilitated by the presence of free acid (acetic, perhaps), but is not dependent upon or occasioned by it.

A certain professor in an eastern college of pharmacy used to tell his students that bicarbonate of potash was "commonly called pearlsh."

Please be a little more accurate in your statements, ye gentlemen of the faculties of colleges, if you expect to demonstrate that American pharmacy is undeserving of the occasional reflections cast upon it by our transatlantic brethren.

EXAMINATION QUESTIONS.

We are greatly encouraged by the increasing interest manifested in the series of examination questions which are appearing in these pages. This interest indicates very plainly that druggists and their clerks are by no means unresponsive and slow to take advantage of opportunities for self-examination and self-instruction. The present seems to be pre-eminently an age of progress in matters educational in all professions in the United States, and this feeling and stimulus are existent in pharmacy in as high a degree as in other callings. There is a demand for greater proficiency, there is more expected of the professional man than in the earlier days of the country; legislative restrictions are being drawn closer and closer, and with the passing away of the old ideas the new are forging to the front. Pharmaceutical education in this country has been in a more or less chaotic condition, from which it is, however, emerging with very satisfactory rapidity. The young man is no longer content to serve an apprenticeship, picking up what little information he can at odd times, finally to take upon himself the management of a drug store, trusting to a beneficent Providence to protect him from mischance and the results of possible and probable error. But aside from the legal regulations with which he must comply, he finds the spirit of progress abroad in his profession, and he must, through systematic application to study and work, qualify himself to meet his competitors on equal ground. The drug clerk of to-day is anxious to study, but he often finds it hard to carry on his study to the best advantage and in the proper direction. These questions are not intended to be anything other than what they purport to be, examination questions to test the quality of the student's attainments. They are not to take the place of systematic study at college, or under a preceptor, or by one's self; nor are they intended to coach the student for board of pharmacy examinations, but simply to give him a means of examining into the value of what he has already attained, and to indicate to him where he is deficient and where strong.

We have been surprised and gratified at the general high excellence of the replies so far received, and from the suggestions as to the continuation of the feature we have gained ideas which, put into operation, cannot but prove beneficial. The support so far received is more than adequate to insure the continuation of this feature, and undoubtedly the increasing accumulating interest which succeeding series will draw forth will provide still farther stimulus to the extension of the work.

Answers to the first series of questions will be published in the April 1st Era, and we would request that all replies be in our hands prior to March 15th, that the necessary compilation and comparisons may not be delayed. It is believed best to republish each series of questions until they have been answered in print. We shall be glad to receive suggestions looking toward the increased efficiency of this feature of Examination Questions.

MORPHINE AND POTASSIUM PERMANGANATE.

A certain Dr. William Moor, of New York, has recently gained considerable cheap notoriety by swallowing a poisonous dose of morphine, following it immediately with a solution of potassium permanganate as an antidote. As he experienced no ill-effects from the experiments, he has been joined by the newspapers in claiming that permanganate of potassium is sure to prove of immense service in cases of morphine poisoning, and that it will undoubtedly be employed in the treatment of the morphine habit. This is but another sample of newspaper science, but one that may do more than the usual amount of harm. Were the newspapers to be believed, Dr. Moor should be looked upon as a great benefactor of the human race and his discovery an inestimable boon to mankind. But in truth, there's nothing in it. Potassium permanganate is one of the most easily decomposable of substances, and if it is to destroy the toxic power of morphine it must be administered almost simultaneously with it. Dr. Moor says it will decompose a morphine salt several hundred times quicker than it will decompose albumen, and that it exercises this power of selection in the stomach. Perhaps so, but its action on albumen is so rapid that a grain or two of morphine would have to select it very promptly to effect decomposition. The gases and juices of the stomach and the food which may be present would have a rather discouraging effect upon poor permanganate in its search for morphine, its affinity. And suppose it didn't find morphine, what if it should attack the walls of the stomach in its exasperation of disappointment? We confess we are out and out skeptics in this matter. If the permanganate gets a chance at the morphine before anything else is offered it, both would emerge from the fray in a very battered condition.

But give morphine a few minutes' start and let it hide itself in the circulation, and permanganate wouldn't have a ghost of a show. The proposition to administer it hypodermatically as an antidote in morphine poisoning is ridiculous. The blood itself would rebel against such intrusion and would annihilate permanganate in short order. Dr. Moor tells the reporter that in case of poisoning with opium preparations other than morphine salts, the antidote should be acidulated with vinegar. Text-books and experience

show that acetic acid especially decomposes permanganate, under proper conditions, and it is reasonable to expect decomposition here. We do not belittle the value of permanganate as a morphine antidote in cases where it can get a fair crack at the morphine, but in ninety-nine instances in a hundred its administration would be worse than useless, for the morphine would be well beyond its influence, and there would be grave reason to fear its corrosive action on the stomach itself. It is unfortunate that the matter has been brought to public attention, for even were the application of permanganate proven a valuable discovery, as claimed, this use of it could be of practical service only in the hands of the well-qualified physician, and is not to be entrusted to the layman.

ILLINOIS BOARD'S INTERPRETATION OF THE PHARMACY LAW.

In the Illinois pharmacy law occurs the provision that nothing in the act "shall apply to nor in any manner interfere with the business of any physician, or prevent him from supplying to his patients such articles as may seem to him proper, nor with the making or vending of patent or proprietary medicines, or medicines placed in sealed packages, with the names of the contents and of the pharmacist or physician by whom prepared or compounded, nor with the sale of the usual domestic remedies by retail dealers, nor with the exclusively wholesale business of any dealers."

This section has received varying interpretations, which fact has caused the state board of pharmacy to promulgate the following definition:

Coppers, sulphur, saltpetre, rosin, glauber salt, turpentine, to be sold as stock remedies only.

Water of ammonia, sal soda, soda ash, boxes for washing and soap-making purposes only.

Alum, ammonium carbonate, sodium bicarbonate, cream of tartar, for domestic use only (not medicinal).

Castor oil, for lubricating purposes.

In further explanation the board says: The sale of ordinary drugs and medicines by other than a registered pharmacist, is provided for in section 12, Pharmacy Law (quoted above). Such articles as quinine, epsom salts, castor oil, paregoric, spts. nitre, sulphur, saltpetre, and all other ordinary articles of drugs or medicines (and poisons) used for medicinal purposes may be sold by general stores, if put up in sealed packages and properly labeled by a registered pharmacist of Illinois. (The label should have the name of the Pharmacist and the words "Registered Pharmacist of Illinois," certificate No. , with proper directions for use thereon.) The sale of these articles put up in unobscured packages or manufacturers nor R. P.'s in Illinois is not legal under the Pharmacy Law.

The sale of patent medicines is prohibited by the Pharmacy Law, but this does not include articles known as pharmaceutical preparations. The Supreme Court has decided that quinine is not a domestic remedy, and the Circuit Courts have decided time and again that the articles enumerated above are not domestic remedies. The words "Usual Domestic Remedies" in the Pharmacy Law, taken in connection with the proviso in the same section of the law for the sale of medicines by others than registered pharmacists for medicinal use, shows conclusively the distinction made by the law between drugs and medicines for medicinal use, and those for domestic use, making a special distinction between domestic and medicinal. It is clearly the intention of the law, and the board so defines its provision.

With the exception of a single sentence in the board's definition, its interpretation of the law seems satisfactory. This

exception is the statement that the sale of patent medicines is prohibited by the law. We fail to see how this construction can be put upon that paragraph of the law (sec. 12), which definitely provides that nothing in the act shall prevent the making and vending of patent or proprietary medicines. We are inclined to think that in the circulars issued by the board the word "not" has been unintentionally omitted, and the clause should read "The sale of patent medicines is not prohibited, etc." One objection urged against all our pharmacy laws has been that they make an exception in favor of patent medicines, allowing their sale by anyone, and we do not understand that the Illinois differs in this respect. It is important that the error (if it be one) in the board's circular be corrected.

THE WORK OF THE INTERSTATE LEAGUE.

A full report of the meeting of the Interstate Retail Druggists' League, held in New York the early part of last month, was presented in our last issue. The drug trade has read this report with much interest and with the natural desire to learn what the League has done and is doing for the protection of the retail trade in the sale of proprietary preparations. Aside from the usual routine business, the principal action taken was to suggest a modification of the Detroit plan, by which modification it is proposed to restrict the sale of these goods by the proprietors to "wholesale druggists" rather than to "wholesale dealers." This demand on the part of the League is one which say will render the entire plan inoperative, from the fact that the manufacturers will not consent to adopt the proposed change. These proprietors claim that a large share of their products are distributed through the agency of dealers other than druggists, and there are some medicines which are nearly entirely so distributed. It is very desirable to restrict the sale of patent medicines only to wholesale druggists, but we must not lose sight of the fact that the idea of the plan is primarily to protect the trade against cut rates, and the proprietors who adopt it agree that whoever their wholesale customers are, whether druggists or general dealers, cutting of prices and selling to cutters will not be allowed. This it seems is what the drug trade has a right to ask and what it has been asking, and the League through its representatives at the last meeting of the N. W. D. A. expressed itself in favor of the plan as proposed and now makes the very decided change of substituting "wholesale druggists" for "wholesale dealers." We all have very strong desire to see the League succeed in its avowed purpose of advancing the material interests of the retail drug trade, and we believe that the majority of jobbers and proprietors see the necessity, even from selfish motives alone, of protecting the retailer in his profits on these goods. Various plans, of very radical characteristics, have from time to time been proposed and attempts made to enforce them, but from the fact that they were so very radical and implied such great changes in the manner of conducting trade and necessitated a very complete detective system to make them operative, they have one by one sunk into oblivion. The Detroit Plan is, as it has been well termed, a compromise measure, not wholly satis-

factory to either side in all respects, but it is well worth a trial. It is impossible to state whether the League's action will prove a bar to the enforcement of the Detroit Plan or whether it will result in good, but the fact remains that the change demanded is a very important one indeed, inasmuch as it restricts the proprietor's list to a much smaller number of customers and he may see fit to refuse any support whatever to it.

TEST YOUR PHARMACEUTICALS.

The custom of some pharmaceutical manufacturing establishments of giving the same discounts to retailers and jobbers has brought about a condition of affairs not altogether satisfactory. The manufacturer can give, say 40 per cent discount to the retailer, while the jobber can give but 25 per cent if he is to get any return for handling the goods, nor can the jobber retail the articles, for such a course promptly brings him into trouble with his retail trade. Farther than this, the practice is detrimental to the retailer's interests in that these goods quickly find their way into the cutters' hands and the retailer sees his trade in them leaving him. All this has led to the establishment by certain jobbing drug houses of the manufacture of pharmaceuticals of their own on which they can get all the profit. We find, therefore, upon the market preparations of all characters, of widely varying degrees of quality, and the business in these goods appears to be characterized by those unpleasant features which attended the memorable encounter of the Kilkenny cats. Just what will result from Mr. Weller's resolution, presented to the N. W. D. A., to the effect that something be done to establish uniform list prices and for the correction of the abuses outlined, it is impossible to predict, but that a change is desirable cannot be denied. When a druggist finds before him a dozen lines of fluid extracts or other pharmaceuticals, each claiming to be official, but evidently differing greatly, it surely is wisdom on his part to inquire pretty closely into the relative values of the articles.

PHYSICIANS AND PATENT MEDICINES.

Medical journals and physicians quite generally accuse druggists of catering to the patent medicine trade and assign this as one of the causes of the strained relations which often exist between physicians and pharmacists. While the pharmacist is culpable, as charged, it is nevertheless true that the physician himself is equally or more responsible for the trade in patent medicines which he hypocritically deplores; and farther than this, we think that it is true that druggists as a class are more honest in their efforts to bring about an improved condition of affairs than are the physicians. We have seen physicians' prescriptions which called for full packages of well-known proprietary medicines, and a large proportion of all prescriptions designate some particular make or some particular brand which in many cases is just as truly a secret preparation as are what are more generally known as patent medicines. There are certain lines of so-called pharmaceutical preparations of which nothing is known save what is found upon their labels, and which is very often no true criterion of the value and true nature of the contents

of the package. If the medical profession, as a whole, does not wish the trade in proprietary preparations continued, they should first purify their own ranks and stop prescribing secret preparations before laying all the blame for continuance of their use upon the shoulders of the druggist. The druggist has enough to bear in the way of responsibility for his own portion of the secret medicine traffic, but he should not be held accountable for all of it.

LIABILITY OF DRUGGISTS.

Hon. David McAdams, Judge of the Superior Court of New York City, recently delivered an address before the Society of Medical Jurisprudence upon the topic "Malpractice as Defined by Law." Those portions relating to druggists are abstracted by the Alumni Journal as follows:

"The rule of liability of a druggist who delivers a deleterious drug to one who calls for a harmless one is the same as that which governs the liability of professional persons whose work requires special knowledge and skill, and a person is not legally responsible for any unintentional consequential injury resulting from a lawful act when a failure to exercise due and proper care cannot be imputed to him.

"An action against a druggist for an error of his clerk in compounding a prescription rests upon negligence, and a right of recovery does not arise from the mere fact that a drug given was not included in such a prescription, as the defendant is entitled to have the question of the competency of his clerk and the exercise of due and proper care submitted to the jury.

"In such case, when the defendant assumes to fill the prescription, undertakes that he possesses the ordinary skill of a druggist or apothecary, and that he will exercise due and proper care in putting up the medicine required, the degree of care being proportionate to the gravity of the injury that would necessarily result from a want of care, the failure to exercise due and proper care is the only ground upon which recovery can be had in such an action.

"One who is ignorant of the properties of a poisonous drug is liable to a criminal prosecution for a negligent sale or use thereof.

"A druggist who grinds medicines in a mortar which has been used to grind poisons without properly cleansing it is liable to one injured by means of such careless use. So of a druggist on shipboard who neglects cleansing drinking utensils after using them with poisonous substances. So of a druggist who sells morphine instead of quinine, which causes death.

"A druggist who sells a deadly poison as a harmless medicine is liable, and one who labels a deadly poison as a harmless drug is liable for all consequences."

A German medical man, Dr. P. Furbinger, has been investigating peanuts, and finds that they contain 47 per cent of albumen, 19 per cent of fat and non-nitrogenous extractive matter. He recommends their use as a food on account of their cheapness, and finds that they possess medicinal qualities which make them suitable for employment in corpulence, diabetes, and certain kidney diseases where foods rich in animal albumen must be avoided.

PURCHASE BY INSTALLMENT.

By S. P. Whitmarsh.

In the majority of mercantile exchanges from time immemorial, each transaction has been complete, leaving both parties concerned to reflect on the gain and loss sustained and to accept the lesson of experience as a guide for the future. From the barter system of savage tribes to the usages of higher civilization, the transfer of personal property has been by mutual consent, consummated either by payment and delivery or delivery on a credit accompanied by good security. In this way human wants have been supplied by human agencies, generally at the minimum of cost; while the questions of value and economy of expenditure remained, to be settled by the means or tastes of the buyer.

The intrinsic value of each investment, whether large or small, if an actual need led up to the purchase, can be easily ascertained, and mistakes of judgment need not cause lasting regret. (It may be proper to add that a horse trade is distinctly excepted in these statements; since few instances are on record where both parties enjoyed the luxury of a good bargain.) In the exigencies of personal needs a departure from the safe rules of mercantile ethics has been taken that in course of time became a practice injurious to the interests of both buyer and seller. Thus originated a general credit system that had no regard to the needs of the customer; but only pandered to his wishes, that were never denied so long as he was supposed able to pay at some time not very remote. The desire to sell goods at every hazard, and the tempting inducements held forth, have tended to subvert habits of economy so necessary to all who are in the possession of moderate incomes. The temptation to buy in advance of ability to pay lies at the root of many evils, though this be ascribed to other causes. The desire to keep up appearances with people of larger means only needs the opportunity that a careless system of credit affords to place the citizen with a small income, if he be an honest man, on the rack of anxiety concerning how he is to pay for goods bought under such alluring conditions.

And now comes in the installment plan of selling goods to add more discouraging features to a credit system already stretched beyond a safe limit for the seller, and demoralizing in its effects on the consumer. This system is more common in cities and towns, wherever customers are to be found with steady incomes from weekly or monthly salaries. Those who practice selling in this way defend it on the ground that it is the cheapest and often the only way for people of small means to purchase articles of household use, the price of which would cover the earnings of several weeks. They forget that it is as easy to save in advance of purchase as it is afterwards. Besides, as the price is usually made higher to compensate for interest and the chances of loss by waiting, there is a better way for the buyer to attain his end in which he need not be compelled to such painful economies. The sum so often spent by the installment plan on a stove, chamber set, sewing machine, or musical instrument, if put by little into a savings bank would save the prudent buyer at least 25 per cent,

as compared with the wasteful methods now so common, besides many a heart-ache or forced sale.

But such financiering is too heroic and slow to suit the present age. To a large class of well meaning people the persuasive tongue of him who asks them to buy on a different plan makes music that charms the mind away from the warnings of common prudence, and lays a foundation for many useless regrets. They are tempted by the smallness of payments to add many comforts that might well be spared for a while, and even some luxuries, without a realizing sense of the aggregate obligations assumed. The sum total that seems far distant and the trilling weekly or monthly payment obscure one's vision until the investment has gone too far to be recalled. In many cases all future earnings for months are mortgaged to an inexorable fate, leaving nothing to meet emergencies such as sickness or death. Often the physician who generously attends them in utmost need is kept out of his well-earned moderate fees because some installment contract, made in haste and repented of at leisure, has drained the household purse that would with ordinary prudence never have been found empty.

It is very common for writers on political economy to attribute the evils under which so large a portion of our population are kept poor to vicious or criminal habits. But one who observes will find that the most frequent producing cause is improvidence; and a large part of that improvidence may be charged up to the practice of buying goods on the installment plan of payment.

Outside of those who purchase for personal or household use no class furnishes such object lessons in improvidence, and so many inexcusable victims to this pernicious scheme of trade as the druggists. The motive of the buyer is the same as in cases above noted, and his hopeful, buoyant spirit sees visions of future prosperity and complete possession, through a silver stream of nickels and dimes that seems sure to flow boundlessly into his purse in the "Sweet Bye and Bye." In this elastic frame of mind he receives the fascinating tale a solicitor for his trade unfolds to his astonished senses. And listening, he becomes hypnotized till he is ready to sign anything that will give him an opportunity to realize the results so eloquently set forth.

With him "to hesitate is to be lost." He forgets for a time that he is a business man and believes the other fellow is talking business. So he is—for himself—and the horse he represents; and not for the one on whom he has been spending exaggerations with such powerful effect. Before there has been time for sober second thought to make out a search warrant for common sense to produce disenchantment the fatal contract is signed with all its dips and angles, by which he binds himself to pay by installment a sum total for an article equal to from four to six times the actual cost of the manufacture, the said article to be and remain the property of the seller and insured by the purchaser till the uttermost farthing of principal and interest has been paid.

It is perhaps safe to say that once in a hundred times men have signed such a one-sided document and escaped without loss. But the discount in value from the

purchase price after a sale has been made reminds one of the fall of the mercury in a Nebraska blizzard. In ninety-nine cases the article stands a monument to the deceased judgment of the buyer without regard to whether he ever completes payment and acquires possession or not.

The installment plan of purchasing may be a nice thing for a millionaire to try within his hours of leisure, as he would with a picture, statue or any other work of art; since he does not separate the real from the esthetic value in articles which please his taste or imagination. But a struggling druggist who is threatened by the cut-rate, green-grocer's competition and whose business stand is outside the fire limits of any large city, has enough to risk in the ordinary vicissitudes of business without investing in an article which, while it may for a time be a "thing of beauty," can never be to him "a joy forever."

The taxes levied on purchasers over and above the actual value of goods sold, represent the last straw that has overloaded many worthy men and firms and sent them into bankruptcy. No article that is loaded with 400 per cent and more of profit can be a safe venture for any business man. If it were not for the installment plan of selling goods no such profit could be realized and the loss now sustained by purchasers would be reduced so as not to exceed what may be looked for in other lines of business.

The evil of methods above described does not lie in the fact that they are in any respect dishonest or illegal, but that they tempt to extravagance in outlay which should ever be avoided by those who wish to thrive. They are like many others of the present time, thoughtlessly accepted by those whom one would suppose more alive to their own interests, and seeing this, the reform must come, if at all, from the buyer.

HOW TO DETECT HORSEFLESH.—

We do not at present see any particular application for a test of this nature, which is described by Brantigam and Edelmann in Pharm. Centrall., but perhaps, in Europe, where Chicago dressed beef is not very plentiful, man's greatest friend, the horse, is often sacrificed to provide food. In fact, we have heard of meat markets in Europe where horseflesh was made a specialty, and perhaps a test to establish its identity is desirable, not that one may not eat it unawares, but that one may be sure that he gets horseflesh when he wants it. The method is based upon the well known iodine reaction of glycogen, a substance that is always present in horseflesh. The flesh is finely divided, boiled with four times its weight of water, and the solution treated with dilute nitric acid to precipitate albuminoids, and then filtered. To the filtered solution is added hydriodic acid in such a manner that two distinct layers are formed, which at the point of contact will show a red or violet zone if glycogen be present. If the reaction is not distinct, showing insufficient extraction of the glycogen from the flesh, it is directed that a solution of caustic potash containing potassium hydrate equivalent to 3 per cent of the weight of the flesh be substituted for water in the extraction. This reaction is said to be characteristic, as the flesh of other animals than the horse does not contain glycogen.

[Written for the Era.]

A REPLY TO MR. N. H. MARTIN'S CRITICISM OF THINGS AMERICAN.

By F. M. Goodman,

Dean of the Chicago College of Pharmacy.

I enter upon a reply to the criticism of Mr. Martin with the kindest feeling, for he has made such gross mistakes that I feel sure he will be pleased to be set right and have pointed out to him how he might have learned more of American customs and American pharmacists than he did. His communication shows him to be a thoughtful and observing gentleman, and such a one as Americans like to meet. We are not as a nation very sensitive, but rather like to be criticised for. If just, we always try to turn others' ideas to personal profit. Upon considering the subject I am led to say that in framing this reply I find would take two texts, one for myself and one for Mr. Martin; for my own I would quote the Scottish bard: "Would some pow'r th' rattle gie' us, to see oursel's as thers see us," and his I would take from the Scriptures: "I was a stranger and ye took me in."

The gentleman enters upon his detailed remarks with such earnestness that, when in reading, I come to the remark relating to our railway service, I can hardly persuade myself that he has not ruptured a facetious vein and is trying to pass off a little witticism without a smile, so I will be just as earnest as he seems to be. He says: "There is simply no comparison between the smooth precision with which our trains run and the rolling motion of an American express train. It rolls and rocks worse than a ship does at sea, except in a storm." This makes one smile, and were it not for his apparent belief in his own statement, I would simply pass it by as an hyperbolic expression. This point, however, to make sure, I referred to my own father, who was born and brought up in Hertfordshire, on the outskirts of London, and who paid his old home a visit a few years ago. He said: "My experience is that one riding in what are regarded as first-class trains could not tell in which country he was riding, so far as motion is concerned." We may freely admit that English roads are finely ballasted, and we know they have fine coaches, for America makes a good many for them; but let me offer a quotation on this point from the *Encyclopaedia Britannica*, Am. Ed., 1892: "In no country in the world are the equipments and appointments for railway travel equal to those available in the United States. To a substantial roadbed, thoroughly ballasted and laid with steel rails, is added rolling stock unsurpassed in respect to construction, elegance and appliances for the promotion of the comfort of travelers. These acquisitions, which have come into universal use in the United States, are gradually being adopted in England and other European nations." But, while we may agree with Mr. Martin that all roads of England are in fine condition, we cannot say that for all of our own; the reason is, we have as much to look after. In 1886 the United Kingdom had only 19,332 miles in operation, while we had 150,000. I am sorry Mr. Martin overlooked mentioning our system of checking baggage. We consider that a great improvement over looking after one's "luggage" personally, and recommend it for European adoption.

The gentleman pays us a very pretty compliment when he says that upon being called upon to speak. "It was embarrassing and would have been more so except for the manifest courtesy and kindness of the listeners, who seemed to know what I ought to have said and who were sure I would have said it if I could." In this reply I purpose simply extending this courtesy, for I am in a position to know what the gentleman "ought to have said."

His criticism of the American Pharmaceutical Association: "One thing struck me very forcibly, and that was the volubility with which men read papers and discussed views and practices, without the least intention or thought that they would have a practical bearing. It all seemed academical and inconsequential," is very mild; it might have been much more pointed to advantage; and I feel that he is fully aware of it and is not criticising according to just impressions.

"With regard to education" the gentleman does not read between the lines: "Most of the colleges, as the complement of an attendance upon their prescribed course and a more or less serious examination, confer upon their students the title of 'graduate in pharmacy,' but so slight is the confidence reposed in its meaning anything, that at the meeting of the A. P. A. in Chicago the following report was unanimously adopted in the section on legislation: " * * * It is the sense of this section that the best interests of pharmacy are secured by the non-recognition of diplomas by the state boards." If Mr. Martin had inquired into the meaning of this he would have been told that physicians demand registration as pharmacists on the strength of holding a diploma from some medical college or other wherein pharmacy is not even taught, and in order to overcome this it was necessary for pharmacists and schools of pharmacy to insist upon the examination of all who desire to enter the ranks. It does not belittle the degree of graduate in pharmacy in the estimation of Americans, and it is no hardship for college graduates (pharmacal) to pass these board examinations.

The gentleman speaks of: "Crude and raw students, with as little as fifteen months' practical experience of the drug business, and being under age, having been granted diplomas. The dean (sic) of one college claimed that 'every American college is doing the same thing.'" In the first place, the "sic" should have been placed after "college," as well as after "dean" in this quotation. Then, does Mr. Martin really believe that, in a country as vast as ours, "there are none righteous; no, not one?" and that every American college is doing the same thing, carrying on illegitimate work? and this because one disgruntled dean told him so? Verily, the gentleman was a stranger and was taken in. He evidently fell in with the wrong dean to get correct information. As a heritage from our great forefather, "We cannot tell a lie," Mr. Martin's informant may be pleased to be considered an American, but he is not properly constructed to be a true one. And when the gentleman speaks of pharmacal journals admitting "the existence of the evil, although some of them 'hedged,' but it was mentioned as a significant fact that those journals were the organs of the college complained of," he brings things down to a very fine point,

for there is but one college of pharmacy in Chicago which publishes its own organ. He speaks of organs and colleges as though every college he intended to criticize had its own organ to blow. Then, after quoting a question raised in the A. P. A., he falls into the Chicago College of Pharmacy just as specifically as though he mentioned its name in full, for no other college has the curriculum it has, and he has quoted word for word from its announcement. So, I may be pardoned for trying to correct the wrong statements he has been led to make.

The A. P. A. question referred to was: "How can colleges of pharmacy be placed upon a purely educational basis, instead of being conducted for the money they can make?" If Mr. Martin had called upon the dean of this college, instead of being taken in by the dean of some other college, he would have had this question answered in a way that would have surprised him, for he would have learned how it has already been done in this city, without looking to the very small and uncertain income of "one-fourth the sum now expended for association entertainments and commercial interests." Colleges of pharmacy can be placed upon a purely educational basis by being conducted as the Chicago College of Pharmacy is. It belongs to no corporation, company or individual; it is managed by a board of trustees selected from the pharmacists of the city, each member freely giving his services for the good of pharmacy, without one cent of compensation; it is not conducted for profit, and no dividends are ever declared. It has been thus conducted since 1839. Its classes by far outnumber those of any other college in the west, and all funds received are spent in educating the students.

The gentleman caught onto this question as though it was enigmatical, but he will see that it is not. Some colleges of pharmacy are run for the money there is in it, but this one college is run for educational purposes. Further, a gentleman visiting us from a foreign country and one whom we treated as such, should have offered quotations in full instead of selecting a few words here and there, and putting them in quotation marks. It reminds me of the disgusted patient who wrote to the patent medicine man: "I have taken six bottles of your medicine, and I say you are a fraud. I think there is not another medicine like it in the world; it is a perfect humbug. Publish this if you wish to, you contemptible quack." Yours, A. B. C. The next lot of advertisements contained: "I have taken six bottles of your medicine and * * * I think there is not another medicine like it in the world. * * * Publish this if you wish. * * * Your, A. B. C."

Mr. Martin tells this same sort of truth. He says: "One college even advertises the fact that students attending it can obtain situations easily and earn enough for board and lodging." He would thus convey to his readers the notion that such was the American idea, and the idea of this college in particular, but here is the sentence which he pretends to mention: "While the lectures and laboratory exercises present to each student enough mental and physical work to occupy his whole time, still the hours of lectures and exercises are so arranged as to permit students who desire, to serve a part of their time in stores, thereby defraying their

personal expenses. This is especially desirable for junior students who may lack practical experience in a city pharmacy. With three days and every night in the week to themselves their services in a pharmacy may be worth sufficient to pay for board and lodging.

Then: "With regard to practical work, we find that one of the colleges, which boasts that 'the facilities for laboratory instruction are unexcelled in this or any other country,' and has a botanical laboratory, a microscopical laboratory, a chemical laboratory, a pharmaceutical laboratory and a dispensing laboratory, condenses its practical work into two hours twice a week for twenty-five weeks." The sentence referred to reads:

"No pains have been spared to make the lecture course as complete and thoroughly adapted to the wants of the profession as possible, and it is believed that the facilities for laboratory instruction are unexcelled in this or any other country."

In reply to this I will state that when this college was destroyed in the great fire of 1871, our British friends sent us a good-sized library, a deal of the most expensive apparatus used in the microscopical, pharmaceutical and chemical laboratories, and to these are being constantly added the most approved apparatus. The gentleman probably did not like the reference to "any other country," and so attempts

to belittle the college which is proud to call its capacious lecture room "Attfield Hall," and which is equally proud of the life-sized portrait of Prof. Attfield, which hangs on the wall above the lecture stand. We thus show our appreciation of the kindness from abroad, extended to us in our hour of trouble, and which started us on our way to a full realization of the statement made in our announcement.

On page 3 of the College Announcement is: "The course offered by this college comprises twenty-eight weeks, devoted to lectures and reviews and laboratory work," and the time card shows six laboratory hours on Monday, twelve on Tuesday, six on Wednesday, twelve Thursday and three Friday, and yet the gentleman says this college "condenses its practical work into two hours twice a week for twenty-five weeks," whereas every minute of the time is spent as is outlined in announcement and time card. Our botanical laboratory is the microscopical laboratory, and flasks are not made otherwise; nowhere is it stated that we have the two laboratories mentioned, and yet this gentleman, who has visited America twice and who says: "I do venture to think the opinions I have formed are based upon a reasonably accurate acquaintance with and interpretation of the facts of the case," comes to these unwarranted conclusions, and in turn tries to mold the opinions of others.

He then starts in to ridicule the idea of giving lectures on anatomy, physiology, and the application of medicine to disease, and the application of trusses to hernia. "I think the gentleman and his confederates will agree with me that every student of medicine should know something of nature's laws. 'Know thyself' is still the meaning. The pharmacist is frequently called upon to suggest remedies, and these lectures demonstrate to them that they cannot even recommend a cathartic intelligently without a knowledge of how medicines act, and this is incomprehensible without a knowledge of anatomy and physiology, and an interesting outline of

these studies is offered in order to induce them to study more profoundly. Mr. Martin simply failed to translate the object of these lectures, and does not, when in an unbiased frame of mind, really imagine that by this college "students are supposed to be so proficient in these various studies that time is found for lectures on anatomy, etc.," I know he does not, therefore I will explain: In teaching materia medica therapeutic action is always mentioned, the text will say, for instance, "Opium is useful in all forms of diarrhoea. Why? Because it influences the peristaltic action of the primæ viæ. It will state, also, that a certain cathartic affects only the small intestines, and another only the large, another will relieve headache by its revulsive action, another by the same action will prove to be an emmenagogue. Now, how can a student comprehend such teachings without some knowledge of anatomy and physiology?"

Further, many of our pharmacists sell trusses. This college tries to do its best to fit the graduate for any position in a pharmacy; can a man intelligently fit a truss without some knowledge of the pelvis and femoral region? I hope the gentleman will live to see these same branches taught in every well-organized college of pharmacy.

Mr. Martin's next observation is "Amongst 'elective subjects' we find lectures on the origin and location of mankind, the origin of trade, botanical gardens and medical practice," but in order to induce the student to "elect" to follow these, he is assured that "the subject is very interesting and takes up two lecture hours." I am so sorry that the gentleman did not fall in with a Chicagoan and imbibed some truth. In the first place, this college has no "elective subjects," and a student cannot "elect" to follow or elect not to follow, and when he offers this quotation so slightly in order to think that he regarded such information of no importance, but I might call his attention to the fact that one of the most famous of works, the "Pharmacographia," appends historical notes to almost every article, and Flueckiger & Tschirch, in their "Principles of Pharmacology," bestow about forty-five pages on history and botanical gardens. We go farther, and start with the dispersion of the Aryans as outlined in Freeman's historical course, and trace the development of people and drugs side by side, and it is pronounced interesting.

With regard to botanical gardens it is a well-known fact that tracing their development is watching the development of the science of botany itself, and while our British friends have their famous Kew and Apothecaries, we, too, have some equally famous, though not as old as the Washington and St. Louis, and it was the establishment of one in Chicago, founded in South, or Jackson Park, which furnished the world's fair its site, and, incidentally, it was Prof. Babcock, of the Chicago College of Pharmacy who above all others, was selected to establish and work after it.

The gentleman's knowledge of the workings of some of our state boards is just as rude as is his information concerning colleges of pharmacy. He says: "There are no specially fitted up rooms or laboratories suitable for the conduct of practical subjects," etc., while in truth the state board have elaborate compartments

permanently located on Thirty-ninth street of this city.

But as I have already made my reply more extended than I expected to, I will not ask for further space, but will leave other inaccuracies uncorrected.

THE RELATION OF TEACHING TO RESEARCH IN CHEMISTRY.

By W. E. Stone.

It is eminently proper that this Congress of chemists should devote some portion of its attention to the teaching of the science. This not alone because it is desirable that chemists be well taught, but also by reason of the prominent place chemistry has secured in the curriculum of every college and university as well as in many high schools. The teaching of chemistry in institutions of learning is a modern innovation, introduced and developed within the memory of living men. The chemical laboratory as a means of instruction was first recognized in America about thirty years ago. Now the chemical lecture room and laboratory form an essential part of the equipment of every institution for higher education. It naturally follows that teachers of chemistry have become numerous, and positions of this kind are the goals toward which many young chemists aspire.

The teaching of chemistry has therefore become a kind of profession with its own peculiar limitations and disappointments as well as pleasures and aspirations. The discussion of methods and details of teaching chemistry I leave to the speakers who are to follow me. I wish, however, to consider briefly what I regard as a most important feature of didactic chemistry, viz.: The attitude of teachers of chemistry toward research.

A survey of the field reveals an interesting comparison between America and Europe in this respect. In the European universities we find the teachers of chemistry including the famous investigators and discoverers. It is a recognized function of the teacher that he be also an investigator. Indeed his appointment to a chair in any of the great universities is dependent upon his standing as an investigator and he retains his position only so long as he maintains this standing. In short, one of the necessary qualifications of the teacher is active participation in scientific research. Turning to America, two features are at once noticeable. First, a less degree of activity and attainment in scientific research, and second a weaker interest in the spirit of investigation. We must acknowledge that our teaching and the results of our research are still inferior to those attained abroad. The reasons for this are probably complex, but chiefly they are to be sought in the relations of our teachers to investigation. Certainly our teachers of chemistry do not lack training, for many of them have been trained under the masters abroad which we recognize as superior. They do not lack enthusiasm because there are many young men with the successes and examples of their European preceptors still in mind. Our American teachers are not at the head in their profession by reason of any lack of training or enthusiasm or mater-

*Opening address by the Chairman of the Section of Didactic Chemistry at the World's Congress of Chemists, Chicago, August, 1893. Reprinted from Jour. Amer. Chem. Soc.

laid equipments. If I ask then why, any one of my hearers can answer promptly. Every American teacher of chemistry has a common complaint to voice. They will tell you that the demands made upon them as instructors are alone culpable for their meager contributions to the annals of research. Too many students. Too many hours of teaching. Too many subjects to be taught. These are the counts in the indictment against the conditions under which our American teachers exist.

In short, to sum up the existing status, we find ourselves somewhat in the rear of the foremost ranks of investigators and teachers. We find these branches most flourishing where the activity of the investigator is a required qualification for the teacher. In our own country we find these requirements of secondary moment or they are lost sight of entirely. This seems to me not only a great fault in our educational system, but also a very serious hindrance to the progress of American chemical science.

I am aware that some will fail to see the relation between teaching and research in chemistry and will maintain that the teacher should be only teaching and the investigator only occupied with investigation.

We may regard this matter from the standpoint of the student, from the standpoint of pure science, and finally from the standpoint of the teacher himself.

The student has a right to expect instruction in chemistry either as part of a liberal education or as preparation for a professional career. In either case it is or should be taught, not as a dead and completed science, but as a constantly advancing, vital, living science. It is or should be taught as a science of investigation. The only one who can teach it as such must be himself an investigator. No one would maintain that the discoveries of Woehler or Hoffman did in any way detract from their effectiveness as teachers. On the contrary, it is apparent that in their characters as investigators they transmitted an inspiration to their pupils which has given to modern chemistry an incalculable impetus.

Again, science looks mainly to teachers for its advancement, since, as a rule, they alone have or should have at command the necessary funds, materials, and equipments for the prosecution of researches. Moreover, they alone have or should have the leisure and unbiased mind so essential in the search for truth.

Lastly, the teacher himself has no right to content himself with the single aim of the pedagogue. If he would not stagnate, he must advance. He must be himself a student, standing as interpreter between the unknown and his pupils. The true attitude of the teacher of chemistry to forward research is one of interest and active participation in precisely the same degree as he manifests interest in and sympathy with his pupils.

MIGRAININ is a compound of antipyrine, citric acid and caffeine, which has been found very effective in cases of severe hemicrania, in doses of 1.1 gram in aqueous solution. The patient should lie down for an hour after taking the dose, which may, if necessary, be repeated in a couple of hours.

Tea seed oil is much used in Southern China as an illuminating oil.

RECENT PROGRESS IN CHEMICAL TECHNOLOGY.

By Samuel P. Sadler, Ph. D.,
Professor of Chemistry in Franklin Institute.

Looking at the specific relations of chemistry to the mechanic arts, it has seemed to me desirable to open the series of chemical lectures with a "Review of Recent Progress in Chemical Technology."

In the production of the metals, the most notable advances made in recent years are those which concern the light metals, aluminum, magnesium and sodium, and these advances have been largely coincident and connected with the great improvements in applications of electricity. Thus, until the issue of the "Patented" patents in 1885, aluminum was manufactured solely by the Deville process, at Salindres, France, and later at Oldbury, near Birmingham, England, under Webster's patents. In 1885, the Cowles electric process was made public and has continued in use to the present time. Heroult's process, also an electrical one, was patented in 1887, and is at present being worked on a large scale, both in Switzerland and France. Hall's process, patented in 1889, and Minet's, which is practically identical with Hall's, however, represent the most successful applications of the electrolytic method to the production of the metal aluminum. So it has come about that the Aluminum Company, of Oldbury, England, although it has cheapened the price of sodium under Castner's patents and controls Webster's Improvements on Deville's process is unable to make aluminum in competition with the electrolytic methods and has retired from that field. In this country and in England, the two processes now in use are those of Hall and Cowles, while on the continent, the Heroult and the Minet processes are followed.

The production of aluminum in 1892 was as follows: In the United States, 133,779 kilos; by the Aluminum Industrie Actien-Gesellschaft, at Neuhausen, in Switzerland, 286,100 kilos; and by the Societe Electro-Metallurgique Francaise, Isere, France, 69,000 kilos. The English production I have not seen stated.

At the Columbian Exposition the raw materials and the products of the aluminum industry were very satisfactorily shown by the Pittsburg Reduction Company, and some individual exhibitors in the galleries of the Mining Building. The bauxite used as the source of the alumina is now mainly supplied from the Alabama and Georgia deposits, which were also well illustrated in this connection.

As the Aluminum Company, of Oldbury, England, as just stated, have had to retire from the competition with the electrolytic processes, they have devoted themselves to the production of sodium and, in looking for new utilizations for the metal, have brought out sodium peroxide as a commercial product. This has already found a large sale for wool and silk-bleaching and other purposes for which hydrogen peroxide has been used. As compared with barium peroxide and hydrogen peroxide (10 volume solution) it contains available oxygen as follows:

93 per cent sodium peroxide	19.5
51 per cent barium peroxide.....	8.6
10 volume solution hydrogen peroxide 1.6	

(An Introductory lecture to the Chemical Course at the Franklin Institute, 1893-94. Reprinted from the Jour. Franklin Institute.)

It is made, according to Castner's patent, by treating metallic sodium contained in aluminum vessels at a temperature of 300° C. to the gradual oxidizing action of a mixture of oxygen and nitrogen in which the proportion of oxygen is gradually increased. This is done in an iron pipe which passes through the furnace and along which a current of air is passed from one end. The vessels containing the sodium pass along the entire length of the pipe, the sodium being oxidized at first by air which has almost been deprived of its oxygen, the proportion of the latter gradually increasing until it is finally oxidized by air containing the full amount of oxygen. The product is a yellowish white partially powdered substance, which dissolves in water with considerable evolution of heat. It may be used to develop hydrogen peroxide just as the barium peroxide is used, or used direct with the addition of a magnesium salt in order to convert it into magnesium peroxide, the alkalinity of the sodium peroxide when taken alone being injurious.

In turning to the metallurgy of the heavier metals, there are improvements capable of being discussed in the case of many of them, but for the purposes of this review we will have to choose only the most prominent for mention. The one which has certainly attracted the most attention on the part of chemists is the so-called "cyanide process" for the extraction of gold and silver from their ores. While the fact of the solubility of gold and silver in cyanide of potassium solution has been known for years and applied in electro-metallurgical processes, the application of this solvent power of the cyanide for the extraction of the finely disseminated metal from the ore has only been made in the last few years. The process has been applied in the United States under the patents of Simpson and others and on a larger scale in the South African gold fields under the patents of MacArthur and Forrest. The process as applied to gold ores is in outline as follows: The damp tailings are charged into wooden vats of a capacity of fifty to seventy-five tons and the vats filled to within a few inches of the top. Cyanide solution of 0.6 to 0.8 per cent strength is then allowed to flow into the tank until it is completely filled. This solution is allowed to remain undisturbed in contact with the ore for twelve hours. Each vat is provided with a false bottom covered with some straining material, usually cocoanut matting. Below this is a layer of coarse sand and pebbles, through which the solution percolates. An iron pipe communicating with the vat below the false bottom takes the filtered solution to the "zinc boxes," when precipitation takes place. As the liquor is drawn off during the leaching process, it is replaced by fresh solution. This operation is continued from six to twelve hours, according to the value of the tailings. At the end of this period, which is known as the "strong solution leaching," a weaker solution (containing 0.2 to 0.4 per cent cyanide) is turned on and allowed to filter through the ore for about eight to ten hours. When this is drawn off a quantity of wash-water about equivalent to the moisture originally contained by the ore is run in and the weak cyanide solution so displaced. The amount of cyanide solution used is about half a ton of strong and half a ton of weak solution for every ton of ore treated. This part

of the process has been modified by pumping back the solution as it filtered through the bottom of the vat and so keeping up a circulation of the original solution for some thirty-six hours. The extraction of gold by this circulation system was equal to that obtained by the ordinary method and the consumption of cyanide was much less. The cyanide solution carrying the gold dissolved now goes through wooden troughs, commonly known as "zinc boxes," where shavings of zinc cause the deposition of the gold as a finely divided black slime upon their surface. After passing the "zinc box," the "exhausted solution," which should not retain more than a trace of gold, flows into a storage tank to be pumped back to the leaching tanks when a fresh charge has to be treated. Very great loss of cyanide takes place by secondary decomposition of the potassium salt, due to the galvanic action of the gold-zinc couple that is formed. The slime of finely divided gold and silver with a large proportion of zinc and lead, and smaller amounts of tin, antimony and accidental impurities after thorough settling is transferred to enamelled iron pans and carefully dried. It is then mixed with sand, borax, and bicarbonate of soda and melted in a crucible yielding a bullion about 650 fine.

In the Molloy process, which is said to be in successful operation in South Africa, the use of zinc is dispensed with altogether. The cyanide solution from the leaching tanks passes through a shallow trough containing mercury, in which is an inner cylindrical vessel filled with solution of carbonate of soda; the edges of the cylinder just dip beneath the mercury so that its contents are entirely cut off from the outer portion of the vessel. A rod of lead dips into the soda solution; the lead and mercury are connected with opposite poles of a battery, and the solution is electrolyzed by the passage of a current. The sodium combines with the mercury to form sodium amalgam which at once decomposes the gold cyanide solution with formation of ordinary gold amalgam, sodium cyanide being simultaneously produced. It is claimed that much less decomposition of the cyanide takes place than with zinc, and moreover that the outflowing solution is better adapted for dissolving fresh quantities of gold. In the ordinary method a large accumulation of zinc in the solution must take place, which in time renders them valueless for gold extraction whereas sodium cyanide is just as effective as the potassium compound.

Turning now to the acid and alkali industries not much of fundamental importance is to be noted in the former. At the Columbian Exposition were shown in the exhibit of Heraeus, of Hanau in Germany, large platinum stills of the Faure and Kessler system, in which the interior of the still was plated throughout with gold. It has been found that this surface of gold will stand the action of concentrated sulphuric acid much longer than one of platinum. I have since seen two such stills in operation in a large chemical works and understand that the claim is thoroughly borne out in practice.

Perhaps the most important matter of interest in connection with the alkali industry, is the attempt now being made by numerous experimenters to accomplish a commercially successful electrolysis of salt solution with chlorine and caustic soda as the products. The results, with

two of the most prominent processes (the Greenwood and the Le Sueur) were summed up some months ago by Messrs. Cross and Bevan, of London, England, and from their article (Jour. Soc. Chem. Ind., 1892, p. 963) we shall quote. The chief difficulties met with were the devising of a diaphragm of such low resistance as would allow the electrolysis to proceed with a reasonable low electro-motive force, and which would at the same time effectually prevent the recombination of the products of electrolyzer; and the construction of an anode which would stand wear and tear. In the Greenwood process, "the electrolysis consists of a rectangular tank of slate or other suitable material divided into compartments by means of diaphragms. These are made of a number of V-shaped shelves of glass or slate placed in a mahogany frame. The spaces between the shelves are filled with asbestos. On one side of the diaphragm is the cathode made of iron and on the other side is the anode. This is of peculiar construction, being built up of a number of pieces, of hard retort carbon cemented together by first impregnating with tar and subsequently heating to a high temperature. The inside is filled with type metal. The cathodes and anodes in every electrolyzer are connected together in parallel circuit, the electrolyzers themselves being in series. Arrangements are made by means of pipes for allowing the salt solution, which is about half-saturated, to flow through all the anode and the cathode sections, respectively. The chlorine which is evolved passes into the chlorine main. The caustic solution after passing through a sufficient number of electrolyzers is evaporated, and the excess of undecomposed salt removed. In the Le Sueur process, the electrolyzers consist of an iron tank fitted with a sloping floor on which rests the cathode. This is formed of a ring of iron filled with several pieces of iron wire gauze. Several small holes are drilled in the top part of the ring to allow of the easy escape of the hydrogen. The diaphragm, which rests upon the cathode, consists of two parts, a sheet of ordinary parchment paper, and a double sheet of asbestos cemented together by means of coagulated blood albumen. The anode consists of pieces of ordinary retort carbon imbedded in a mass of lead through which electrical contact is obtained. In this process the diaphragms have to be renewed every forty-eight hours, and the carbon anodes in from six to eight weeks. When the electrolysis has been continued long enough for the solution of caustic to reach a strength of about ten per cent the liquor is run away, and the alkali precipitated as bicarbonate. The Le Sueur process is now in operation at Rumford Falls, Me., on a scale of three tons of bleach per day. E. Hermite and A. Dubose (Zeitsch. fuer Angew. Chem., 1892, p. 729) claim that all these attempts at simple electrolysis of salt solutions will remain unsatisfactory, because the heat of the combination of sodium and oxygen is less than that of sodium and chlorine, so that a current of sufficient electro-motive force to decompose sodium chloride will also decompose the sodium oxide as fast as formed. Thus the electro-motive force used is practically wasted. They have proposed and patented two methods for preventing this. The first is to cause the sodium oxide in the moment of its formation to enter into combination to

form a sodium salt possessing a higher heat of chemical union than sodium chloride, so that the electro-motive force of the current may remain constant. Such a compound they find in sodium aluminate, which will form if pure gelatinous alumina be present in the salt solution undergoing electrolysis. As soon as all the alkaline chloride is decomposed, the current is stopped, and carbon dioxide is led into the solution when the alumina hydrate is again set free while sodium carbonate is formed. Their other proposal is to use as cathode plates of amalgamated copper or other metal over which a thin layer of mercury is continuously made to pass. As the alkali metal separates out, it is amalgamated, and this sodium amalgam is, by a special device, removed promptly into another receptacle where it is decomposed by water, with the formation of caustic soda solution.

I am not aware that these proposed processes are as yet carried out on a practical scale. Cross and Bevan, however, state that the original Hermite process for the continued electrolysis of magnesium chloride solutions for bleaching purposes is proving highly successful on the continent of Europe, and that it is now replacing 3,000 tons of bleaching powder per annum.

While the two great products sought to be obtained in all of these processes above described are chlorine and caustic soda, it must not be overlooked that these are side products. In the solution will be found hypochlorites and chlorates also. In connection with the Greenwood process it has been proposed to extract the latter salt.

An entirely different utilization has, however, been proposed for weak electrolyzed brine solutions, depending upon the development of hypochlorites therein. I refer to their use as disinfecting agents. The Woolf process, as taken up for experiment by the New York City Board of Health, proposes to disinfect large quantities of liquid sewage by adding to it weak electrolyzed brine solutions, and it is stated by Dr. Cyrus S. Edson to have accomplished very remarkable results in the experiments made under his direction in New York.

In the class of nitrated mixtures for explosive purposes there has been much published and patented in the last few years. The improvements have been mainly in two lines, viz.: smokeless powders and high explosives which combine safety of transport and handling with great energy of decomposition. The former are largely mixtures of nitro-cellulose and nitro-lignin (both soluble and insoluble varieties) with alkaline or alkaline-earth nitrates. A very interesting series of analyses of such smokeless powders, by Prof. C. E. Munroe, formerly of the United States Naval Torpedo Station, at Newport, will be found in the January number of the Jour. of the Am. Chem. Society. The second class include mainly mixtures of substances very rich in oxygen, whether solid or liquid, and highly condensed carbon compounds. To these belong the series of Sprengel explosives, rack-a-rock (chlorate of potash and nitrobenzene) and similar compounds. These can be mixed frequently on the spot just before use, and so safety of transport insured as the compounds taken singly are inexpensive or in some cases peculiar detonating fuses are needed to develop their explosive power.

Very great interest has attached in recent years to the discovery of large and valuable deposits of native phosphates of value in the manufacture of fertilizers, but as a special lecture on this subject by a gentleman who has had exceptional opportunities of studying these deposits, will follow later in the course, I will leave the matter, feeling that it will be thoroughly discussed at that time. Similarly the cement industry and especially the manufacture of Portland cement, which has made great advances in the United States in the last few years, will be left for a special lecturer to follow later in the winter, a gentleman engaged himself in the manufacture of cement, and by the newest and most improved methods. A lecture is also down on our list on the subject of "Emery and other Abrasives." In this will doubtless be mentioned the very interesting new compound, known by the trade name of "Carborundum." By heating together a mixture of 100 parts of sand, twenty-five parts of salt and twenty-five parts coke in an electrical furnace for several hours is formed along with graphite a new and interesting chemical compound SiC (silicon carbide), to which the trade name of "Carborundum" has been given. This forms crystals of a greenish-gray color of the hexagonal system, of specific gravity 3.22, and of a hardness little if any inferior to the diamond. A full account of the discovery and properties of this interesting compound by the discoverer, Mr. Ed. G. Acheson, will be found in the September and October numbers of the Jour. of the Franklin Institute.

Turning now to the organic side of Chemical Technology, and beginning with the subject of petroleum and mineral oils, we may notice the interesting results of Professor Engler, of Karlsruhe, of which he presented a brief abstract in a paper read before the Chemical Congress at Chicago, in August last. He finds that almost all the animal fats and fatty oils when distilled under strong pressure yield hydrocarbons of the paraffin series. Besides the oil some water and combustible gas was always formed. By fractional distillation the oils yielded gasoline, benzene, illuminating and lubricating oils and even paraffine wax. Samples of all these prepared from train oil were shown in connection with the reading of his paper. The bearing of all this on our theories of the formation of petroleum is very important. Many prominent geologists have expressed the view that the origin of petroleum was to be sought in marine animal life, of which we find the mineral remains in the oil-bearing strata. Engler first distilled quantities of salt-water fishes and shells under strong pressure, but only obtained a mixture of nitrogenous bases, such as pyridine, bearing no relation to petroleum. But, as before said, the results were very different with train and fish oils. He therefore believes that while the easily decomposable nitrogenous material of marine animal life has disappeared, the accumulated fatty oils and blubber under the pressure of sedimentary strata, and aided perhaps by heat, have undergone destructive distillation with petroleum as the main products.

A new class of products of considerable practical interest derived from the class of semi-drying oils, like cotton-seed and rapeseed oils, is that known as "blown oils." These are produced by heating the

oils to a temperature of about 230° C. for some hours while a current of air is forced through them by a blowing machine. The changes effected are quite marked. Thus, while common cotton-seed oil has a specific gravity of 0.925 and a very moderate viscosity, after the blowing operation is complete its specific gravity is raised to 0.960 and the viscosity is raised in an extraordinary degree. Moreover the thorough oxidation thus effected has improved its character as an ingredient in lubricating oils in other respects. It is no longer liable to acidity when used as a lubricant, and so is especially adapted for mixing with paraffin oils for the manufacture of the best heavy lubricating oils. Numerous other uses have also been found for these blown oils, such as the manufacture of artificial leather and other products.

In the domain of the essential oils, very important discoveries have been made in the identification of the essential odoriferous constituents of several of the essential oils and the consequent synthetic preparation of these constituents. It has been established that the esters of certain alcohols of the composition $\text{C}_{10}\text{H}_{18}\text{O}$ and $\text{C}_{10}\text{H}_{16}\text{O}$ are the principal constituents of a large number of essential oils which owe their aroma in the main to the esters in question. Thus, for instance, linalyl-acetate and other esters of linalool, $\text{C}_{10}\text{H}_{18}\text{O}$, have been recognized as constituents of lavender oil, bergamot oil and petitgrain oil, while geranium oil, lavender oil and lemon-grass oil contain esters of geraniol, $\text{C}_{10}\text{H}_{18}\text{O}$, principally geranyl-acetate. In pine oils finally esters of borneol, $\text{C}_{10}\text{H}_{16}\text{O}$, have been found. It is similarly found that ethyl, $\text{C}_{10}\text{H}_{16}\text{O}$, the aldehyde of geraniol is the main constituent of oil of lemon and that rhodinol, $\text{C}_{10}\text{H}_{16}\text{O}$, is the fluid constituent of oil of rose. All of these compounds of definite composition are now prepared in a pure state and are coming into use in the perfumery trade as much more reliable than the natural oils themselves.

Another interesting class of products closely related to those just spoken of are the so-called "ester-gums," recently offered to the varnish trade as substitutes for copal, dammar, mastic, sandarac and other natural varnish gums. These ester gums are the glyceryl, methyl and ethyl esters of abietic and pinic acids and are prepared by saponifying ordinary colophony resin (or common rosin) under pressure and then freeing the ester so formed from water, etc., by distillation in vacuo. The artificial gums so obtained are soluble in all the varnish-forming solvents and form varnish films of great brilliancy and durability.

In a lecture which I delivered here in January, 1892, I spoke of the chemistry of starch and the decomposition products obtained from it under the influence of the diastase of malt. The importance of the industries based upon starch and its alteration products makes this a subject of practical as well as theoretical interest. Dr. Lintner, of Munich, has recently published the results of studies made by him on this action of diastase. He considers the existence of the complicated dextrine molecules of high molecular weight, described by Brown and Morris (an account of which was given in the lecture before referred to) as very unlikely. By the aid of phenyl-hydrazine as reagent, Lintner established the pres-

ence of isomaltose as an invariable ingredient in the product of the diastatic action. By the use of four different methods of study, viz., the determination of specific rotatory power, the reducing power of Fehling's solution, the molecular weight determination, according to Raoult's method, and the addition of phenyl-hydrazine as reagent, Lintner determines that five well-characterized products can be obtained from the action of diastase on starch. These are the three dextrines already known under the names of amylo-dextrine, erythro-dextrine, and achroo-dextrine, isomaltose and maltose. Supported upon the results of the molecular weight determination, Lintner gives to amylo-dextrine the formula $(\text{C}_{12}\text{H}_{22}\text{O}_{11})_n$; to erythro-dextrine the formula $(\text{C}_{12}\text{H}_{22}\text{O}_{11})_m$, and to achroo-dextrine $(\text{C}_{12}\text{H}_{22}\text{O}_{11})_k$. Brown and Morris' complex dextrines he considers to have been mixtures of these simpler dextrines with either isomaltose or maltose, as all five products of the diastatic action may exist together in the infusion at the same time.

The chemistry of cellulose and its derivatives has attracted the attention of many experimenters. Among the most important results have been those of Cross and Bevan on the new forms of cellulose obtained from what they term cellulose sodium xanthate. This is formed by treating the cellulose with a concentrated solution of sodium hydrate, and exposing this product to the action of carbon disulphide vapor. Action ensues, and in the course of an hour or two a yellowish mass is obtained, which swells up enormously on treatment with water, and finally dissolves completely. This crude solution containing yellow bye-products, yields the cellulose derivative in a pure state on treating it with saturated brine or with strong alcohol. These precipitate it either in a flocculent condition or in leathery masses which may be washed with sodium chloride solution or 65 per cent alcohol, respectively. On re-dissolving in water, an almost colorless solution of extraordinary viscosity is obtained. A 7 per cent solution of the compound, i. e., containing (say) 5 per cent of cellulose to 100 of water has a viscosity equal to that of glycerine measured by the rate of flow. The solutions of this cellulose-sodium xanthate undergo decomposition, however, spontaneously after a time, more rapidly by heating or the addition of reagents. There separates out then a firm coagulum of hydrated cellulose, easily capable of purifying by simple washing with water. The spontaneous gelatinization of the solutions appears to take place without change of volume, the coagulum invariably reproducing the details of the surface of the containing vessel. Shrinkage then ensues, the form of the coagulum being perfectly retained. Solutions exceeding 10 per cent strength (in cellulose) give a coagulum of great solidity; even when diluted to 0.5 per cent strength the cellulose jelly obtained has sufficient consistency to be handled. Among the many applications of the solution or of the pure cellulose separating from it, may be mentioned the following, which have been pointed out by the authors:

1. As an adhesive substance, replacing glue, flour paste, gums, india rubber solution, etc.
2. For sizing and filling textiles. In this

direction the important advantage of depositing a substance of the same chemical composition and physical properties of the textile does not need to be insisted upon. The authors in this way have introduced from 15 to 30 per cent of additional cellulose without the possibility of its presence being appreciated except by comparison with the unfilled fabric.

3. For purposes of producing casts and molds. By coating surfaces with the solution or filling hollow vessels, perfect reproduction of form and structural details can be obtained in the form of a more or less solid mass of cellulose hydrate. The cellulose when fully dehydrated by drying, forms a transparent mass, resembling horn, which can be worked in the lathe, taking a brilliant surface under cutting and polishing tools.

4. The applications of the various forms of the solid cellulose in block or film form are evident to any one who has followed the utilizations of celluloid or nitro-cellulose, over which this has the advantage of lack of dangerous inflammability.

One of the industries in which great changes have been made in the last few years, owing to the introduction of new chemical processes, is the tanning and leather industry. While the tanning of heavy leather has been improved by the widespread introduction of oak and hemlock bark extracts of definite and uniform composition, it is in the tanning of lighter leathers, such as calf and kid, that the greatest advances have been made. For these, the "dongola" tanning and the newer "chrome" or mineral tanning processes have almost entirely displaced older methods. The dongola process is a combination process using gambier, alum and salt together in the same liquid and following the tanning proper by a treatment of the leather with "fat liquor," or oil emulsified with borax or soda solution.

It is, however, the successful introduction of the mineral tanning processes which is now revolutionizing the manufacture of lighter leathers in this country. The process generally in use at present involves treating the skins at first with a weak solution of bichromate of potash, to which sufficient hydrochloric acid is added to liberate the chromic acid. After the skins have taken up a bright yellow color through their entire texture, they are drained and transferred to a bath of hyposulphite of soda, to which some acid is added to liberate sulphurous acid, which reduces the chromic acid to green chrome oxide, while the sulphurous acid is at the same time oxidized to sulphuric acid, which liberates a further portion of sulphurous acid until the whole of the chromic acid is reduced. The leather so produced is of a pale bluish-green color, tough and flexible, and thoroughly resistant to water. Indeed, it is this latter property which distinguishes it from all other forms of leather, as the combination of the hide fiber or corium with the chromium oxide is apparently more stable than its combination with tannin, and yields less to boiling water. The leather also can be dyed and produced in a variety of colors, but the dyeing must be done before the leather dries, as its water-repellent character is such that once dried it cannot be wetted sufficiently to take up a full color. The process is now carried out in this city at several

morocco tanneries on a very large scale, and with perfectly satisfactory results.

Chrome-tanning processes involving the use of chrome alum and other salts of the sesquioxide of chromium as the basis of the tanning vat have been used, but apparently the combination does not take place so readily as where the chromium oxide is obtained in statu nascendi by reduction from the bichromate under the influence of reducing agents. Basic chromium salts have also been recently proposed as mineral tanning agents, but of their practical success I cannot speak from personal knowledge. That mineral tanned leather has taken a strong hold upon the industry was made evident by the many and fine exhibits of such leather at the recent Columbian Exposition, and can also be gathered from the testimony of foreign experts who visited this country during the past summer. Prof. Henry Procter, of the Yorkshire College, Leeds, England, in a lecture delivered since his return, says of the chrome process that "it may be said to be the most striking new departure in tanning which has taken place within my memory."

With this brief and partial survey of the field I will conclude, simply drawing attention to the fact that we will have the pleasure this winter, in our course of lectures, of hearing several of their subjects taken up in detail by eminent specialists.

ELIXIRS OF CHLORIDES.

The Indiana Pharmacist comments upon the fad for the combining of chlorides or iodides into certain preparations, as elixirs, and offers a few formulas for those most called for with a little modification and substitution of the iodide for the chloride the elixirs of the iodides can be made in the same manner).

ELIXIR ONE CHLORIDE.

- Corrosive sublimate 2 grains.
- Water 8 ounces.
- Syrup orange 8 ounces.
- Dose—Teaspoonful after each meal.

ELIXIR TWO CHLORIDES.

- Tincture chloride of iron, 1 ounce.
- Solution chloride of arsenic 2 drams.
- Simple syrup, to make.... 16 ounces.
- Dose—Teaspoonful after each meal.

ELIXIR THREE CHLORIDES.

- Corrosive sublimate..... 3 grains.
- Chloride of ammonia..... 2 ounces.
- Solution of chloride of arsenic 3 drams.
- Simple syrup, to make.... 16 ounces.
- Dose—Teaspoonful after each meal.

ELIXIR FOUR CHLORIDES.

- Corrosive sublimate 4 grains.
- Solution chloride of arsenic 3 drams.
- Hydrochloric acid, dilute. 4 drams.
- Tincture chloride of iron... 8 drams.
- Simple syrup to make.... 16 ounces.

ELIXIR FIVE CHLORIDES.

- Corrosive sublimate 3 grains.
- Solution chloride of arsenic 3 drams.
- Hydrochloric acid, dilute... 3 ounces.
- Tincture iron chloride.... 3 ounces.
- Ammonia chloride 3 ounces.
- Simple syrup, to make.... 16 ounces.
- Dose—Teaspoonful after each meal.

There are 4,781 distilleries in the United States, with New York at the head, closely followed by Pennsylvania and Illinois.

PHARMACY.

QUININE has found new application in the treatment of infected wounds. In antiseptic properties it is considered superior by some to corrosive sublimate or iodoform, and it is claimed that when applied in 1 per cent solution, healing takes with surprising rapidity. This seems but a logical application, and one which has been several times predicted.

DEPLATORY.—Apply with a brush once daily, for three or four days, a colloid to one ounce of which has been added twelve grains iodine, twenty minims castor oil, two and a half drams absolute alcohol. Upon removal of the colloid film from the skin, the hairs will come away.

EFFECTIVE BACTERICIDES.—It has been demonstrated that corrosive sublimate is inferior in its germ destroying power to Javelle water, hydrogen peroxide, and chloride of lime. These substances are most efficient when in hot solution and in the case of solution of chloride of lime it is found to be most powerful when diluted with 10 or 20 times its volume of water.

CHEMISTRY AND READING NOTICES.—Medical Record calls attention to the fact that the Lancet has equipped a laboratory, and everything is a-rist to the scientific mill therein. The Lancet publishes analyses of champagne, lager beer, bon-bons, malt, wine, tea, gin, etc., and the Record states that, curiously enough, everything analyzed and reported upon is found to be good, so that the state of mind of the Lancet's chemist is very suggestive of that described in Genesis at the end of creative work.

SUMMER COMPLAINT.—The following prescription make fresh every second day and kept in a cool place is recommended for administration in teaspoonful doses before feeding for infants 1 year old and one-half the dose for infants 6 months of age:

- Hydrochloric acid, dilute 16 minims.
- Pepsin, pure 1 dram.
- Bismuth subnitrate 2 drams.
- Syrup 2 fl. drams.
- Distilled water 16 fl. drams.

Shake the bottle before using.

RAPIDITY OF FLASH-LIGHT.—For the purpose of photographing projectiles while in rapid flight, it is necessary to have some method of illumination more rapid than the electric spark, and a new apparatus has been devised for this purpose. It consists of a mirror of steel about one inch in diameter, which is made to revolve at the rate of 1,000 times a second. The beam of light passes from this mirror across a screen at such a rate that it enables photographs to be taken in about one-tenth millionth of a second.

- SUMMER DIARRHOEA OF NURSING INFANTS.**—Toussaint (Gaz. de Hap., Med. Quar.) obtains excellent results from the use of the following mixture in summer diarrhoea in nursing infants:
 - Papain, pure 9 grains.
 - Lactic acid ½ dram.
 - Simple syrup 1½ fl. ounces.
 - Distilled water 5 fl. ounces.
 - Tincture vanilla, sufficient.

The milk given to the infant is to be limited in quantity and the intervals between feeding lengthened. After each nursing a large teaspoonful of the mixture is to be given.

THE CONGREGATE "REMEDY" FOR CONSUMPTION. This name (says N. Y. Med. J.) brings to mind those quackish "God-provided remedies," advertisements of which are almost constantly to be seen in the religious newspapers of Great Britain. Within the past year, we understand, a Congregate branch has been started in the United States, and falsely flattering advertisements have begun to crop out in our own religious journals. A published analysis tends to show that the Congregate medicines consist of an infusion of elderberries with Friar's balsam.

PARABROMTHYMOL is prepared, says G. Plancher (Gaz. Chim., Merck's Market Rep.) by dissolving 25 parts of well-dried thymol in 50 parts glacial acetic acid. The solution is cooled by being placed in cold water and then is mixed drop by drop with a solution of 25 parts each of bromine and glacial acetic acid. Then there are added 21 parts of water and a small crystal of bromothymol, when the parabromthymol will separate out in crystals. This is dissolved in soda solution, filtered, and the parabromthymol then separated by means of dilute sulphuric acid. Twenty-nine parts of product are obtained. Parabromthymol melts at from 52° to 53° C.

TO KEEP ANTS AWAY.—Rub a light film of balsam Peru around near the bottom of table or kitchen safe legs—just a narrow band will do—and renew the balsam every two or three weeks (Sci. Amer.). This will keep ants away from tables, kitchen safes, etc., and what they hold or contain, provided there is no other ant way than up the legs. One drop of balsam Peru spread around the upper part of a syrup bottle will keep the ants away for months. Boil one ounce of balsam Peru in one gallon of rain water for half an hour and sponge this water while hot over wooden floors and walls, and it will keep ants away for a long time.

DYSPEPSIA OF NURSING INFANTS.—Mathews' Medical Quarterly quotes from foreign source the following prescriptions, the object in view being to render the contents of the stomach more acid and to facilitate coagulation of the milk in the stomach:

- (1.) Hydrochloric acid..... 30 minims.
 Water 3 fl. ounces.
 Simple syrup 2½ fl. ounces.
 A teaspoonful a quarter of an hour after nursing.
- (2.) Lactic acid 15 minims.
 Hydrochloric acid 15 minims.
 Water 3 fl. ounces.
 Simple syrup 2½ fl. ounces.
 At the same time boiled or sterilized water should be used.

MEDICAL ENDORSEMENT OF SECRET REMEDIES.—Our contemporary, the Pacific Druggist, quotes from the Medical Review, published in St. Louis, some thirty-eight prescriptions manifestly intended as a guide and help to the busy practitioner in the selection of remedies for the various ailments indicated by the head lines. Every one of these thirty-eight prescriptions calls for either a patent medicine, a special formula, or preparation of some particular house, and not one of the formulas can be put up by the most competent chemist unless he buys a ready-made preparation from some manufacturing concern. The ad-

vertising pages of the medical journal in which they are published disclose advertisements of articles called for in twenty-seven of the formulas. The commentator makes some very pertinent remarks upon this singular coincidence and goes on to speak of reading notices in medical journals in not particularly flattering terms. It is to be regretted that our contemporary does not call by name a great many other medical journals which are pursuing the same course.

TOXICITY OF THE URINE OF LEPROUS.—La Reforma medica publishes an account of some experimental researches undertaken by Dr. Vicenzo Fislchello in the general pathological laboratory of Catania. The following is an epitome of the results (Br. & Col. Dr.): "1. The urine of patients affected with tuberculous leprosy is more poisonous than normal urine. 2. The degree of toxicity of this urine is in direct ratio with the gravity of the disease and the length of its duration. 3. The succession of morbid symptoms is the same as that observed when a larger quantity of normal urine is employed. 4. It is impossible to determine the exact amount of leprosy urine required to kill an animal (at so much per kilogramme of the animal's weight) on account of the different stages of the malady, and the individual sensitiveness of the rabbits, which is far from being alike, one with another. 5. If by the employment of the method of Professor Ferrarri a cure of leprosy is accomplished, the toxicity of the urine diminishes, and it returns to its normal standard."

PHENOCOLL HYDROCHLORATE is incompatible with alkalies and alkaline carbonates. Other incompatibilities are stated by George Roe as follows: With chloral hydrate it turns darker; with the acetate, bicarbonate, bromide, citrate and sulphate of potassium and benzoates or alum the mixture becomes solid; with compound tincture of cinchona or decoction of cinchona a precipitate is produced; with solution of mercuric chloride a white precipitate is thrown down; with dilute nitric and nitrohydrochloric acids it changes to a red color and deposits a large quantity of crystals. It has been prescribed with piperazin, with which, however, it becomes solid when prescribed in large doses, a difficulty which can be overcome by dispensing in small doses, thus:

- Piperazin 5 grains.
 Phenocoll hydrochlorate, 10 grains.
 Distilled water 2 fl. ounces.
 Each salt should be dissolved in one-half the water and the solutions mixed. Double the dose here given produces a decidedly incompatible mixture. With piperazin and phenocoll hydrochlorate it appears that they can be dispensed together in the ratio of 10 of the former to 15 of the latter, if some tincture, say orange, be added.

SOMATOSE is a yellowish, fine granular powder, perfectly odorless and practically tasteless. It is readily soluble in water and aqueous fluids. From this solution the albumins are precipitated by dilute acids, but redissolved by an excess of acid. When heated the aqueous solution gives no precipitate. Tannic acid, chloride of iron, sulphosalicylic acid, ferrocyanide of potassium and acetic acid give the well known reactions. The buret reaction as might be imagined, is very

marked, with a bluish color. Being a preparation of meat, somatose contains those constituents of the latter which possess nutritive value. The glutinous pepton, says Times & Register, which readily forms during peptonization of the collagenous material in muscle, is eliminated from somatose. Besides this pepton, the nitrogenous bases of meat (creatine, xanthine, etc.) are removed, but this is of no importance since these substances pass through the system unchanged, and, therefore, have no nutritive value whatever, and, at the most, may be considered as delicacies. Somatose contains no nitrogenous extractive and no fat.

INTRODUCTION OF NEW REMEDIES.—The Compulse prints a very interesting communication from Dr. S. L. Weber upon the subject of the introduction of new remedies. He sums up his statements by offering the following as the steps necessary to properly place the worthiness of a new remedy before the bulk of the profession, those who have not the time or knowledge to determine for themselves the merit of a new drug.

1. The discovery. This may be accidental, as in the case of cocaine; it may be deliberate from a knowledge of the relation of chemical structure to physiological action—as was the discovery of amyl nitrite, and, more recently, that of phenacetine; it may be the result of a deliberate search through the myriads of chemical compounds for one that should have the therapeutic effect sought for—such as resulted in the discovery of many internal antiseptics, of acetanilid and of many recent hypnotics; it may be the result of physiological experiments with newly obtained chemical combinations—such as given us apomorphine; or it may be entirely empirical and without any scientific method, such as introduced most all of the remedies until recently.

2. The announcement of the discovery, in a legitimate manner, by writing a paper upon it, giving fully all known information as to the origin, method of preparation, composition, pharmacology, chemistry, structural formula, etc., together with all experiments that led the author to form his opinions of the therapeutic value of the remedy.

3. The verification of the new remedy by a large number of competent men.

4. If found of value by these, the publication of their results in standard medical journals.

5. The spreading of the good news in current medical literature, by reviews and editorials of these journal articles and in medical societies by papers and discussions.

When the above steps have been complied with, and they always are if there is any virtue in the proposed new remedy, then, and not till then, should the rank and file of the profession use it. There is no other legitimate and scientific way of introducing a remedy to the medical profession.

Soap is being used instead of cream by the confectioners of Paris in the manufacture of cream cakes, charlotte russe, etc., and no one ever knows the difference. A quantity of the soap, dissolved in hot water is beaten to a stiff foam and then sweetened and flavored. The Paris Board of Health has ordered the practice to be stopped.

EXAMINATION QUESTIONS.

This Department is for the publication of questions and answers for our readers; the OBJECT being to place before them questions for self-examination and to indicate the directions in which study can be profitably carried on.

We **Solicit** questions to which replies are desired, particularly questions suggested by personal experience and study.

Correct Answers to the questions in each series will be published in a subsequent issue of the paper, as announced, together with the NAMES of all persons sending us correct replies.

Write the **Number** of the series at the top of your reply and write on one side of sheet only.

Address—EDITOR PHARMACEUTICAL ERA, Box 583, Detroit, Mich.

SERIES NO. 1.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 1st issue. Replies should reach us not later than March 15th, 1894.

1. Give meaning of the term evaporate, and state the difference between evaporation and distillation.
2. What is the difference between a sediment and a precipitate.
3. Give the official fluid or liquid measures, their abbreviations, and their equivalents in minims. (By "official" is understood U. S. P.)
4. What is the official thermometer? Why is mercury especially adapted for use in thermometers? Convert—10° R. into degrees temperature official standard.
5. Write a prescription for a four-ounce emulsion containing 25 per cent of castor oil. Give all the ingredients to make an agreeable and homogeneous mixture, with directions for compounding.
6. What significance is attached to the terminations ate and its in the nomenclature of salts?
7. Define fermentation. What is a ferment? Give examples (pharmacopoeial) of the products of fermentation.
8. How would you distinguish between morphine and quinine? Between corrosive sublimate and calomel?
9. Two ounces of distilled water at 15° C. will dissolve how many grains of each of the following? Potassium chlorate? Boric acid? Epsom salt?
10. State the difference between annual, biennial and perennial plants, and give an example of each.

SERIES NO. 2.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our April 15th issue. Replies should reach us not later than April 1st, 1894.

1. In the nomenclature of the Pharmacopoeia how are the titles of substances expressed?
2. What is effervescence? Deliquescent? Name two pharmacopoeial salts which effervesce. Two which are deliquescent.
3. Outline the official process for making syrup of wild cherry. Why is this process used? Upon what constituent does the virtue of this preparation depend? Why is glycerine used in the preparation?
4. Give the official title and the common and maximum doses of Kermes mineral, mercuric chloride, African pepper, tincture of opium, tincture of digitalis, tincture cantharides. Which are toxic, and what are the antidotes?
5. Belladonna. Give the botanical

name. Common name. Country indigenous to. What part is used? When should it be collected? What is the active principle? What is the dose of the powdered leaves? Of the principal alkaloid? Name antidote for belladonna poisoning. Name the official preparations of belladonna.

6. What do you understand by a poison? An antidote? A dose?
7. Write correctly in Latin, without abbreviation, and state the quantities of each ingredient, a formula to make one pint of an elixir, of which each fluid dram is to contain 1 grain of quinine, 1-100 grain strychnine, and 2 grains phosphate of iron.
8. Write an equation showing the reaction which occurs in the preparation of syrup iodide of iron by the official process. Spirit Mindererus. Hydrated Alumina.
9. What is the difference between a hydrocarbon and a carbohydrate? Give an example of each.
10. What is an essential oil? Name several official ones, and state their properties and dose. How would you detect the addition of alcohol to an essential oil?

SERIES NO. 3.

Correct answers to these questions, together with the names of all persons answering correctly eight or more of them, will be published in our May 1st issue. Replies should reach us not later than April 15th, 1894.

1. In what proportion must two quantities of powdered opium, containing 13.5 and 16 per cent of morphine respectively be mixed to produce 8 ounces of opium containing 14 per cent of morphine?
2. A quantity of official sulphuric acid weighs 45 grams. How many cubic centimeters does it measure? A quantity of official nitric acid measures 25 cubic centimeters. How much does it weigh in grams? In grains?
3. How would you distinguish between a root and an underground stem?
4. Which contains the larger percentage of alcohol; a solution made from equal parts by weight of alcohol and water, or one made from equal parts by measure of alcohol and water?
5. What is the percentage of bromine and how many grains of bromine are there in one ounce of potassium bromide?
8. What is an alum, chemically considered? Write the chemical symbols for two alums not containing aluminum. Name the pharmacopoeial and other varieties of alum.
7. Complete the following chemical equations:
 $Ag + HNO_3 =$
 $FeSO_4 + NaHCO_3 =$
 $KOH + I =$
8. What is meant by the following prefixes used in the nomenclature of salts: Mono, bi, bin, tri, quadri, di, bis, ter, tetra, super, hyper, per, sesqui, sub, hypo, proto, ortho, meta, pyro, para.
9. What are the chemical differences between red and yellow oxides of mercury? Give the chemical formula for each.
10. Which contains the more quinine (alkaloid), quinine bisulphate or quinine sulphate? Give the percentage of quinine in each salt and exhibit the figures used in your calculations.

Formulas Wanted.

(H. W.) "Fritt's Mixture."
 (C. D. K.) "Checini's Electric Spavin Cure."

FORMULARY AND QUESTION BOX.

The object of this department is to furnish our subscribers with reliable and tried formulas and to discuss questions relating to practical pharmacy, prescription work, dispensing difficulties, etc.

Requests for information are not acknowledged by mail and **ANSWERS COMMUNICATIONS RECEIVE NO ATTENTION.** To insure answer in the next number, queries should be in our hands *ten days* prior to the date of issue.

(Anonymous.) If K. K. will send his name and address his query will receive attention. See instructions at the head of this department.

5945. Palatable Castor Oil.

(Oneida.) W. H. Nelson, Filley, Neb., says that castor oil may be rendered palatable by simply shaking it with an equal quantity of aromatic syrup of rhubarb. It is easily dispensed and he thinks it makes a better preparation than any of the processes outlined.

5987. Tooth Paste for Collapsible Tubes.

(W. A.) See reply to query No. 5946, February 1st Era, page 110.

5988. To Remove Printers' Ink From Fabrics.

(W. E. M.) Sponge with ether or pure benzine. Oil of turpentine will also have a similar effect.

5989. Remington's Pharmacy.

(H. T. F.) The author of this work informs us that he is busily working upon a revision of it to make it conform with the 1890 Pharmacopoeia and hopes to have it in publication very shortly. We cannot give you, however, the exact date when it may be expected.

5990. Healing Ointment.

(T. B. & S.) An ointment said to resemble the one you name may be made by the following formula:

- Precipitated sulphur..... 2 parts.
- Tallow 3 parts.
- Lard 3 parts.

5991. Atfield's Chemistry.

(A. W. P.) The last or twelfth edition of this work made its appearance a few years ago before the advent of the present United States Pharmacopoeia. We understand that a new edition is under way and doubtless it will make its appearance before very long.

5992. Curious Ointment.

(N. T. W.) had no difficulty in compounding the following prescription:

- Gum euphorbat..... 1 ounce.
- Powder cantharidis..... 1 ounce.
- Merc's curious ointment 2 ounces.
- Cororr. supiment..... 1½ ounces.
- Lard 1 ounce.

Micks.
 Our correspondent inquires, however, if Merck manufactures the third ingredient in the prescription.

5993. Ants Around the Soda Fountain.

(C. D. J.) Make a powder composed of equal parts of cane sugar and tartar emetic into a thick paste with glycerine, and distribute small particles where the ants can get at it. Another scheme, recommended as a preventive for the inroads of ants, is a strip of carbolated petrolatum about half an inch in width drawn about the places frequented.

5904. Ointment Boroglyceride.

(C. A. R.) The Era Formulary gives this:

Boroglyceride 30 parts.
Glycerine 20 parts.
White wax 10 parts.
Petrolatum 60 parts.

Melt the boroglyceride with the glycerine, and add the wax previously melted with the petrolatum; stir until cold.

5905. Dental Anesthetics.

(G. E.) Last year the Era published considerable upon this subject, the preparation you name being one of those receiving consideration. See the following issues of the Era for 1893: January 15, page 61; March 1, page 205; April 15, page 351; October 1, page 298, and December 15,

5906. Liver Regulator.

(H. W. S.) Kilner is authority for the following:

Liverwort 1 ounce.
Leptandra 1 ounce.
Serpentaria 1 ounce.
Water 2½ pints.
Whiskey ½ pint.

Bring the water to a boil, and pour over the drugs; let stand 1 day, add the whiskey and strain.

5907. Numbering Machines.

(A. W. 19) There are several such machines on the market. We have been using one known as the Bates Numbering Machine in this office and have found it very serviceable in the various kinds of work where such a machine is necessary. This machine will print numbers in duplicate, changing automatically after producing each set, and will also print consecutive numbers or repeat the same number indefinitely. Whitall, Tatum & Co. are selling it, and may be addressed at 410 Race street, Philadelphia, Pa.

5908. Books on Poultry.

(A. W. P.) The most comprehensive book that we know of is Wright's "Practical Poultry Keeper." It is a very complete and a standard guide on the management of poultry either for domestic use, the markets or exhibition; price \$2. You will also be able to find considerable information upon the subject in Jennings' "Swine, Sheep and Poultry." This book treats on the subject of breeding, management, disease, etc. Price \$1.25.

5909. Books on Veterinary Surgery and Practice.

(A. W. P.) The following books upon the subject are recommended by various veterinarians: Courtney, "Manual of Veterinary Medicine and Surgery," price \$3.50; Fleming, "Operative Veterinary Surgery" part 1., price \$3.50. This is a very practical work and is devoted to the common operations of veterinary surgery. A second volume is expected very soon. Gresswell, "Manual on the Theory and Practice of Equine Medicine," price \$3.50, and Williams' "Principles and Practice of Veterinary Surgery," price \$4.50, are also both good books. Any or all of these books may be obtained from this office.

6000. Myrtle Wax.

(W. D.) is a solid vegetable fat obtained by pressure from the berries of the wax-myrtle or bayberry (*Myrica cerifera*), an indigenous shrub growing along the shores of the Great Lakes and the Atlantic coast of North America. The wax has a

balsamic odor, is harder and more brittle than beeswax, varies in color between green, yellowish and gray, and breaks with a shallow conchoidal fracture. It has a specific gravity of 1.065 at 15° C., and fuses at 45 to 46° C. It is used as a substitute for beeswax and particularly in candle making.

6001. Liquid Bluing That Will Not Freeze.

(Laundry.) So far as we are aware there is nothing which can be added to a liquid bluing to prevent its freezing. Glycerine naturally suggests itself, but it is a question whether such an addition would be desirable. The increase in cost with glycerine added would seem to far exceed the expense of the small amount of care necessary to protect the bluing from freezing. We would like the opinion of our readers upon this subject.

6002. Foam for Hair Tonic.

(M. H. K.) The readiest agent to produce a good lather upon the hair of the head is a solution of potassa or soda or a dilute water of ammonia. The latter, however, owing to its penetrating odor is not usually liked. As you have not seen fit to enlighten us as to the composition of your preparation, we cannot say whether the addition of either of the substances named would be admissible or not. Other saponaceous substances like solution of soap, tincture of soap bark, etc., either singly or in combination, are also suggested.

6003. Non-Alcoholic Calentula.

(I. H. K.) A preparation of calentula which represents all the water soluble constituents of the drug may be made as follows:

Calentula (flowering herb) in No. 40 powder 16 fl. ounces.
Alcohol, a sufficiency... 1 part.
Water, a sufficiency... 2 parts.
Glycerine 8 fl. ounces.

Moisten the drugs with a sufficient amount of the menstruum and allow to macerate in a percolator for 12 hours; then percolate to exhaustion with the menstruum, recovering the alcohol by distillation, and evaporate the remaining solution to 8 fluid ounces, finally adding the glycerine and mixing thoroughly.

6004. Balsam of Fir and Spirit Nitrous Ether in a Prescription.

(L. E. H.) Criticism is asked upon this prescription:

Balsam fir..... 1 ounce.
Camphor gum..... 2 drams.
Oil of turpentine..... 2 drams.
Spirit nitrous ether,
enough to make..... 4 ounces.

The color changes you have observed in compounding this prescription are due to the decomposition of the spirit of nitrous ether in combination with the balsam of fir. The mixture changes through the various shades of color, from a pale, light green to a deep red. This change is accompanied by the evolution of gas and the formation of nitrogen compounds of variable composition.

6005. Extract Viburnum Compound.

(C. A. D.) There are any number of formulas for preparations similar to that you name. Besides referring you to formula No. 107 in the National Formulary we append this one:

Ground cramp bark..... 1 ounce.

Scullcap ½ ounce.
Wild yam 1 ounce.
Ground clover 1 ounce.
Ground cinnamon..... 1 ounce.

Mix and macerate in 12 ounces of 76 per cent alcohol from one to three days, then filter and add enough tincture of cinnamon to make 16 ounces.

6006. Syrup Ferrous Iodide and Potassium Iodide in a Prescription.

(W. M. H.) says in mixing a solution of 2 ounces of potassium iodide in 2 ounces of water with 2 ounces of syrup iodide of iron he obtained a solution which became green colored. He wants to know the cause of it. We doubt very much whether our correspondent used a syrup iodide of iron conforming to the standard and tests of the pharmacopoeial preparation. If he had, and had also used potassium iodide conforming to the pharmacopoeial standard, in distilled water, he would have observed no change of color in the liquids when mixed. The mixture should be of a greenish color. So should the syrup iodide of iron.

6007. Formulary for Druggists.

(I. P.) We know of no better work than the Era Formulary. This book contains 5,000 formulas and furnishes a collection covering those branches of work which pertain to both the professional and mercantile calling of pharmacy. A great number of the formulas are original contributions to these columns and were devised by practical and experienced pharmacists. It also contains many new and tried formulas never before published in addition to those selected from other authoritative sources, including standard authorities in the French and German, as well as a great variety of English publications. Of course, there are many other formula books, good ones, too, along special lines, but as a rule such books are not available to the average druggist. Of the books containing formulas designed for the druggist's use, most of them contain either all or in part the formulas and processes of the Pharmacopoeia and the National Formulary. These formulas have been intentionally omitted from the Era Formulary, for it is assumed that every well equipped pharmacy is already supplied with these standard publications. A glance at the general table of contents presented in the advertising pages of this issue will give you an idea of the character and scope of the work. It is a thoroughly practical work.

6008. Family Liniment.

(H. P.) Try one of the following:

(1.)
Soap liniment..... 1½ ounces.
Tincture capsicum..... ¼ ounce.
Aqua ammonia..... ¼ ounce.
Alcohol ½ ounce.

(2.)
Oil of cloves..... 1 dram.
Oil of saffras..... 2 ounces.
Spirit camphor, enough
to make..... 4 ounces.

(3.) Magnetic Liniment.

Oil turpentine..... 9 ounces.
Tincture capsicum..... 12 ounces.
Spirit camphor..... 96 ounces.
Stronger water ammonia 9 ounces.
Alcohol 15 ounces.
Oil saffras..... ¼ ounce.

The Era Formulary gives this formula for Popular Liniment.

- (4.)
 Tincture capsicum..... 2 parts.
 Tincture myrrh..... 2 parts.
 Tincture opium..... 2 parts.
 Tincture guaiac..... 1 part.
 Spirit camphor..... 8 parts.

6009. Deodorizing Recovered Alcohol.

(Carbon.) asks for a process to deodorize alcohol recovered by distillation from the marc in the manufacture of fluid extract of buchu. A great many schemes have been proposed for the purpose, such as repeated distillations with permanganate of potassium and other oxidizing agents similar to those given in the processes for preparing cologne spirit in another column. These processes work very well with the alcohol recovered in the manufacture of most of the fluid extracts, but it has been found to be nearly impossible from the standpoint of economy, to completely deodorize an alcohol recovered in the manufacture of fluid extract of buchu, cubeba, etc. These drugs contain pungent volatile oils, with an intense penetrating odor clinging to the alcohol with great persistence even after repeated distillations. Alcohol so recovered is almost hopelessly contaminated and is only fit to be employed in the next operation with the same drug, or to be used as the solvent in the manufacture of preparations, such as liniments or other applications where the odor does not interfere.

6010. Grease Face Paints.

(C. H. B.)

(1.) White.

- Prepared chalk..... 80 parts.
 Zinc white..... 80 parts.
 Bismuth subnitrate..... 80 parts.
 Asbestos..... 80 parts.
 Oil of sweet almonds,
 about..... 50 parts.
 Camphor..... 2 parts.
 Oil of peppermint..... 10 parts.
 Extract of ess. bouquet... 10 parts.

(2.) Pink.

- Zinc white..... 1,000 parts.
 Bismuth subnitrate..... 1,000 parts.
 Asbestos..... 1,000 parts.
 Oil of sweet almonds,
 about..... 400 parts.
 Camphor..... 220 parts.
 Oil of peppermint..... 220 parts.
 Extract of ess. bouquet. 100 parts.
 Eosin..... 4 parts.

(3.) Dark Red.

Same as above, coloring with ammonia solution of carmine.

(4.) Flesh.

- Prepared chalk..... 200 parts
 Zinc white..... 200 parts.
 Orris root..... 50 parts.
 Cinnabar..... 30 parts.
 Oil of sweet almonds,
 about..... 60 parts.
 Camphor..... 3 parts.
 Oil peppermint..... 3 parts.
 Tincture of crocus..... 20 parts.
 Extract of ess. bouquet.. 15 parts.

(5.) Nigger Black.

Beat the finest lampblack into a stiff paste with glycerine, and apply with a sponge; if necessary mix a little water with it when using. Easily removed.

A large collection of formulas for face paints may be found in the Era Formulary, pages 156 and 157.

6011. Poultice Powder.

(F. W. C.)

- Powdered mustard..... 20 ounces.
 Powdered foenugreek..... 15 ounces.
 Ground oyster shells..... 12 ounces.
 Ground bone..... 8 ounces.
 Powdered sodium sulphate..... 4 ounces.
 Powdered capsicum..... 10 ounces.
 Sulphate of antimony..... 10 ounces.
 Oxide of iron..... 10 ounces.
 Corn flour..... 20 ounces.
 Powdered asofoetida..... 1 ounce.

(2.) Powder to Make Hens Lay.

- Egg shells, powdered..... 4 ounces.
 Sulphate of iron, powdered 4 ounces.
 Capsicum, powdered..... 4 ounces.
 Foenugreek, powdered.... 2 ounces.
 Black pepper, powdered... 1 ounce.
 Silver sand..... 2 ounces.
 Dog biscuit, powdered... 6 ounces.

Mix. A tablespoonful to be mixed with sufficient meal or porridge to feed 20 hens. See also formulas Nos. 2668, 2670 and 2672 in the Era Formulary.

6012. Elixir Pancreatin, Pepsin and Bismuth.

(F. W. C.) The particular formula you desire is not available. The following, however, may be of service to you:

- Pancreatin..... 256 grains.
 Pepsin..... 256 grains.
 Glycerine..... 4 ounces.
 Elixir, enough to make.. 1 pint.

Macerate the powders for 24 hours or longer in the elixir and glycerine, and filter. In the filtrate dissolve 61 grains citrate of bismuth and ammonium and 1½ grains sulphate of strychnine. Each fluid dram of this elixir contains 2 grains each pancreatin and pepsin, ½ grain citrate of bismuth and ammonium, and 1-100 grain of strychnine. You may also prepare an elixir containing the above named ingredients by dissolving the desired quantity of pancreatin in the elixir of pepsin, bismuth and strychnine of the National Formulary.

6013. Distinction Between Contagion and Infection.

(W. D.) These words have been used in very diverse senses; but in general, a contagious disease has been considered as one which is caught from another by contact, by the breath, by body effluvia, etc.; while an infectious disease supposes some entirely different cause acting by a hidden influence, like the miasmi of prison ships, of marshes, etc., infecting the system with disease. Webster's dictionary states that this distinction, though not universally admitted by medical men, as to the literal meaning of the words, certainly applies to them in their figurative use. Thus we speak of the contagious influence of evil associates, the contagion of bad example, the contagion of fear, etc., when we refer to transmission by proximity or contact. On the other hand, we speak of infection by bad principles, etc., when we consider anything as diffused abroad by some hidden influence. As examples of contagious diseases may be mentioned cholera, small-pox, etc., while measles, scarlet fever, etc., have been considered infectious diseases.

6014. Compound Solution of Ammonium Acetate.

(P. P.) We are not aware of the existence of a formula under this title. It may be that the prescriber intended the concentrated solution of ammonium acetate of the British Pharmacopoeia from which

that work directs the solution of ammonium acetate to be made. Of course, this is only conjecture. It may be also that the prescriber had some private formula under the title which he wanted dispensed. Here are two formulas of combinations in which solution of ammonium acetate is used:

(1.)

- Solution ammonium acetate..... 6 drams.
 Tincture opium, camphorated..... 1 dram.
 Spirit nitrous ether..... 1 dram.
 Syrup tolu..... 1 dram.
 Water..... 2 ounces.

(2.)

- Solution ammonium acetate..... 2 fl. ounces.
 Cinnamon water..... 1 fl. ounce.
 Antimonial wine..... 1 fl. dram.
 Distilled water..... 2 fl. ounces.
 A tablespoonful every two or three hours.

6015. Elixir Orange Compound.

(A. G.) We can suggest no better formula than that given in the National Formulary. However, here is a formula very similar to that given in the work named, and which was formerly official in the German Pharmacopoeia:

- Orange peel, cut..... 50 parts.
 Cinnamon..... 10 parts.
 Potassium carbonate.... 2½ parts.
 Sherry wine..... 250 parts.
 Extract gentian..... 5 parts.
 Extract wormwood..... 5 parts.
 Extract buckbean..... 5 parts.
 Extract cascarilla..... 5 parts.

Macerate the orange, cinnamon and potassium carbonate for 8 days in the wine, pour off, express, and dissolve the extracts in the liquid.

Here is another formula presented to the American Pharmaceutical Association in 1889 by R. W. Gardner under the same title:

- Tincture of orange peel.. 5 ounces.
 Curacao flavor (cordial). 5 ounces.
 Orange flower water.... 3 ounces.
 Syrup..... 26 ounces.
 Alcohol..... 26 ounces.
 Precipitated phosphate of lime, quantity sufficient.
 Water enough to complete..... 8 pints.

6016. Decolorized Tincture of Iodine.

(L. E. B.) A decolorized tincture of iodine does not contain free iodine. Iodine, if free, always retains its characteristic color and odor, whether dry or in solution. When these have disappeared you may safely assume that the iodine has entered into some combination. The process you name is essentially that of the National Formulary, with the exception that you use tincture of iodine instead of iodine. The reaction which occurs would be somewhat difficult to express by a chemical equation, but the finished solution contains ammonium iodide, ethyl iodide, triethylamine iodide, together with sodium iodide, sulphate, and tetrathionate. A crystalline precipitate of the last named salt is apt to form upon standing for some time. Decolorized tincture of iodine is by no means as powerful a counter-irritant as the original tincture and, though it possesses some valuable properties, it would seem to be of no more value as a local discutient than a solution of iodide of sodium or ammonium in water.

6017. Lanoline Cold Cream.

(J. W. O.)

(1.)

Anhydrous lanoline	10 parts.
Benzoated lard	20 parts.
Rose water	20 parts.

(2.)

Lanolin	4 drams.
Powdered soap	2 drams.
Spirit bergamot (1 to 16)	2 fl. drams.
Rose water	4 fl. ounces.

(3.)

The Era Formulary gives this: White wax, 2 ounces, spermaceti, 2 ounces; oil of sweet almond, 14 fluid ounces. Melt together and add lanolin, 6 ounces; stir until nearly cold, adding gradually a solution of borax (75 grains) in water, 9 fluid ounces. Perfume with.

Oil bergamot	15 minims.
Oil rose	15 minims.
Oil neroli	10 drops.
Oil ylang ylang	2 drops.
Oil orris	1 drop.
Tincture musk	5 drops.
Coumarin	¼ grain.
Vanillin	3 grains.

The coumarin and vanillin should be dissolved in a little oil of sweet almond.

6018. Bleaching a Linen Duster.

(J. A. W.)

Twelvetree's process for whitening linen orders 8 ounces each of good soap and soda, 3 ounces of unslaked lime, and 1 gallon of boiling water; mix all well together and let stand for twelve hours. Decant the clear solution into a pot containing 10 gallons of boiling water, being careful that all sediment is left behind. In this solution boil the garment for about half an hour, take out, scald, blue, rinse in soft water and dry.

The bleaching may also be accomplished by means of a solution of chlorinated lime. The powder is stirred up with water, and the clear solution used. Just how strong this solution needs to be can only be determined by experience, as the chlorine evolved is more or less injurious to the fabric. Another preparation and a very efficient bleaching agent is peroxide of hydrogen. For remarks upon its use see Era, February 1, 1893, page 109, and Era of March 15, 1893, page 215.

6019. Rangoon Oil.

(W. D.)

You state that this preparation is one which you have found of use as a lubricant for rifles, etc. We are inclined to think that Rangoon tar or Rangoon petroleum is the product sought, particularly as petroleum finds very satisfactory application to rifle barrels as a protection from rust. Rangoon petroleum is of a nearly liquid consistence, of greenish-brown color, and is found in deposit in Burmah. Very probably a request for Rangoon oil in the American market would be supplied with an American petroleum in some form. The following process is used for cleaning guns with petroleum: Some tow is wrapped around the ramrod and enough petroleum poured upon it to thoroughly moisten it and the barrel rubbed out thoroughly with this swab. Then it is well to follow with a brush of stiff bristles also moistened with petroleum and then repeat the first operation, continuing the rubbing as long as the tow comes out soiled. Petroleum is a great enemy to water, covering the gun barrel with a thin film which effectually keeps away moisture, but you should observe care that a good grade of petroleum is employed, and also that it does not come in contact with the polished stock.

6020. Cholera Remedies.

(H. P.) The formula you name is thus given by the New Idea:

Tincture capsicum	1 ounce.
Spirit camphor	¾ ounce.
Tincture guaiacum	¾ ounce.

Color tincture, quantity sufficient.
Formulas for Squibb's Cholera Mixture, Thielemann's Cholera Drops, Loomis' Diarrhoea Mixture and two or three other well-known preparations may be found under cholera mixtures in the National Formulary, page 88. Here are two more formulas from the Era Formulary:

(1.) Aromatic tincture	40 parts.
Acetic ether	9 parts.
Oil peppermint	1 part.

(2.) Russian Cholera Drops.

Tincture opium	75 minims.
Tincture nux vomica	15 minims.
Tincture valerian	2½ drams.
Oil peppermint	3 drops.

Dose, 25 to 30 drops every hour or two, alone or in peppermint water.

6021. Mixture for Epilepsy.

(H. E. H.) A careful search has failed to reveal the formula you ask. The following formulas are types of the remedies used in the treatment of epilepsy: Brown-Sequard, Paris.

Ammonium bromide	8 drams.
Potassium iodide	8 drams.
Potassium bromide	6 drams.
Sodium bicarbonate	2 drams.
Tincture columbo	2 ounces.
Distilled water	6 ounces.

Take a dessertspoonful after each meal, and a tablespoonful at bedtime.

Prof. Bartholow, Philadelphia, prescribes this:

Sodium bromide	6 drams.
Potassium bromide	6 drams.
Solution potassium arsenite	1 dram.
Tincture columbo	3 ounces.
Syrup ginger, enough to make	6 ounces.

Dessertspoonful after meals and at bedtime.

Hager gives this:

Borax	20.0 grams.
Potassium bromide	10.0 grams.
Glycerine	25.0 grams.
Ether	1.0 grams.
Oil peppermint	0.15 grams.
Tincture cinnamon	5.0 grams.
Distilled water	350.0 grams.

6022. Cologne Spirit.

(Druggist.) Cologne Spirit as ordinarily understood is the highest grade of alcohol, having been so purified as to be devoid of all color and odor. Any number of processes have been suggested for this purpose, but none of them seems to produce the desired quality of alcohol, unless used in connection with distillation. The process of purification by means of permanganate of potassium, and afterwards filtering through charcoal, will no doubt remove much foreign matter, if present, but it will not so completely deodorize the spirits, as would subsequent distillation. In fact this method is made use of in the well known Atwood's "patent" process for the purification of alcohol by distillation over manganic acid or permanganate of potassium or sodium, which substances are used to destroy the fusel oil and other foreign substances in the alcohol. Another process for deodorizing alcohol, consists in adding to each barrel of the spirit a gallon of water saturated with chlorine gas; agitate thoroughly, let it stand for 12 hours, then saturate with

chalk (which, combining with the chlorine, forms chloride of lime), and distill. Filtering through animal charcoal after precipitating with the chalk affords, as in the case of the permanganate, only a fair substitute for the redistilled alcohol. The fusel oil can be separated from alcohol, in small quantity, by adding a few drops of olive oil and thoroughly agitating in a bottle and allowing it to settle, and then decant. The olive oil combines with and retains the fusel oil. It is said that alcohol distilled over soap loses its empyreumatic odor and taste entirely. At about 25° F., the soap ceases to retain the alcohol and the empyreumatic oil at that temperature remains in combination with the soap, which forms the residuum of the distillation. The oil is then carried off at a higher temperature by the watery vapor, which is formed during a second distillation, the product of which is soap free from empyreuma, and is fit to be used again for a similar process. In all of these cases the alcoholic strength must be estimated and adjusted after distillation.

6023. Solution of Magnesium Citrate.

(J. W. O.)

The principal objection to the pharmacopoeial method of 1880 was that the citrate of magnesium crystallized out, which rendered the solution almost unfit for use. A number of processes have been proposed but there seems to be objections to each one of them. The United States Pharmacopoeia of 1890 increased the quantities of magnesium carbonate and citric acid, but not the relative proportions, so that it is doubtful whether this solution will keep any better than that of 1880. The official solution contains a mixture of acid and normal salts, to which its instability may be ascribed. If a solution of acid magnesium citrate only is desired which will not deposit in the course of time, the quantity of citric acid in the official formula must be increased to 32.98 grams, which includes the necessary amount of acid to supply the deficiency in the syrup. This method, however, produces a very acid liquid, and may be objected to by many persons on that account.

It may be noted that the pharmacopoeia orders plain water to be used, but if the official solution or, indeed, any solution is to be kept on hand, distilled, or better yet, recently boiled and filtered water will be found to be preferable so as to avoid the formation of fungi. The following modification of the pharmacopoeial method has been recommended: Follow the pharmacopoeial method, replace the bulky magnesium carbonate by one-half of the quantity of Jennings' light calcined magnesia. The syrup of citric acid should be introduced into the bottle, and the filtered solution of magnesium citrate very carefully poured in without stirring up the syrup. The potassium bicarbonate, in large crystals, is dropped into the bottle—they gradually dissolve in the syrup of citric acid—and the cork is at once inserted to prevent the loss of carbonic acid gas. The bottle is not disturbed till it is called for, when a vigorous shake mixes the solution of the bicarbonate in the bottom of the bottle with the acid of the liquid above, liberating the carbonic acid gas, and the solution can then always be dispensed in a sparkling condition.

See also Era Formulary, where may be found formulas for six additional processes.

EDMUND A. CRENSHAW.

EDMUND A. CRENSHAW, of the wholesale drug firm of Bullock & Crenshaw, Philadelphia, deceased on the morning of February 19 at his residence in Germantown, a heavy cold contracted on the 14th inst. resulted in pneumonia, terminating his life. He was born in Hanover Co., Virginia, in 1827. His father, Nathaniel Crenshaw, was a prominent member and minister in the Society of Friends, who, after uniting himself with the Friends, liberated all the slaves who came to him by inheritance and brought them to Pennsylvania and saw them comfortably settled as free men.

Edmund A. Crenshaw received his early education at Westtown Boarding School, and subsequently graduated at Haverford College. In 1846 he entered the store of Smith & Hodgson at the northeast corner of Sixth and Arch streets, Philadel-

phia, to learn the drug business. This business house had been established by Daniel B. Smith in 1819. In 1849 he graduated at the Philadelphia College of Pharmacy, and in the same year, in connection with Charles Bullock, succeeded Smith & Hodgson and continued the business at the old stand until 1858, when the firm of Bullock & Crenshaw removed to 528 Arch street.

Mr. Crenshaw was for a number of years a member of the vestry of St. Andrew's Church, during the rectorship of the Rev. W. Bacon Stevens. After removing his residence to Germantown he became a member of the vestry of Christ Church, and subsequently was one of the corporate members of St. Peter's Church on Wayne street, and held the office of accounting warden from its institution.

Coming, as Mr. Crenshaw did, from boyhood to manhood under the best of influ-

ences, and inclined, as he was, to regard the precepts and follow the example of those who had his training in charge, nothing could follow more naturally than an upright life; and such, assuredly, was his. His commanding presence distinguished him among men, while the dignity, courtesy and gentleness of his demeanor made him equally conspicuous among his fellows. In the church, in his business affairs, in his domestic relations and in his social intercourse he was equally respected and beloved by all whose privilege it was to know him. It was less than a week before his death, when he was in his usual good health, that his fellow-members of the Philadelphia Drug Exchange elected him an honorary member of that association as a token of the very high esteem in which he was held by that body.

NEWS COMMENT.

A New London, Ind., druggist has pending against him eleven charges of illegal liquor selling.

Considerable poor and adulterated opium is being rejected by the inspectors in the New York customs house.

The New York State Board of Health, in its annual report, finds a decided improvement in the quality of drugs.

Sacramento, Cal., druggists are being required to toe the mark a little more closely in regard to selling liquor.

C. P. Ochsner, a St. Louis druggist, mourns the loss of \$300, stolen by his storeboy. As yet the thief has not been caught.

The stocks of some of the drug stores in the interior towns in New York are being examined by the state analysts at Albany.

A number of gold watches and other jewelry, but no drugs, were stolen from Henslee & Myatt, Dixon, Tenn., recently by burglars.

It is said that an unusual number of "strikes" against patent medicine concerns and other large industries are being engineered in the New York Legislature at Albany.

A Pittsburg chemist says he can make chloroform from natural gas, and is trying to organize a company to establish its manufacture.

A Tennessee countryman mistook a druggist's soda fountain for a beer pump, and wanted a glass drawn without too much foam on it.

Miss Jennie Entrekien, of Coffeen, Mo., has just been registered by the board of pharmacy, and is the only lady pharmacist in that section.

A striking evidence of the hard times is the fact that druggists are besought by beggars to furnish cathartic pills and other medicines as an act of charity.

A time clock owned by a New Jersey druggist got loose the other day and did many dollars' worth of damage to shelf-ware and stock before he was captured.

A drug clerk in Brazil, Ind., aged 21 years, was married the other day to a widow twice his age. He finds a family of children to whom he is to act as father.

The Boston Medical Co. has been incorporated at San Francisco, Cal., by John Bamber, A. Sifford, C. H. Powers, L. B. Caldwell and R. P. Clement. The capital stock is \$50,000.

Druggist S. F. Boyce, of Duluth, Minn., has been sorely afflicted through the death of his wife from typhoid fever on February 10. The heartiest sympathies of his friends are extended.

The Pacific Druggist Publishing Company, of San Francisco, has been incorporated with a capital stock of \$15,000. The directors are R. M. Wood, Jennie E. Scott, Winfield Scott, A. C. Bonnell and G. M. Wilde.

Druggist H. C. Giesler, of Fulton, N. Y., has recently refitted his store in quartered oak, handsomely carved, and with liberal use of plate glass. Whitall, Tatum & Co. supplied the recess label shelf bottles.

A St. Paul resident wanted a drink of whiskey and helped himself in a drug store, but, unfortunately, he took a drink of landanum instead of the spirits he desired, and his life was saved only after great exertion. He will get a regular physician's prescription hereafter.

The American Glucose Co.'s plant at Buffalo was damaged \$10,000 by fire February 15, but complete destruction was averted by the hard work of the firemen.

W. H. Nelson, a druggist of Sioux Falls, S. D., who failed a few months ago, is having his affairs investigated by creditors, who claim that certain transfers of property were made with a view to defrauding them.

A. H. Luckenbach, druggist of Oconto, Wis., has been away on an extensive trip to southern cities. In comparison with the affairs of brother druggists in other cities, he finds the success he has achieved very satisfactory.

The drug store of Walter H. Johnston, at San Jose, Cal., was damaged by fire to the extent of \$2,000 on the stock of which there is an insurance of \$3,000. The chemicals in the laboratory are supposed to have caused the fire.

The driver of an express wagon in Buffalo, while delivering a package at a drug house, helped himself to a double handful of cathartic pills from an open package. He says he will be more careful next time what he fills up on.

"A rate war in patent medicines is on at Parsons, Kas., and you can get relieved 'that tired feeling,' 'those pains in the back,' the 'feeling of goneness' and 'coughs, colds, fevers and headaches' for fifty cents a bottle," says an editorial paragrapher in the Kansas City Star.

Whitall, Tatum & Co. have sold, through their traveler, E. P. M. De Camp, a full new set of shelfware, show bottles, etc., to Chaffee & Merckel, who succeed A. Mullock, the Binghamton, N. Y., druggist, who was recently burned out. The new stock is to be furnished by Corbin, Sons & Co., Binghamton.

The Kansas City Star says: A lawyer at Charleston, Mo., has received a letter from a Kentucky party who wants to go into the "practis of medison," and wishes to know what he must do before he can sell drugs and "handle whiskey" in the "State of Mosura." The sick and afflicted should look out for him.

Rochester, N. Y., druggists are making a strong fight against the one or two cut-rate stores in that city, and the latter are finding it very hard to secure supplies. The papers profit from the agitation, and we are in receipt of long clippings from them wherein the cutters make their customary address to the public. Some correspondents tell us that the cutters have to pay thirty cents a line for this class of advertising.

The Wholesale Drug Trade Bowling Association is holding a tournament at 409 Pearl street, New York City. Teams from the various jobbing houses compete. The first games were played February 17, and both were won by Whitall, Tatum & Co. Dates set for matches are February 24, March 3, 10, 17, 24 and 31 and April 7. The schedule arranged shows that some of the best men in the trade will come into active competition.

UNITED STATES DISPENSARY.

The publishers of this work state that the insertion of important comments upon recent researches in the new or 17th edition, compels them to delay its issue until March 20. On account of its greatly increased value, the physician and pharmacist will reap a benefit which will completely offset any inconvenience that may have been suffered by the delay.

OBITUARY.

Samuel Kidder, one of the best known and most highly respected citizens and a retired druggist of Lowell, Mass., died at the age of 72 years on February 15.

H. R. Woodward, of Allaire, Woodward & Co., Peoria, Ill., died in that city February 10 after an illness of several months' duration. He was an influential business man, and was prominently identified with the affairs of the city. Besides his drug connections he held a controlling interest in the city's street railway system, and exercised an influential power in other public enterprises. He was 52 years of age.

Joseph I. Younglove, the well known druggist of Bowling Green, Ky., died February 1 of cancer of the stomach, from which he had suffered for some time. He was born in 1818 at Johnstown, N. Y., and was consequently in the 76th year of his age. Since the age of 14 he had followed pharmacy, serving in various cities in New York, Pennsylvania and last in Louisville, He established himself in Bowling Green in 1842.

William H. Webb, one of the best known of the Philadelphia pharmaceutical fraternity, died at his residence, 1426 North Twenty-sixth street, February 9, aged about 70 years. Mr. Webb was born at York, Pa., on September 6, 1824, where he was educated. When about to begin work as a young man he removed to Baltimore and learned the drug business. Being of Quaker family it was natural that Mr. Webb should before long come to Philadelphia. He secured a position and in 1845 graduated from the Philadelphia College of Pharmacy, and then started in business for himself at Spring Garden and Tenth streets. Mr. Webb was elected a member of the College of Pharmacy in 1857, and in 1872 became a member of the Board of Trustees. In 1880 he succeeded Mr. Bunting as treasurer of that institution. He was active as one of the managers of the Friends' meeting and of the Jesse George Industrial School.

John G. Fratz, the veteran druggist and founder of the Cincinnati College of Pharmacy, died at Cincinnati of the 20th inst. The deceased was one of the best known druggists in Ohio and was a man of many admirable attributes. He was born in this city on West Eighth street, September 25, 1841. He studied medicine for awhile with Dr. Alexander, who had an office at Baymiller and Central avenue. He then secured a position as drug clerk with Anthony Hiller, a druggist at Pearl and Broadway. After serving his apprenticeship employment was given him in the drug store of Gustav Zirkhoff at Baymiller and George streets, and, at the proprietor's death Mr. Fratz purchased the store and remained there until 1870, when he moved his business to the opposite corner where he subsequently did a thriving business.

In 1877 Mr. Fratz was elected court treasurer. He was also a member of the Board of Health and afterward founded the Cincinnati College of Pharmacy. He was a leading member of the Catholic Knights of America and was also identified with a number of social organizations. He was a power in the ranks of the local Democracy and was always

consulted in momentous questions which had a tendency to affect his party. Mr. Fratz was undoubtedly one of the best known men in this city.

In the west end, where Mr. Fratz's pharmacy was located, he was known as a friend of the poor. Whenever sickness entered any of the homes of the poverty-stricken Mr. Fratz enjoined the afflicted ones not to hesitate in coming to his store to get the necessary medicine. Mr. Fratz was one of the best learned pharmacists in Southern Ohio, and a devoted patron of art. In his residence are many paintings and etchings, the handiwork of some of the most noted artists of Europe. Mr. Fratz carried life insurance amounting to \$30,000. His son will conduct the store made famous by his father.

GERMAN UNIVERSITY NOTES.

The call of Prof. Zacharias, extraordinary professor of botany at Strassburg, to the Botanical Gardens of Hamburg is a sad blow to the university. Certainly no teacher in the natural science faculty was more attached to his students than he, while it will be difficult to obtain a more gifted and enthusiastic conductor of the numerous botanical excursions. Zacharias is possessed of remarkable organizing ability which he demonstrated in the revival of the "Philomatic Society" of Alsace-Lorraine, when, in the capacity of president, he brought the membership up to over 300 in nine months, after it had been forgotten for two years.

Prof. Ernst von Meyer, of Leipzig, has been appointed professor of organic chemistry at the Dresden Polytechnicum.

Dr. G. Linck, of Strassburg University, has been made professor of petrography. The excellent physiological chemist, Prof. E. Drechsel, formerly director of the chemical laboratories of the Physiological Institute of Leipzig University, has been made professor of physiological chemistry and pharmacology at the University of Berne.

The protracted illness of the American, Dr. Richard Marburg, privat-docent in organic chemistry at the Strassburg University, necessitated his resignation and the call of Dr. Erlenmeyer of the University of Bonn in his stead.

The Columbian Exposition had the effect of bringing many American students home from Europe, and now there is a universal scarcity as compared with a year ago.

J. E. Groeck, for many years assistant at the Pharmaceutical Institute in Strassburg, has opened a pharmacy in Strassburg-Neudorf.

The government of New Zealand has decided to offer a bounty of \$10 upon every 100 tons of starch manufactured in the colony during 1894 and 1895.

A sanguine individual down in Ohio thinks he has figured out a way to end the drug-store-saloon business. He suggests that a law be passed providing that where local option is in effect druggists shall not sell whisky in quantity less than one gallon and that where physicians prescribe liquor they shall furnish it themselves. Assuredly this would stop the drug store saloon, but how about the tidy little business that the physician would pick up?

NEW YORK.

New York, February 26.—It is no secret that the increase of N. W. D. A. dues from \$10 to \$25 has created considerable talk among the members of that organization in this city. More than that, it has caused the resignation of quite a number of gentlemen who had previously felt that to belong to the N. W. D. A. was well worth the small sum required as dues. The reason for the increase in dues is well known, apparently, being stated at the last meeting of the organization. No one seems to think that the reason was not a good and sufficient one, but it is true that something will have to be done at the next meeting to keep several men in the fold, reason or no reason. These gentlemen who have felt called upon to withdraw are the ones the N. W. D. A. ought not to lose. They may have nothing to do with the hard work, may not shape legislation or prove potent factors for the welfare of the association, but they are the men who help to make the meetings of the N. W. D. A. enjoyable, and as such are always welcome.

It was put to the Era correspondent to-day in this way. A member of the association, whose business is such that no legislation by or through the N. W. D. A. can possibly affect it, considers the meetings as simply occasions when he can meet his fellows socially, shake hands with those he has not seen for a little while, renew old acquaintances, in fact, a sort of outing for which he was quite willing to pay the \$10.

To raise that man's dues to \$25 was to cause him to do a little thinking, and the result was that he decided that the \$25 could be spent to much greater advantage. The names of those who have sent in their resignations would show quite a number of this class. All may yet be well, however. It is given out on good authority that all of the gentlemen who have sent in their resignations have been asked to let their papers lie unacted upon until the next meeting of the association, which is to take place in this city. Then it is certain that the matter will be adjusted. "The general sentiment seems to be," said one interested member of the N. W. D. A., "that there should be a distinction made between the fees of associate and other members. The fees for associate members should be put back at the old figure, \$10; but that will all be fixed at the next meeting." The date for the N. W. D. A. meeting has not yet been fixed, but it will be held between the 15th of September and the 15th of October; some time about the 1st of October.

If you see a drug trade man going along the street with his gaze directed to the sky, you may be sure he is one of those schemers who are just now getting up a corner in opium. There is said to be a formidable combine now at work, at the head of which is a gentleman well known in the proprietary medicine line. If the members of this syndicate think there is one wide-awake man who doesn't know about the scheme, he is very much mistaken.

The meeting of the Interstate League is still a topic of conversation when the drug men get together. Happening to join a party at the "Century" the other day, I heard some very interesting talk on the "rebate" matter. One of the party, a well known member of a firm located

near William street (now, that's easy) said: "The difference between the League and the Detroit plan is a very serious one to some proprietors. How are infants' food and fluid meat manufacturers to live up to the rebate plan as constituted by the Interstate League, which went back on the Detroit plan? Those manufacturers sell most of their products through the grocers, and you can't go and ask them to commit financial suicide."

Another member of the group said: "The policy of the house to which I have the honor to belong has been clearly defined as one looking to the protection of the retailer in his securing legitimate profits on all proprietary goods. But there has been no plan so far presented which has avoided, or can, in my estimation, avoid the difficulties attendant upon its execution. There are always some jobbers, as well as retailers, who will not only break a contract which they have willingly signed, but will also visit their concealed indignation upon any manufacturer who shall attempt to enforce the terms of such contract. When, in connection with this, the difficulty of actually proving bad faith is considered, you will see that it is difficult for the manufacturer, under any plan that has so far been suggested, to work in harmony for the interest of the retailer. In spite of all precautions, the manufacturers themselves will sometimes be imposed upon, and in my experience I have found that rival manufacturers will procure the services of reputable brokers, jobbers or retailers to procure our goods in order to effect a sale of their own products, and in order to do this will sell Jones' plasters, for instance, without any regard to quantity at the highest discount. If we trace the goods to the shelves of the cutters, we cannot prove that they may not have been furnished by jobbers, for instance, to a reputable dealer and by roundabout ways to the cutters."

There is a point in connection with the "forged drug orders" case just brought to the attention of the trade that is well worth emphasizing, especially as it has not yet been mentioned in print. It is this: A firm in any line of business that is informed that other firms in different lines of trade are being swindled in its name should promptly let the trade journals know of the deception, so that by a few days at the most the firms may be prepared to catch the rascal. A slight service of this kind recently would have saved Lehn & Fink from being duped. Bruen Bros. & Ritchie had given a man who presented an order apparently coming from Stephen H. Mills & Co., a gross of plasters. Finding out that the order was a bogus one, Mills & Co. could have easily notified the trade journals. Then, when the same man presented an order bearing Mills & Co.'s name at Lehn & Fink's he would have been held for the police. As it was, Lehn & Fink knew nothing about the previous swindle, so the rascal got another gross of plasters. It is not necessary to talk about care being exercised in the matter of filling orders without the bearer of the order being identified. All firms exercise care in such cases, but the most careful get caught sometimes. Four years ago Lehn & Fink caught a swindler through notification by another firm. It is hoped that the present case will have the same sort of an ending.

A gentleman in the trade who has been up the state during the past week reports the druggists up Troy way as saying that they never saw such hard times. In Poughkeepsie and Poughkeepsie things seem to be better, or, at any rate, more promising. The new tariff bill is all the business men, druggists included, talk about now, and they seem to have plenty of time to do their talking in. They are very anxious to hear up the state how things are going on in New York, and cheered up when they are told that business prospects are brightening. Another unfortunate who has been obliged to immerse himself in South Jersey for a week says all is like the tomb down there—very quiet.

That telephone matter, which is so interesting to the druggists over in Brooklyn, may yet develop into a good-sized war with the company. The matter was discussed at the meeting of the Kings County Pharmaceutical Society on Tuesday last. At the same meeting a paper was read by W. P. De Forest on "The Preparations of the New Pharmacopoeia," and was discussed by several of the members. "How May We Make the Best Citrate of Magnesia" was another subject of talk. Many were the regrets expressed on the death of Mr. Paddock.

John R. Hardin will continue as receiver of the Crescent Drug Co., of Newark. The company was a cutter in the line of perfumes, but the local trade stopped that business by appealing to the manufacturers.

Chairman Thomas F. Main presided at the regular monthly meeting of the drug section of the Board of Trade and Transportation, which was held on Thursday last. Reports of satisfactory progress were made by Chairman Hartford, of the committee on membership; Chairman Stallman, of the committee on importers of drugs and chemicals, and Mr. Rogers, of the committee on legislation. Attention was directed by Mr. Rogers to the new pure food bill now before the House of Representatives, and at his request it was referred to the committee on legislation. Letters were read from the Philadelphia and New England Drug Exchanges referring to interchange of ideas and to co-operation. It was the sentiment of the meeting that the movement started by Mr. Rogers, the former chairman of the section, to bring the drug associations closer together should be continued. Chairman Main announced the committees for the year

George Rau, of Second avenue and Sixteenth street, has sold out his store to Grimm & Wells.

J. T. Berry, secretary of the Crowds Drug Company, Dallas, Tex., has been a visitor to the city.

S. M. Strong, of Strong, Cobb & Co., Cleveland, treasurer of the N. W. D. A., has been in town this week.

Peter J. Tormey, representative of W. H. Schieffelin & Co. in San Francisco, has been in this city for the past two weeks.

W. G. Moffitt, of the Astor House drug store, has made some fountain-manufacturing firm happy by putting in a new apparatus.

William N. Clark, the druggist at the corner of Jerome avenue and 165th street, and John J. Carle, whose store is at 153 Water street, were members of the February grand jury.

The names of William H. Schieffelin and John L. Ilker appear in the list of additions to the general committee of the citizens' relief committee.

Prominent business men of the upper wards of the city are organizing a board of trade to be called the North Side. Among those who will become charter members is S. W. Fairchild.

C. M. Morsebeau, son of a member of the firm of W. H. Schieffelin & Co., has been quite ill recently, but his physicians report him as very much improved. He will probably be out in a few days.

George F. Shieles, a well known druggist, died at his home, 63 East Twelfth street, on Sunday. He was born in 1826 at Merida, Yucatan, and graduated from the New York College of Pharmacy in 1851.

H. A. D'Acuel, of the Parthen, D'Acuel Drug Co., of Butte, Mont., has been in this city for a few days. He sails for Europe soon. Mr. D'Acuel enjoys the pleasure of a trip across the ocean very often.

A Harlem druggist asserts that people are doctoring themselves nowadays more than for some time past. Instead of visiting his store with physicians' prescriptions, as they used to, they call in for herbs, salts and the like.

The new Hegeman Company has been incorporated with a capital stock of \$50,000. The articles of incorporation were issued on February 10, and give the following as directors: J. N. Hegeman, J. W. Ferrier, J. G. Glenn, L. A. Wilson. The Hegeman store, recently burned out, will be opened for business about March 1.

Druggist Simon, of 224 Fifth avenue, has offered to put up all prescriptions called for by poor people living in the district bounded by Third and Eighth avenues and 125th and 155th streets without cost to the applicant. In his notice Mr. Simon says: "We like to do all in our power to help the poor in these hard times. They cannot go to the free dispensaries all the time, and many of them are too ill to go out of their houses."

Every Saturday afternoon for the next fourteen weeks there will be some good sport at a downtown bowling alley, where three teams from the drug men's bowling league will struggle for the mastery. The first game was played last Saturday. Among the firms who are represented in the league are: McKesson & Robbins, Dodge & Gleot, Seabury & Johnson, Whitehall, Tatum & Co. and C. G. Bacon & Co.

Paepek & Tellkampff, of Sixth avenue and Fourteenth street, have sold the lease of their store. Their stock has been sold to C. F. Hanson, whose store is at the corner of Sixth avenue and Sixteenth street. Mr. Hanson also takes the prescription books. The reason for this change is that Mr. Paepek's health has been such that he is compelled to retire from business. His friends wish him a speedy restoration.

R. W. Walker, agent for James W. Tufts in this city, reports that the firm has placed or will supply fountains in the following new drug stores: Jacob Morin, 48 Atlantic avenue, Brooklyn; William N. Schatz, Central and Imrod streets, Brooklyn; Henry C. Smith, Sea Cliff, L. I.; P. J. Dwyer, New Brighton, S. I., and John Leveridge, Bayonne, N. J. The Tufts fountain is also to be seen in the newly refitted stores of G. R. Klutrow, 175 Lexington avenue; F. C. Heckel,

389 Manhattan avenue, and H. T. Klein, 295 Sixth avenue.

O. G. Kalleh, formerly of Hudson's, where he was the right-hand man of the store, may not know that he and his new store at the corner of Twenty-third street and Third avenue are at present the cause of considerable wonder. All the druggists in town think that Mr. Kalleh's store is a thing of beauty, and they are speculative on its cost. They hope the venture will meet with the success that is due to such a hard worker and good fellow as O. G. K.

The drug clerks talked a good deal last spring about forming a society for mutual protection and benefit. What has become of that organization? There have been many attempts made to get the drug clerks to form a real live association, but the interest displayed in the movement was not such as to warrant anybody's wasting valuable time in the cause. It is said that one of the chief troubles in starting a club of this sort is the lack of money. It would take at least \$500 to furnish and hire a couple of rooms, and it might just as well be \$1,000 as far as getting it is concerned.

A well attended meeting of the New York section of the American Chemical Society was held on the night of February 9 at the University of the City of New York. Prof. P. T. Austen presided. S. Stillwell read a paper on the manufacture of compressed gases, explaining the details in the production of compressed oxygen gas and liquified nitrous oxide. Gas compressing pumps giving a pressure of 15,000 pounds to the square inch were described. Attention was drawn to the difficulties of removing the organic odor from ammonia. Dr. Hugo Schweitzer read a paper on the methods of the commercial analysis of lard. This section of the society meets on the second Friday in each month, at 8 p. m., in room 24, of the university building.

The druggist who hasn't a soda fountain in his shop is not considered up to date. During the past few weeks several druggists who have never entered to the thirsty have dropped their conservatism and put in apparatus. There is S. S. Mapes, of Fishkill Landing, whose store was established in 1834. He has just put in his first fountain, and Howell & Sangton, agents for the Low Art Tile Co., furnished him with a very fine one. Charles Loeber, of 187 Third avenue, is another druggist who has never dispensed soda water, and the same firm has put in his fountain. Among other firms supplied by the same agents are: H. A. Faulkner & Son, 129 Hudson street, Hoboken; O. L. Graninger, of Peekskill, and Frank L. Fieger, of East Orange. Mr. Fieger's Arlington Pharmacy is a very popular store. His fountain had to be located under a stairway, so a special form of apparatus had to be made. It will be ready for use next week.

There is one druggist in Washington, D. C., who believes in paying his gas bills at any rate. Morris Blinswanger, a clerk in the employ of D. P. Hieking, of that city, was arrested recently and locked up, charged with the embezzlement of the money his employer had given him to pay a gas bill.

South Manchester, Conn., has a new drug store, with F. B. Horton as proprietor. A fountain has been put in by the Low Co.

BOSTON.

Boston, February 20.—Senator Cronan, of Suffolk, has just introduced a bill into the Massachusetts Senate to prohibit the sale of all patent medicines which contain anything, which, when compounded, is dangerous to anyone using it. The language of the proposed bill is as follows:

"Every owner of a patent or proprietary medicine sold, or offered for sale within this commonwealth, shall, within thirty days after the passage of this act, furnish the state board of health with the formula used in the preparation of the same. The state board of health shall cause all such medicines to be analyzed from time to time, and, if the ingredients used in the preparation of the same are found to be injurious to health, shall advertise the name of such medicine and the result of such analysis in such newspapers as said board may deem best, and shall also notify the owners thereof."

Senator Cronan says in regard to this bill: "It is a measure, I think, of great public interest. The manufacture and sale of these patent medicines have assumed such immense proportions that it seems proper that the legislature should control and regulate the matter. This act is entirely in line with legislation regulating and controlling the sale of milk, vinegar, oleomargarine, and other articles of consumption, the tendency of which, if not properly controlled or regulated, is directly toward the injury of the public health. It is with the belief that there should be some restraint upon the production of articles of consumption that the legislature has passed these laws. It seems to me necessary to place this restraint upon the manufacture and sale of patent medicines that those who rely upon the merits of such medicine to benefit them should not be injured by improper or deleterious ingredients. At present people purchasing such medicines have no knowledge of the ingredients. There is no source of protection for the people who buy such medicines. It is really a protection to the manufacturers of valuable remedies, as well as a protection to the public, as the man who has a good medicine has nothing to fear, while the clause preventing the formula being made public ought to insure the manufacturers against any fear of infringements of their rights."

The anti-cigarette bill has become a perennial fixture at the State House, and it makes its appearance this year as of yore. This time it comes up on a petition of half a dozen men. It is a sweeping measure, for the petitioners want it passed in this shape: "No person shall manufacture, or sell or expose for sale, cigarettes with paper wrappers or cigarette tobacco in any form. Any person violating any of the provisions of this act shall be punished by a fine of \$100 for each offense."

At a recent meeting of the Newton aldermen, a hearing was given to Thomas F. Kelley, of Waltham, to show cause why his sixth-class liquor license should not be revoked. Mr. Kelley acknowledged that his liquor book at the Norumbega pharmacy was not kept according to law, and that he was seldom at the Newton drug store, being engaged in the drug business at Waltham. His lawyer stated that Mr. Kelley would not oppose the revocation of his license, which was already void under the statute of June, 1883. After a short

executive session the board voted to revoke the license.

Probably but few of the millions of people who patronize druggists' soda fountains have ever let a thought of the tariff enter their minds as they quietly enjoy the refreshing drink, yet it appeared that the tariff has a pretty close relation with the fountain. This is shown by the fact that the Boston Marble Cutter's Protective Union has lately sent to Senator Lodge, of this state, a long protest from which the following extracts are taken: "The tariff on marble has been a sore spot in the marble industry of the United States for many years past. It has been too low—so low, in fact, that our employers acknowledge that they are able to have their work manufactured in France, Belgium, and Italy, and then import it to the United States fully 30 per cent. less than it would have cost to have it manufactured here. We will take one branch of the industry as an example—the soda fountain branch. A few years ago we had about 250 men working at it; at the present time we have about ten, and these men are put on short time in summer. All the fountains are manufactured in Europe. The fathers do the cutting, mothers and children the rubbing and polishing. A duty of 50 per cent. is paid here on the foreign valuation, and all that is left for our workmen is to set the fountain up when it is sold. The Wilson bill does not place the duty on marble properly. Take the soda fountain and building work; this is composed almost entirely of thin slabs, and we cannot see how they are going to figure up a cubic foot of it. The product of the marble industry is not one of the necessities of life. It is, in a certain sense, a luxury, and a duty should be placed on it sufficient to protect the American workmen. If the Wilson bill passes, the industry in this country, as far as manufacturing it goes, will be exterminated, and the men working at it at present will be forced to loaf on the streets or force themselves into some other overcrowded industry."

Since the elopement of Arthur A. Chesley, a Roslindale druggist, with a young and handsome married woman, many interesting facts in connection with his early career have come to light. Chesley was born at West Rochester, N. H., and received his education in the public schools of Rochester. He learned the drug business and was employed by S. F. Sanderson, of Rochester. He was genial and popular. He identified himself with the Methodist church and was a member of the Sunday school. That his connections and his character were regarded as all right is shown by the fact that he was paying some attention to Miss Wallace, daughter of the millionaire boot and shoe manufacturer of Rochester. Chesley abandoned the drug business and purchased Niles & Co.'s branch express running between Dover and Rochester, but made a failure of it, and was next associated with a partner in the sale of a railway map of New England. These maps were purchased for 35 cents each and were retailed at 90 cents. Young Chesley expected to harvest a fortune from this business. He went to Claremont to canvas that town for maps, and when his partner joined him some two weeks later he found that Chesley had not sold a map, but was a high-flyer of the first magnitude. He was stopping at

the Belmont hotel, occupying the best rooms, and living like a man possessed of unlimited wealth. From Claremont he went to Bellows Falls, Vt., promising his partner that he would settle down to business, but it was soon learned that he left Claremont without having paid his hotel bills. The hotel people were after him. From Bellows Falls he went to Keene, but made a failure of the business of selling maps. Next he tried to secure admission to a training ship in New York. After this he drifted to the little town of Lee, Mass., where he secured a position in a drug store at \$12 a week. The friend who had tried to establish him successfully in the map-canvassing business, wrote him to come to Boston, where he had a position in a wholesale drug house awaiting him, but Chesley declined, saying that Rochester people would learn of his whereabouts were he to go to Boston; that he had lost money in the express business and at poker in that town, and that he believed it better for him to remain at Lee where he would be least sight of, as far as his old associates were concerned. In time he turned up in Roslindale, where he established himself in a good drug store, and appeared to be prospering.

A reminder of the Attleborough poisoning case in which a druggist's clerk figured rather unpleasantly, was furnished the other day by a little occurrence in Malden. A man went into Sargent's drug store and wanted some rum, then changed his mind and called for whiskey. He was refused, and then said he wanted some alcohol with acconite in it. Mr. Sargent would not give it to him, though he demanded it, and would not leave the store. The police were notified and he was arrested. The next day the judge gave him twenty-four hours to leave the city. Undoubtedly the Attleborough case was in the man's mind, for it was alcohol and acconite that killed the two tramps in that town.

Edwin S. Meigs, for the last two years a popular clerk at A. T. Clarke's drug store in Bradford, Vt., has closed his labors there and entered the employ of Jaynes & Co., of this city. With a desire to show their esteem for Mr. Meigs, twenty of the young men in Bradford tendered him a complimentary banquet, and presented him with a valuable ring.

Last year Howard L. Eldridge, a Brewer (Me.) druggist, was fined \$75 and costs under the liquor nuisance act. He gave bonds to appear in the term of court now in session. Several days ago, Mr. Eldridge having delayed appearing, the county officials attached his house for the amount of the bond, \$500. It came at a time when Mr. Eldridge was trying to secure a loan from a local bank on a mortgage upon his house. He was naturally very much worried. He accompanied his bondsmen to court and upon payment of the costs of the attachment proceedings the bondsmen were relieved of their obligations, and Mr. Eldridge placed in the custody of the sheriff until he could raise the desired amount of money. He was allowed to go home and before doing so completed arrangements for the desired loan, so that everything would be all right again. But the strain and disgrace had been too much for him, and upon reaching his house late in the afternoon he was so completely prostrated that he went immediately to bed and grew rapidly worse until evening when he died. The doctor

pronounced the cause of death to be heart disease, caused by the unusual excitement and strain.

George W. Cate has just opened a drug store in Fall River.

George E. Simpson has opened a drug store in Skowhegan, Me.

John D. Foster has opened a fine new drug store in Bath, Me.

J. W. Parker, of Natick, has bought the drug store of Ladd & Co., of Malden.

J. W. Tufts is going to Florida for a well-earned rest of six weeks or more.

Witch & Woolson have bought the drug store of H. A. Greeley, Hopkinton, Mass.

Dr. A. P. Bissell has bought the drug store of J. V. Comeau, Waterbury, Conn.

J. Gearon, well-known in Fitchburg, has accepted a position in a Brockton drug store.

Just one of the thirty mayors in Massachusetts is a druggist—Hon. John J. Whipple, of Brockton.

Housemann & Co., druggists, 257 Washington street, Roxbury, have just bought a new soda fountain, Tufts.

E. K. Woodward, of Ellsworth, Me., has been visiting Boston to get a full line of supplies for his new drug store.

J. S. Lang & Co., having moved into a new drug store on Broadway, Everett, have bought a fountain of Tufts.

John H. Buckley, Jr., formerly with the John Matthews Apparatus Co., is now representing J. W. Tufts in Maine.

Victor Lussier has opened a drug store in Nashua, N. H. The furnishings include a handsome fountain supplied by Tufts.

Cornelius J. Dwyer, druggist, Marlborough, is financially embarrassed, and his store is under the charge of Michael Burke, as trustee.

Among the new drug stores in western Massachusetts is one at Easthampton, to be conducted by Geo. S. Russell. A fountain was supplied by the Low Co.

An attempt at burglary was made at Taunton one night this month at Clark & Hyland's drug store, but the visitors got nothing for the risk they took.

A handsome drug store is to be opened at the corner of Boylston street and West Chester Park, by A. P. Watson & Co. Mr. Watson was for years with Brown.

In the insolvency Court the cases of William R. Webster, a Roxbury druggist, and Frank D. Litchfield (Willard Remedy Co.) have been adjourned to March 23.

Curran Bros., of New Britain, Conn., have bought a drug store in Holyoke, Mass., and will do business in both places—in Holyoke, under the name of the P. P. Goodall Drug Co.

Charles H. Collins, of Milford, now in business in Callahan Block, has bought the store at the corner of Main and Exchange streets, in that town, formerly owned by F. H. Clark.

C. H. Moore, a Rockland, Me., druggist, appears not to be affected by the hard times, as he was in town the other day, delighting his creditors by settling accounts ahead of time.

An attempt has been made to find a druggist willing to go into business on Boylston street, corner of Fairfield street—a fashionable locality, but the neighborhood is already well served.

A stock company is soon to open a drug store at the corner of Sixth and Union streets, New Bedford, with John H. Nuttall as manager. The Low Co. furnishes the soda fountain.

John Macksey and W. Helmer, of this city, have been granted a patent on apparatus for and process of making carbonated beverages. They have assigned their rights to the American Soda Fountain Co.

The general agent of the Massachusetts Chemical Co., of Boston, has issued a catalogue, which besides describing the company's products in detail gives the first rules for the perfect insulation of dynamos and motors.

John I. Brown & Sons have made their annual distribution of their bronchial troches among the members of the Legislature. This odd gift is always the cause of some amusement; but the troches are very welcome, nevertheless.

Damage of about \$30 was recently caused by a fire in the absorbent cotton factory of B. F. Smith, North Weymouth.

There was a fire on the 13th inst. in West's block, Pittsfield, by which W. H. Currier, a druggist, lost \$400.

Sales of fountains to druggists are reported by the Low Co. as follows: Chas. Loebler, Third avenue, New York; H. A. Faulkner, Hoboken, N. J.; F. L. Pleger, East Orange, N. J.; William Wright, Atlantic City, N. J.; Edwin Yarnold, Washington, D. C.

George F. Dow, a druggist at No. 2521 Washington street, was arrested last Sunday for an alleged illegal sale of intoxicating liquor at the time of arrest. Before making the arrest, the policeman, who was in civilian dress, purchased a half-pint of whiskey.

The Legislative Committee on Liquor Law has reported against fixing the price of druggists' licenses at not less than \$50 nor more than \$500; the same committee reported ought not to pass on a bill of Mr. Jones, of Melrose, relative to granting licenses for the sale of intoxicating liquors to druggists.

John Larrabee, a well-known druggist, for twenty-one years Town Clerk of Melrose, will not be a candidate for re-election at the annual town election in March. Ill health is the cause of this determination. He became Town Clerk when a young man, and is now the oldest town official in Melrose.

Harris & Cox, who now carry on the business so long conducted in Bath, Me., by A. Hallett & Co., have lately been in town to buy supplies. They were recently burned out, and have gone into temporary quarters. A new store is to be built for them. Tufts has supplied a fountain to take the place of the one destroyed.

Sessions of the Board of Registration in Pharmacy were held February 13, 14 and 15, and thirty-eight young men were examined. The following-named were given certificates: William J. Heebner, of Lee; Gorham N. Winslow, of Peabody; Andrew F. Fearn, of Exeter, N. H.; Felix J. McCarthy, of Boston; Honorius J. Sorel, of Fall River; Thomas D. Driscoll, of Quincy; Joseph R. Goddu, of Medford; Wm. T. Weldon, of Boston.

Shortly before midnight the other night two men smashed the front window of the drug store of George S. Curtis, at Peabody, and snatching a box containing \$15, made their escape. Mr. Curtis had the stolen box on exhibition in his window. It was to be given to the customer holding a key that would open it, a key being presented with each purchase. A man was arrested for the theft, but has not been convicted.

PHILADELPHIA.

Philadelphia, February 21. In speaking about the dissatisfaction among some of the members of the N. W. D. A. in regard to the increase of the dues from \$10 to \$25 a year, M. N. Kline said: "I was surprised to hear that a number of our wholesale druggists and those engaged in allied branches had resigned their membership in the N. W. D. A. since the last meeting. There are a few among them whom I recognize as probably having too little interest in the business to justify their retaining their membership. But there certainly are a number of others who have shared in the benefits of the work of this organization and are sharing it to-day to an extent which represents in value many times over the annual dues, and I am quite surprised that such parties should resign by reason of the small advance in the dues. I am told that the probabilities are that action will be taken at the next meeting restricting these increased dues to those interested in the patent medicine sales only."

E. A. Crenshaw's death has been a severe shock to the trade. An appropriate notice is presented in another column.

At a meeting of the Board of Trustees of the college, Prof. Joseph P. Remington, James T. Shinn and Howard B. French were appointed a committee to draft suitable resolutions on the death of Mr. Webb. James T. Shinn was elected treasurer of the college.

The old saying "it is never too late to mend" was very forcibly illustrated last month when J. Donald Marshall became a benedict by marrying Miss Lizzie Smith, of Holmesburg. Mr. Marshall was always considered a confirmed bachelor and for nearly three score of years he has been allowed to carry a night key and to hang his clothes wherever it suited him. Mr. Marshall, or, as he is better known, "Don," is a jolly fellow and somewhat of a musician, being quite a "fiddler." For a long time he and his brother had a wholesale drug store on the north side of Market street, west of Twelfth, but during the last year they have rented the first floor and now occupy the upper stories. The wedding ceremony was performed by the Rev. Mr. Peacock, of Holmesburg, on February 1.

Long & Neely have bought out Louis Genoia, who for a long time has kept the drug store at Twelfth and Chestnut streets. The new owners at one time were clerks for Mr. Genoia and are well acquainted with the trade. Mr. Long has until lately been with the H. K. Mulford Co., at 232 Market street, and Mr. Neely has for the last few years owned and run the drug store at the southwest corner of Nineteenth and Girard avenue. At one time the drug store at Twelfth and Chestnut streets did a flourishing business, but owing to the new methods of the more enterprising competitors the trade has somewhat diminished. The store is well known for its display windows, and on account of its close proximity to the theaters, the hot soda and other temperance liquids are in demand almost every evening between the acts. It is said the new firm will be more aggressive and will make a number of changes in the store and in the mode of conducting business.

George P. Connor is one of the most progressive regular druggists in this city. By the term regular it is meant that

Mr. Connor adheres to list prices, especially on rebate articles. His show window has always something attractive. His latest novelty was the erection of a miniature telegraph line, which he termed the "Tooth Brush Telegraph Line." The tooth brushes were strung artistically along the wires, and underneath were printed the rates, the charge being seven cents a brush.

James T. Shinn has taken as a partner in his Broad and Spruce streets store, I. M. Baer.

Richard M. Somers has sold his store at Seventeenth and Diamond streets to Jacob Elfreth.

Gov. Pattison has appointed Henry E. Porter, of Towanda, as a member of the Pennsylvania State Pharmaceutical Examining Board.

H. L. De Kolb has established himself in a pharmacy in the suburb of Newton, and E. C. Shafer has purchased the Acker store at Branchtown.

John Wyeth, of the firm of John Wyeth & Bro., manufacturers of pharmaceutical specialties, is spending the winter in the south of France.

Horace Moll, formerly proprietor of a pharmacy at the northwest corner of Thirteenth and Market streets, is now traveling for the Clinton Pharmaceutical Company, of Syracuse, N. Y.

Among those who have recently bought well-known pharmacies in this city are W. J. Baumgartner, Broad and Bishop streets; W. H. Galbraith, Ninth and Spring Garden streets; S. L. Knisell, Twelfth and Jefferson streets.

There is considerable talk in drug circles of the owner of a store in the central part of the city who is willing to give up his business. This is a surprise as he implied he meant to make things hum.

The Apothecaries' Union, which has its headquarters at Tenth and Spring Garden streets, is contemplating a change. Several buildings in the center of the city have been sought, but it is thought the one in the neighborhood of Sixth and Arch streets will finally become their home.

The juniors at the college are beginning to think very much about the examinations to be held March 10, and the seniors know that their time is precious between now and March 24, when the battle for a diploma will begin. The seniors all handed in their theses to Dean Remington on February 15.

Death invaded the ranks of the junior class of the college on February 6 and took Mrs. M. W. Stoner. She had been employed in the dispensary of Norris-town State Asylum and this was her first year in college. The Alpha Phi Society, of which she was an honorary member, passed suitable resolutions of respect to her memory.

The sponge market continues to be short of sheep's-wool stack, although some goods have been received from the Florida fishermen recently. Louden & Hill the other day got a consignment of Florida sheep's-wools, consisting of 123 bales. Mr. Louden stated that his advices were to the effect that prospects for more goods are not promising.

Since Bullock & Crenshaw determined to give up the patent medicine and sundries business there has been placed in the rear of the store a table on which these articles are displayed. On account

of the great variety of goods it was named the "Midway Pleasance." This name has stuck to it, and the term is generally used throughout the store.

The Ohio Club has for a decade been one of the strongest associations in college, and many of its members have carried home prizes to the Buckeye state. This year fifteen seniors have formed its membership. As the close of the term approaches the club is organized in the junior class. This was done last week by D. E. Brown and G. L. Kappes, officers of the club, and seventeen juniors were received as members.

The February pharmaceutical meeting was held in the college museum on the 26th of the month. Dr. H. W. Jayne read an instructive paper on "Crude Carbolic Acid." Joseph Crawford's paper on "Forestry at the Columbian Exposition" was listened to with close attention. Charles C. Manger read a paper on "Euparin—a crystalline principle from Eupatorium purpureum," and Lyman F. Keble, chemist for the Smith, Kline & French Company, spoke of "A Process for the Assay of Vinegar of Opium."

On February 9 the State College Sophs tried to prevent the freshmen from holding their annual banquet at Loch Haven. The freshmen anticipating such a move had chartered a car and executed a successful flank movement and then barricaded themselves in the car. Repeated attempts of the Sophs to gain admittance were fruitless. An embryo chemist, however, mounted the roof of the car and poured a large quantity of sulphur down the stove chimney. The lack of ventilation caused by the closed windows and ventilators resulted in the train officers having to run the car a mile or so from the station and out of reach of the sophomores in order to allow the ones inside an opportunity to recover from the stifling effects of the sulphur fumes. The freshmen had their dinner.

Dr. Harry C. Watt, Ph. D., has recently acquired possession of the building on the southwest corner of Broad and South Penn Square, the price paid being a large one. This is one of the most desirable locations in the city for a drug store. It is opposite Philadelphia's monument, a \$15,000,000 structure, which is not yet finished. It is near John Wanamaker's great store and on the line to the Pennsylvania Railroad depot, a square away. Dr. Watts has a drug store a few doors from the corner of Penn Square on Broad street, but as soon as his lease expires he will erect one of the handsomest office and drug store buildings in the city. When the new station of the Pennsylvania Railroad Company, at Broad and Market streets, is completed Dr. Watts is to have the drug store on the ground floor. The doctor is an enterprising druggist, and though he holds a diploma as a physician he does not prescribe, as he thinks a druggist should stick to the compounding of drugs.

The Louisiana Board of Pharmacy at its session in New Orleans, February 9th, issued certificates of registration to C. Goodwill, Monroe; and Emile Helman, C. D. Sauvenet, A. P. Schmitt, Simon Verburg; E. H. Walsdorf, J. S. J. Otto and A. C. Ereitak, of New Orleans. A number of candidates were also examined for both registered pharmacist and qualified assistant's certificates. The board will hold its next meeting during the first week in May.

DETROIT.

The recent visit of Senator McMillan to this city furnished an opportunity for several of the leading manufacturing perfumers of Detroit and nearby cities to call the attention of the Senator to several defects in the Wilson bill, affecting the perfume industry, with the hope that they might be remedied when the bill comes up for consideration in the Senate. An informal meeting was held, and a committee appointed to draw up a statement of facts regarding the manufacture of perfumes in the United States, and presenting views as to the proper tariff legislation. This report has been placed in the hands of the Michigan Senators as an expression of the views of the manufacturers of Michigan, a state which, by the way, ranks second in the United States in the production of perfumes. The Wilson bill as it now stands proposes a reduction of one-half the ad valorem duty on competing foreign product (Alcoholic perfumes), while the rate on imported raw material (Essence of pomades, essential oils) is to remain as at present. The proposed changes in the internal revenue laws also contemplate an increase in the tax on deodorized alcohol, so that the perfumers of the United States will be compelled to meet the competition which a decrease of tariff on foreign perfumes will produce, and at the same time receive no reduction in rates upon their raw material, pomades and oils, which are all imported, and be compelled, further, to pay a higher price for their alcohol. This petition, therefore, requests, preferences for amendments to the proposed bill being in the order named. First, that the rates on alcoholic perfumes shall remain as at present, and essence of pomades be admitted free of duty to offset the proposed increase on deodorized alcohol. Second, that the rate on alcoholic perfumes prevailing in 1888 be restored, increasing specific duty \$1 per gallon over present and proposed law. Third, that the existing tariff law be not changed, which will give the foreign manufacturer no increased advantage over us, except as the internal revenue tax on alcohol is raised above ninety cents a proof gallon. The manufacture of perfumes in bond (at reduced internal revenue tax) for domestic consumption, but not for export, was opposed as tending to discriminate against the smaller manufacturers, and the rebate of eighty-five cents per gallon on cologne spirits proposed in the brief lately presented to the Senate finance committee by the manufacturing perfumers as a body, was opposed on the ground that there was no possibility of obtaining it, and its consideration at present would endanger the prospect for obtaining equitable tariff rates; and such a measure would, at the outside, benefit but a few large buyers, and possibly prove a detriment to the smaller manufacturers.

Meloche Bros., druggists of Belding, report that the case brought against them by the Michigan Board of Pharmacy on a charge of conspiracy has been dismissed from the justice court of Ionia at the request of the prosecuting attorney, who became satisfied that the evidence produced was insufficient to warrant the conviction in the Circuit Court. They also give us the following outline of the case; the board, through information from Dr. J. E. Ferguson, Belding, swore out a warrant through its attorney, J. H. Hicox,

ST. LOUIS.

charging A. F. with impersonating his brother, H. N., at the Baginaw meeting January 13 and 14, 1891, and obtaining a certificate as a registered pharmacist by fraud. Witnesses were sworn to show that it was A. F. who was there, identifying him by his smoothly-shaven face and mustache. The defense proved an unquestionable alibi, showing that A. F. was in holding upon the dates mentioned, and that he wore a full beard. Questions as to the competency of H. N. were then brought forward. The secretary's books show that but one of the forty-three applicants examined at the time had a blither standing than had H. N.

An adjourned meeting of the retail druggists of the city was held in the Cowie building February 21 to further discuss the subject of advertising cut-rate prices. It was almost unanimously decided that each druggist should "work" his district and trade in the way he best saw fit. Chairman Allen took the opportunity to boom the local association, and asked all druggists present to meet with it at its next regular meeting, Wednesday, March 7.

W. A. Strong & Son, druggists, Reed City, were burned out February 22.

Frank E. Heath has purchased the drug stock of Geo. D. Lunn, Edmore.

Dr. Nelson Abbott, formerly of Lima, Ind., has bought out Druggist Leighton, Kalamazoo.

S. F. Fritzel, druggist, 4 and 6 Gratiot avenue, has been confined to the house with an attack of grip.

The wholesale drug establishment of Farand, Williams & Clark, at 32 and 34 Woodward avenue, was destroyed by fire Feb. 16, an extended account of which may be found on page 231.

A. F. Miller & Co., Swartz Creek, have been decorating and remodeling their store. The stock has been largely increased, and they report doing a splendid business.

C. E. Hollister, the proprietor of three well known north end drug stores, had the misfortune to severely sprain his ankle a few days ago when attempting to mount his bicycle. He now walks with a cane.

H. S. Sears, representative of Billings, Clapp & Co., Boston, favored the Era with a call February 22. He is on an extended business trip, visiting the trade in Detroit, Chicago, St. Louis and various other cities.

The mother of George Boehnlein, Williams, Davis, Brooks & Co.'s salesman, killed in the Harmonie Hall fire some time ago, has brought suit against the Star Accident Insurance Co. to recover the amount of the policy, \$5,000, issued on the life of her son. The company refuse to pay.

F. G. Aldworth, formerly of Scribner & Aldworth, Grand Rapids, will again represent John Wyeth & Bro., the Philadelphia pharmaceutical house, as traveling salesman in Wisconsin, Minnesota and South Dakota. Mr. Aldworth held a similar position with that firm before his engagement in the retail business.

If all reports be true, then the druggists of Manistee are no longer bothered with cutting prices on patent medicines. All of the druggists of that city, fifteen in number, have signed an agreement to that effect. If any member fails to live up to the agreement he will forfeit \$25, to be covered into the treasury of the Manistee Industrial Home.

St. Louis, February 22. The improvement in the volume of wholesale trade, which made itself felt about February 1st, has steadily strengthened until our wholesalers are inclined to the conviction that the worst has passed and that the spring will bring a return of business that will be very satisfactory.

The January meeting of the St. Louis Paint, Oil & Drug Club was held Thursday evening, the 18th. President Daugherty presided and there was an attendance of thirty-six persons. The Standard Varnish Company, Mr. F. T. McHenry, St. Louis representative, and the Cleveland Varnish Company, Mr. Clinton Huber, St. Louis manager, applied for membership to the association and were admitted. What is known as the Detroit plan of selling paris green was read to the club. Mr. Barstow moved that it be the sense of the meeting that it recommend the adoption of this plan to the members of this club who deal in paris green. The motion was carried. W. M. Schuyler read a witty paper on "Cranks," after which Rabbi Sale, of St. Louis, delivered an eloquent address on the single tax method of raising revenue. Messrs. Addington, John Dutro and Mr. Jacob Trisler also made short speeches in favor of the single tax. The meeting adjourned late, after a session of four and a half hours. The February meeting occurred on the evening of the 15th. There was a good attendance and the programme was of more than ordinary interest. Hon. Franklin Perlia, vice-president of the City Council, made an interesting address on "Municipal Government." Another topic discussed was "Restrictive State Taxes on Foreign Corporations." Messrs. H. S. Tuttle, N. H. Foster and Geo. D. Parker were present as a delegation from the Furniture Board of Trade, to hear the remarks of the members. The Paint Oil & Drug Club will appoint a committee to confer with other trade organizations in this city and elsewhere, and decide upon the course of action to be pursued with them, in some cases, almost prohibitory laws.

Henry Lazarus, traveling agent for the Zwietsusch Soda Water Company, of Milwaukee, had a disagreeable experience in St. Louis the other day, being locked up for sixty hours as a fugitive from justice, because a victim of mistaken identity. He was supposed to be H. J. Franch, wanted in Chicago for forgery, and so was arrested at his hotel and cast into the holdover. A detective came from Chicago, and thinking that an error had been made, telegraphed back for the man upon whom the check had been passed. Lazarus waited in jail until the man came and declared that the wrong man had been arrested, then he was released.

Louis Wetteroth, a young druggist about 22 years old, employed in the downtown pharmacy of A. G. Enderle, at the south west corner of Carr and Ninth streets, St. Louis as clerk, was accidentally shot by Leon Grossman, and died from the effects of the wound one hour later. The shooting took place in a small room in the rear part of the store, which is used by young Wetteroth as a sleeping room, and was the result of the careless handling of a revolver. Mr. Wetteroth had been employed by Mr. Enderle for three years. He was born in Millstadt, Ill.

The profession is still shocked over the

double murder committed by Dr. Arthur Duestrow at his palatial residence, 1721 South Compton avenue, last week. Although only 39 years old, Dr. Duestrow rounded up a rapid career of periodical indisposition with the slaying of his young wife and 3-year-old son in a drunken frenzy. Mrs. Duestrow lingered for four days, but her child was instantly killed. The millionaire murderer will plead "transitory frenzy" as his defense.

A branch store of the Monroe Drug Co. was destroyed by fire at Unionville, Mo.

E. E. Hollbrook has again established himself in the drug business at Chester, Ill.

Theo. Luter is now with J. P. Tierney, of the Laclède Pharmacy, Sixth and Chestnut.

Dr. Say, recently with J. P. Tierney, has opened an office and is practicing medicine.

The Marshall Medicine Co., of Kansas City, with a capital of \$10,000, is a new Missouri institution.

Cunningham & Son, pharmacists at Kankakee, Ill., have been succeeded by Bettourne & McVicker.

The Meyer Bros. Drug Co. have renewed the city's contract for drugs and medicines for the first three months of 1894.

The retail druggists are discussing the Detroit plan and paying the way to put it into operation in the interest of the trade.

Stock and fixtures of the pharmacy at Champaign, Ill., owned by the late H. C. Karher, has been purchased by Price & Sanford, two competent young men.

At the annual meeting of the stockholders of the Moffitt-West Drug Company the following were elected directors: Wm. F. Niedringhaus, J. S. Moffitt, C. H. West.

William Branch, recently with F. P. McAuliffe, has opened a new store corner of O'Fallon and Eleventh streets. He is a graduate of the St. Louis College of Pharmacy.

Dr. W. H. Brennan, who was removed from the position of Health Commissioner, is still pressing his \$50,000 damage suit against Mayor C. P. Walbridge. The Mayor has the best of it, however.

George Paulus will retire from service with R. Sassmann, corner of Park and Mississippi avenues, and prepare to open an elegant store in the south part of the city. He is having a handsome building erected for that purpose.

Thomas Layton, the Grand avenue druggist, duly returned from New York, where he went to attend the meeting of the Inter-State Retail Druggists' League. He expresses himself as being delighted with the work of the convention.

Professor Frank Hemm, lecturer on practical pharmacy in the St. Louis College of Pharmacy, has moved his South Broadway pharmacy across the street from his old stand to a palatial new store. His new place is one of the finest in the city.

V. B. S. Reber, the Carondelet druggist, is being urged by his friends to become a candidate for the Republican nomination for the State Senate in the South St. Louis district. Mr. Reber served in the Lower House several years ago with distinction.

The Omega Phi Society of the St. Louis College of Pharmacy is doing much beneficent work among the students. The officers are: William Pilkington, presi-

dent; Rudolph Fischer, vice-president; S. V. Brace, secretary; Miss M. Martin, treasurer.

The St. Louis Medical Society has adopted resolutions of condolence and sympathy upon the death of Dr. P. J. Lingensfelder, one of the pioneer members of the society, who died on ship-board while on his way home from Europe.

There was a conference a few days ago between representative wholesalers and retailers to determine where the wholesalers stood on the Detroit plan, and the meeting was very satisfactory to the retailers. The wholesalers were found to be generally in favor of it.

The Women's Christian Temperance Union is after John Taylor, who has a drug store at Golden City, Mo. A committee of women called and demanded to see his prescription file, but he refused the request. The women will ask the court to compel him to permit them to see it.

Dr. Helme Marks, superintendent of the St. Louis City Hospital, regards subphosphate of strychnine, with which he has been experimenting, as a practical remedy for morphine poisoning. He is not prepared to say anything about the value of permanganate of potash, as he has not yet had occasion to use it.

The question of handling patent medicines exclusively through wholesale drug houses is attracting much attention, and a canvass of a majority of the retailers shows them to be in favor of handling only those proprietary medicines whose manufacturers or agents sell to wholesale druggists and ignore such trades as grocers and dry goods, etc.

Owing to the unfair and unreliable manner in which some of the city newspapers have been reporting meetings of the St. Louis Medical Society, there is a disposition to exclude reporters in the future.

W. S. Johnson, of Henderson, Ky., whose store was burned recently, was in St. Louis last week purchasing new fixtures.

The Lambert Pharmaceutical Company has brought suit against two representative pharmacists of Chicago, out of 161, for selling a substitute for the company's preparation "Listerine." One pharmacist has also been enjoined by the Federal Court from selling or dispensing any article whatever as Listerine, except that manufactured by the Lambert Pharmaceutical Company, while 73 other pharmacists have accepted the privilege of signing an affidavit that they will cease to substitute and will keep in stock a sufficient quantity of Lambert's Listerine to supply their trade.

Dr. William Frye, of Sedalia, Mo., claims to have been experimenting with permanganate of potash, heralded as an antidote for morphine poisoning. He reports that a dog was given five hypodermic injections of one and one-half grains of morphine at intervals of about fifteen minutes. This was equivalent to fifteen grains introduced into the stomach. In about two and one-half hours the dog was dead to all appearances. The attempt to restore it to life was then made. Three hypodermic injections of permanganate of potash of one grain each, in a dram of water, were given ten minutes apart. The first injection caused the dog in about fifteen minutes to prick up his ears when spoken to. At the second he was able to wag his tail, and the third enabled him to walk around the room.

CINCINNATI.

Cincinnati, O., February 22.—Frank C. Grote, the well-known wholesale druggist, had a harrowing experience a few days ago. He went into a restaurant in the bottoms and ordered some oatmeal and milk with his noon-day meal. Shortly afterward Mr. Grote was seized with retching pains in the abdomen and had to be taken home. Dr. Dunham was called in and stated that Mr. Grote's serious illness was caused by ptomaines in the milk. For a time his life was despaired of, but he has been improving slowly and is now considered out of danger.

Frank Koeng is back in his brother's store again after a severe touch of the grip.

Hugo Luebker, druggist at Clark street and Freeman avenue, has just been elected a director of the Lincoln Building Association.

Will Wagner, the senior clerk at Weatherhead's, is back from a trip to Texas. He was in business for quite a time at Austin, Tex.

Joseph Dehner, brother of the druggist at Seventh and Vine, has left his position in the west end, and can now be found at his brother's store.

Charley Stammel, the druggist at Elm and Findlay streets, is now in line, and is studiously at work diving into the mysteries of anatomy and kindred studies.

It was rumored that Louis Kusnick, the pharmacist at Weatherhead's, would emulate the example of Voss, but Louis makes a strenuous denial that he is to become a benedict.

Robert Wodtke is again behind the prescription case at John C. Ots & Co.'s store after an absence of several months spent in going from one store to another in the west end.

Louis Klayer, the druggist at Ninth and Elm, has given a contract for having his store refrescoed by a New York artist. The design is one of the nicest ever seen in this city.

William Simonson, of the drug firm of Werner & Simonson, is doing some special work for the city, and the result, especially in some milk cases, is being awaited with much interest.

Al Boehmer, the pharmacist at Eighth and Central avenue, talks of starting a branch store across the river, either in Covington or Newport, Ky. He inspected several places a few days ago.

Dr. Louis Sauer had his hair cut the other day, and when he got back to his store, his mastiff didn't know him, and had it not been for the interposition of the clerk, would have bitten the clever doctor-druggist.

Harry Streithorst, the young pharmacist who recently had his watch stolen at a reception, has received information from the police that his timepiece has been recovered in St. Louis, where the thief is in custody.

Ed Voss, the young pharmacist who controls stores at Twelfth and Vine and Wade and Baymiller, has resigned from the bachelors' club of the west end. Ed will soon lead to the altar one of the fairest society belles of the Queen.

Frank P. Deringer, the young druggist at Brown and McMicker avenue, is putting in his spare time studying medicine. Frank is a fresh air fiend, and he says he can't satisfy his appetite as long as he juggles pills and dabbles with powders.

The smiling countenance of Dr. L. R. Bramble, the Broadway doctor, is again seen on the streets. The doctor has had a collar and elbow wrestling match with pneumonia.

L. S. Shreck, who recently sold out his business, has opened an elegant drug store at Warner and Wheeler streets in the building formerly occupied by Druggist Charles Wuest.

John Fratz, Jr., will conduct the drug store at George street and Kenyon avenue, which was made famous by his father. The place is to be remodeled as soon as warm weather arrives.

Ed Bell, who formerly clerked for E. A. Keeshan, and was subsequently in partnership with Ed Gray at Fifth and Main, is now in charge of one of Woodbury's facial soap advertising wagons.

Wilmot Hall has started on a tour of the prominent southern cities for his health. All the boys hope Wilmot will find lots of health, as he is one of the most popular pharmacists in the city.

Louis C. Lippert, formerly of Ludlow, Ky., has opened an elegant pharmacy in the thriving suburb of College Hill. The new store is fitted up in modern style and resembles an up-to-date downtown pharmacy.

A well-known local physician will soon open a fine drug store in Camp Washington. The store room has been selected and the fixtures have been purchased. The store will be larger than any we now have in the suburbs.

A few days ago a Race street druggist gave a customer the wrong prescription and there came near being crepe on the door of a down-town clothing establishment. The mistake, it is claimed, was caused by a similarity in names.

George M. Smyth, the clever traveling salesman for the John M. Maris Company, of Philadelphia, was here for two days this week. Our Quaker City brother says he likes the druggists here on account of their true southern hospitality.

Dr. Charles Renkert has sold his drug store at Glendale and disposed of his interest in the Avondale store to L. N. Beruk, his erstwhile partner. The doctor will now go abroad, and upon his return will give his sole attention to the practice of medicine.

A. J. Doering, who has conducted the well-known Pike street store for a score or more years, has remodeled his store and will completely refit the place before the end of the next week. The new fixtures will be made of ash and have been ordered from Bangs.

The Board of Trustees of the Cincinnati College of Pharmacy will hold a meeting to-morrow to devise means of improving the course of study for next term. The faculty will also be decided on and a number of changes in the course of study will doubtless be made.

John Fallon, the popular druggist at Fifth and Locke streets, now sports an elegant new yachting cap, and all the girls in the vicinity are constantly running to his pharmacy for chewing gum and postage stamps. John is the Beau Brummel of the east end.

Dr. L. A. Haber, the veteran druggist at No. 486 East Third street, is now as happy as a school boy with a new pair of red top boots. The doctor has just fitted up his store in elegant style and the appearance of the place speaks well for his exquisite taste and judgment.

John Keeshan, the aged druggist at Sixth and Walnut, has just purchased a soda water apparatus, which now adorns the center of his store. The store-room is to have a new glass front. Better late than never is the motto of "Uncle John."

Mrs. Albert Vogeler, wife of the clever junior member of the Stein-Vogeler Drug Company, is confined at the Good Samaritan Hospital with a severe attack of nervous prostration. Mrs. Vogeler's ailment was brought on by too close application to musical studies.

Joseph Fuldner, the popular Avondale druggist, is confined to his home with a severe case of pneumonia. Joe is being attended by Dr. E. W. Mitchell, who says the druggist will pull through if he takes care of himself and lets the drug store move along without his assistance for a few weeks.

Ed Burdall, the Main street druggist and member of the Board of Legislation from the sixth ward, is now paying considerable attention to outside matters. He claims, however, that he will allow his clerk to resign or retire from the city council, as he claims business and politics do not go hand in hand.

Henry Gradel, who made the cut-rate drug store at Allison and Walnut streets famous, will soon open a new store at Fossilick and Highland avenues, Mt. Auburn. An elegant building is being erected for Mr. Gradel and he is personally superintending the construction of the first story.

The date of the annual meeting of the Ohio Pharmaceutical Association in this city has been changed to May 23, 29 and 30. The cause of this change was a conflict with the May Festival, which the druggists don't care "to play agin." The local committee have received word from a large number of manufacturers that they will be on hand with exhibits.

Yesterday morning a well clad man entered E. P. Dehner's drug store at Seventh and Vine streets and tried to rob the cash register. Val Lederer, the soda boy, was too quick for the robber, however, and the glistening barrel of a revolver caused cold chills to crawl over the fellow and he took the "screw number" before the arrival of the police.

On Tuesday last twenty-five barrels of cement were dumped on the pavement in front of Hager's drug store, near the Mohawk bridge. "Doc" Hager was afraid it might rain on the cement before it could be shoveled away, and the occupants of the store would then be buried, as there is no rear entrance. The entire front of the store was demolished, and the mules that were hitched to the wagon had lots of fun trying to decipher the Latin signs in the pharmacy.

The automatic fire sprinkler in the building of Noyes Bros. & Cutler, of St. Paul, sprung a leak January 28th and caused some damage to goods in the vicinity of the break.

Stuart, Maxwell & Carpenter, of Troy, Pa., have purchased the stores of Stuart & Maxwell and D. F. Pomeroy and will consolidate the two, moving the stocks into the store originally occupied by Senator B. B. Mitchell.

J. R. Hofflin & Co., of Minneapolis, Minn., are succeeded by the corporation of the Hofflin-Thompson Drug Co., with a capital stock of \$35,000.

CLEVELAND.

Cleveland, February 21. Chemist Smith, of Case School of Applied Science, has rendered a remarkable decision in a food-inspection case, namely: "Whosoever feeds sugar or syrup to bees and sells the honey made therefrom is as guilty of violating the law as though the sugar were mixed in with a spoon."

The Kelpier Pharmacy, on Lorain street, is for sale. Ludwik Kelpier, the owner, has grown wealthy in other pursuits, and is looking for a business less onerous than a druggist's.

E. A. Schellenstrager is the possessor of a curious old German recipe based on the superstitious beliefs of a former age. To cure fever, the patient must seize a handful of rye or corn and bind his hand up, covering himself warmly until perspiration is induced. When the grain thus becomes moist it must be planted in a pot of earth near the bedside, and as it sprouts and grows the sick person will recover. To cure toothache a sharp stick must be cut from the trunk of a young willow tree. The gum is to be punctured with this stick until the blood flows. Then the stick must be placed back in the tree and the trunk bound with cloth and waxed. If such care is taken that the tree lives, then the toothache is cured forever.

H. W. Stecher is reported better. Cleveland is to have a food and drug exhibition in May.

Franz Kelpier has been trimmed down by a severe case of grip. C. E. Hildreth, of 1228 Euclid avenue, has a fine winter soda trade.

The plant of the Jupiter Oil Co., at Dunkirk, was sold by the sheriff. Cleveland has a successful female chemist. Her name is Mrs. Ella Shove.

Finch Bros. & Co.'s oil business in Sandusky County is in the hands of a receiver.

S. M. Strong has been elected a trustee of the Cleveland Homeopathic Hospital Society.

Francis C. Keith, the manufacturer of Marshall's Catarrh Snuff, reports great success.

P. L. Dumbleton's drug store at Augustus is now run under the name of Dumbleton & Pottori.

The lined oil works of Pope & Co., Dayton, have been damaged by fire to the extent of \$15,000.

Mr. McDowell, of McDowell Bros., Medina druggists, was a visitor to the Cleveland market last week.

Adolph Hillhardt, the veteran druggist of Upper Sandusky, O., has been appointed consul to Moscow, Russia.

Sheriff Ryan, many years since, was a Newburg druggist. His business sign still marks the store he then occupied.

The Cleveland Medical Society is to have headquarters in the new Chamber of Commerce building and take \$10,000 worth of stock.

Many of our moneyed retailers are speculating in whiskey. If they hold it long enough a quick grip-cure may ultimately be effected.

The Red Seal Oil Co., of Missouri, sued the stockholders of the American Seed Oil Co. in local courts to secure payment of judgment for \$50.

Charles M. Cook, traveling for a Detroit baking powder house, attempted suicide at Columbus. The firm's financial troubles are given as the motive.

At the Hollenden, February 7, a banquet was given by the faculties of the Cleveland University of Medicine and Surgery.

Lederer's new store, corner Brownell and Prospect streets, ought to be a winner. The location is excellent from any standpoint.

The Crow & Whitmarsh cut-rate cuckoo remains remarkably quiet these days. It must have eaten crow and stolen Whitmarsh's nestegg.

George D. Zirker, formerly of Frieseman & Zirker, has purchased the bankrupt business of Wm. S. Furze, formerly Furze & Wilnot.

In the big Wapakoneta conflagration February 9 Moss & Kayser's drug store was completely destroyed. Loss about \$8,000; insurance \$1,000.

The Girshaw Lined Oil Co.'s plant at Warren caught fire and 40,000 gallons of oil were consumed. The plant cost \$200,000, and was insured for \$100,000.

The term of 1882-'84 of the Cleveland School of Pharmacy closes March 30. On April 10 a special botany course begins and will be continued to June 12.

Fred Felt, the Wellington ex-druggist, is now up for perjury in connection with illegal whiskey selling. Fred's defense is disclaiming making the sales personally.

A young man who will some day appear as a luminous figure in the pharmaceutical world is W. A. Palmer, Strong, Cobb & Co.'s road trade index and correspondent.

The Mayell-Hopp Co., who arc said to have the largest prescription patronage in the city, note a marked falling off of late. Even the rich seem to curtail doctor bills.

Joseph Fell, instructor in chemistry and physics at the Cleveland School of Pharmacy, narrowly escaped serious injury while experimenting with phosphorus recently.

New drug stores have been opened in the following towns: Canal Dover, S. F. Naylor; Grafton, W. F. Ashley; Oberlin, H. F. Smith; New London, D. A. Wood; Akron, C. Parlette.

Examinations of the C. S. P. will be held as follows: March 25, senior materia medica; March 27, junior pharmacy; March 28, senior chemistry; March 29, junior chemistry.

Dr. A. Dunlap, a physician of international reputation, died at Springfield. He was a delegate from the American Medical Association to the world's congress at London, Eng., in 1881.

Christie H. Schoenhut, manager of Strong, Cobb & Co.'s retail pharmacy, tells a gruesome tale of a Lakewood robbery in which his neighbor figures. The case is now in the courts.

The Cleveland Commercial Co., on Merwin street, of which M. A. Bradley is president, have become prominently identified with drugs and paints. They deal in full package lots only.

In many eastern cities druggists have gone into a sort of improvised real estate business. While the idea has not as yet struck here, many of our retailers are looking about for some shie line occupation to kill the dull times ennui.

J. R. Davis is the successor of H. L. Hogue at Belmont; T. A. Wagner succeeds W. K. Hughes at Berlin Center; the Moore Drug Co. succeeds C. A. Moore at Uhrichsville; E. W. Saltzman succeeds F. L. Berry at West Salem; E. D. Lynn succeeds Lynn Bros. at Canfield.

Cleveland is still the chewing gum center of the world. The industry was started with a barrel of borrowed sugar by its practical founder, W. J. White, the now millionaire congressman.

Charles A. Godman, Strong, Cobb & Co.'s popular outdoor city salesman, will be succeeded by Frank G. Dorn, of the city order department. Mr. Godman will be given a suitable indoor position.

Dr. H. W. Simons died of heart disease at his drug store in Conneaut February 19. He had been in business there for thirty years. His son, and probably his daughter, who is now studying medicine in Cincinnati, will continue the business.

About two score of local retailers, members of the C. P. A., enjoyed a banquet and stag social at the Forest City House February 20. After the love feast was over a number of the German members adjourned for a "phillistoesen kneip-abend."

Soap men claim that Chicago and Cleveland offer the best retail opportunities for their product. That's not strange. The two cities vie with each other in the production of soot and smoke of the most adherent quality. In dirt they rule the universe.

Jack H. Vance, for long years connected with Geo. A. Kelley & Co., of Pittsburg, is now traveling for Strong, Cobb & Co. Jack is very popular, highly rated as a salesman and a good, clever fellow all round. The Thirteen Club will add him to its bunch of hits.

A bill to offset the Avery bill has been introduced by Representative McBride. Its provisions are entirely non-partisan and liberal, barring none but non-composita candidates, one might say. Like the Avery bill, it provides for a state board of medical examiners to be appointed by the governor, with the consent of the Senate. The lavish liberality of the bill is likely to swear up a mountain of killing amendments and erasures, to say nothing of the bitter opposition of the Averyites. Besides, the amended Moss-grove non-partisan bill has passed the Senate without a dissenting vote.

Many associate members of the N. W. D. A. have become disgruntled because the annual dues have been increased from \$10 to \$25, and are resigning their membership. It has gone abroad that even regular members are leaving the association on that account, but that is not so. It is apprehended that the desertions will not cease until a discriminating rate is established for associate members. An effort was made to interview Treasurer S. M. Strong in regard to the matter, but that gentleman is spending a few weeks in the east. The information given out above is from a reliable source, however.

Customer (excited)—"I want a brush, quick."

John Jedleka—"What kind of a brush?"
"A brush with you—you—what do you mean by that?"

The customer laid a rag of paper on the counter. John began reading and blushed. It was later explained that the customer had sent his girl with an order reading: "I am still waiting for that q. w. Send it and Ill pay you to-morrow morning." John knew his customer to be a dead-beat, and, seizing a pen, changed the q. w. to read "quit waiting," struck the other words out and sent the girl back with it. Well, the fellow got neither quinine, whisky nor a brush, but made a forcible exit.

LOUISVILLE.

Louisville, Ky., February 22.—Secretary Robert J. Frick, of the Interstate League, is back from the New York convention and in a state of enthusiasm respecting the work outlined by the organization. Mr. Frick declares it the most successful ever yet held by the league, each association sending one or more delegates, making, in all, a body of men representing about ten thousand retail druggists. I had an interview with the secretary and he declares that the increased interest in the affairs of the league is gratifying to the officers. Mr. Frick states that he is in receipt of letters from different sections of the country showing a readiness to join.

"At the convention," said the secretary, "two or three plans for future work were proposed and the officers will go to work at once and put them into execution as rapidly as possible. We hope by May next, when the annual meeting takes place, to have a very encouraging increase and many gratifying reports. I heartily agree with the president of the league that the sale of proprietary medicines must not be in too large a measure dependent upon good faith. The agreement must be a practical business measure appealing to every party interested and, to be successful, it need not be said that it must have the absolute support of all concerned. The plan adopted by the league seems to contain all these essentials, although it differs materially from the compromise plan of the N. W. D. A. The jobbers of Louisville will, I think, be glad to hold up their end, as it will be to their own advantage. If the manufacturers refuse to accept orders for full quantities with rebate discount except from jobbers, this will cut off the smaller or club sales which have been customary. In many cases druggists send on orders together and divide the goods upon their return. The abolition of this practice will certainly be an advantage to the jobber."

Mr. Frick is, in fact, in high spirits as to the future outlook. He has all through taken great interest in the movement to secure some agreement by which the invasion of the retailer's territory may be stopped and feels that the time is now at hand when all hopes will be realized. Indeed, it may be said that all the druggists of Louisville have taken an active part in the discussion of this question, if not abroad, certainly at home. Through the instrumentality of the Botanical Club, the necessity for earnest co-operation on the part of every dealer has been impressed. If the associations all over the country were as determined in their support as the Botanical Club, there could hardly be complaint that the trade lacked interest. The druggists also feel that during the prevailing depression, it is of more than ordinary importance that vigorous measures of self-protection should be adopted. Sales have fallen off to a large extent locally, as elsewhere, if reports are to be relied upon, and the drug men have been compelled to stop up all leaks in order to keep business on an easy footing.

A meeting was recently held by the druggists of the city to take action to prevent the passage of a bill pending before the State Senate allowing doctors to compound prescriptions and run drug stores without first undergoing an exam-

ination. Dr. Wiley Rogers, Dr. J. W. Fowler, E. Y. Johnson, H. J. Snyder, Addison Dimmit, Fred C. Miller, Jos. Moore, A. J. Schoettlin, George Zubrod and C. Tafel were among the prominent representatives of the trade. Dr. Fowler was selected to act as chairman and addresses were delivered by several of the dealers present. The meeting resulted in the selection of a committee consisting of Dr. Fowler and Dr. Rogers to go to Frankfort and, if possible, defeat the bill through the assistance of the Louisville members of the Legislature. Messrs. Snyder and Dimmit expressed their willingness to respond to a call from the committee if more workers were needed. From the standpoint of the trade, the Legislature would labor under a grievous error in presuming that a medical education fits a man for compounding prescriptions and running a drug store. It could hardly be argued with success that a course in pharmacy prepares one for practicing medicine and the druggists feel that a great wrong would be perpetrated in allowing a diploma from a medical college to operate as a diploma from a pharmaceutical institution. It cannot be denied that there are physicians in Louisville and in Kentucky who are practical pharmacists, many of them, indeed, having graduated from the drug business into the medical profession, but these are exceptional cases and the injustice arises in admitting all physicians from the simple fact that they are eligible to practice medicine. The committee goes to Frankfort with the fortification of right, and if they do not succeed in relegating the bill to the waste basket of the General Assembly it will be because of the stupidity of the solons and not from any lack of ability on the part of the gentlemen who go to make it up. Without intentional disrespect to the august body which controls the destinies of the old commonwealth, it certainly does look as though the Louisville druggists have a hard time in keeping it in line. But for the timely interference of the leaders of the trade here, many unjust and wholly uncalled for measures would have been passed. In matters pertaining to the law the Legislature is all right and in matters pertaining to the business prosperity of the State the same may be said, but a technical knowledge of pharmaceutical requirements is in nearly every case requisite to the passage of laws affecting those interests, and as the General Assembly does not seem to be well supplied with druggists in its membership, it has been on the verge of making some very awkward mistakes—such mistakes as might be expected from a body of pharmacists who proposed to revise the code of civil practice, if such a broad illustration may be used. It would not be a bad idea to call in the services of the State Board of Pharmacy in matters pertaining to the trade, and especially in regard to technical regulations concerning it. The recently passed poison law may be elted as exemplifying the advisability of such a course. But all things considered, the druggists have no bone to pick with the Legislature so far as their treatment is concerned. In every matter in which they have expressed a desire to be heard, that hearing has been not only respectfully but cheerfully given and not infrequently the lawmakers have been deterred from unwise action as the result of their periodical lectures on pharmacy.

At the recent annual meeting of the Botanical Club the following officers were elected: Addison Dimmitt, president; William Tafel, vice-president; Henry Gans, recording secretary; William Zibrod, treasurer; E. A. Bell, financial secretary. The committees were left to the president and have not yet been announced. The club finds a good executive officer in Mr. Dimmitt. He is an active and a progressive man and one who has the best interests of the club and of the trade at heart. At the meeting President Dimmitt reported encouragingly upon the outlook and gave a resume of the general work of the club for the past year, which demonstrated its usefulness in the field which it covers. The committees also made reports which reflected credit upon their work.

In an interview published in one of the Cincinnati papers, Col. Thomas H. Sherry, of this city, is credited with making the assertion that distillers of the better class of whiskeys in Pennsylvania and Kentucky would attempt to secure relief by asking Congress to establish warehouses in New York City where tax-overdue whiskey might be stored, instead of sending it to Germany. It seems that all the whiskey men of Louisville are not in favor of this plan. George W. Swearingen declares that the relief to the whiskey men might be compared to the relief afforded a condemned prisoner by the commutation of his sentence from death to imprisonment for life.

"If such a warehouse is to be established," says Mr. Swearingen, "it should be in Louisville by all means. It would be more satisfactory to the trade as well as to the dealers. Louisville is more central and by the establishment of such a warehouse here, if it is to be established at all, much expense would be saved. It certainly would be foolish to place the warehouse in New York when a point much more desirable and central could be selected."

The passage of the bill in the Lower House of Congress increasing the tax on whiskey ten cents a gallon has called forth a circular letter from the American Distillers' and Wholesale Liquor Dealers' Association, through its president, Mr. J. B. Wathen, of this city, and a copy of the letter has been sent to every member of the association. It requests the recipient to write immediately to both United States Senators and Congressmen protesting against the increase of the tax and giving reasons for such protest.

Charles Greer has organized a stock company for the sale of his medicines and the concern has added several new preparations to the list.

The new secretary of the Botanical Club is a popular young druggist and he will doubtless keep the members well posted on current happenings of interest to them.

Virgil Smith, for several years a traveling salesman for Arthur Peter & Co., has accepted a position with Renz & Henry as southern representative. It is understood that in future this old drug house will have no men on the road.

The druggists report business on the mend and look forward expectantly to the opening of the spring trade. The financial conditions in Louisville are brighter than for some time and there is a feeling that recuperative agencies are actively at work.

KANSAS CITY.

Kansas City, February 22.—The druggists of this city have been doing considerable business with the criminal court during the past month. About Christmas time the county prosecutor and his satellites, the constables, plotted to trap the druggists selling liquor in less than three-gallon quantities, without having licenses to retail. Some forty druggists were arrested and were taken before W. H. Browne, a justice of the peace notorious as a fee-grabber. There they were told that three charges had been filed against each and were advised to plead guilty and to be fined only \$1 in each case. One or two did so and found that the costs amounted to \$70. The others determined to fight the cases, knowing that if they did not the fee-grabbers would levy this species of blackmail without limit. When one case was won by the druggists, as told in the Era, the prosecutor took the matter before the grand jury and that body returned two indictments against each of the following druggists: W. H. Coover, F. M. Robb, J. L. Carnahan, Dr. E. S. Ragsdale, A. A. Dunton, Frank D. Palmer, Fred Crampton, P. D. French, George F. Berry, J. A. Gallagher, W. M. Ferguson, G. W. Rockwell, clerk for James T. Young, Algot Bjostrom, David Walker.

J. L. Carnahan was the first one tried. Judge Wofford instructed the jury that they must consider only the law and the evidence and that the subject of fee-grabbing must not be considered. Carnahan went on the stand and admitted that he had sold whiskey by the drink to the deputy constables, but avowed that they pretended to be ill. The jury found him guilty and fixed his punishment at \$100. He appealed. P. D. French was then tried and acquitted. The judge instructed that the proprietor was responsible for the acts of his subordinates, but the jury considered the fact that the liquor was sold by a clerk and so acquitted French. The other cases have been continued. The prosecutions have in a measure put a stop to the practices of druggists who in the past were willing to make their stores tipping houses. The law allows liquors to be sold on a physician's prescription or for medicinal, art, or scientific or mechanical purposes, and it is an easy matter for the druggists to keep within the law in doing a legitimate business.

Druggists in the liquor business in Kansas and Missouri are having a hard time of it just now. At Belleville, in the prohibition state, the women have begun a crusade against the liquor-selling druggists and are trying to prevent signers to the druggists' permits. They are likely to make it a dry town, as the law requires twenty-five women petitioners in each precinct before the permit can be issued. The women of Golden City, Mo., visited Druggist John Taylor a few days ago and requested him to show them his prescription files. They were seeking evidence as to the sale of liquors. He refused their demand and they left to interview the Mayor.

Governor Llewelling, of Kansas, has issued a pardon to L. R. Yates, C. V. Pyle and J. W. Pottenger, prominent druggists of Hiawatha, who were fined in the District Court of Brown county for violating the prohibition law, as told in the Era. The Hiawatha Law and Order League has set about taking legal steps to set the pardon aside, and has

employed special counsel for that purpose.

The death of A. M. Beardsley at Council Bluffs recently points a moral to all druggists. Mr. Beardsley had been a druggist in that city for twenty-one years and in that time had abundant opportunity to learn that carefulness must be the druggist's strongest characteristic. He was feeling ill one evening and so picking up a measuring glass he poured into it a little whiskey, which he drank. He was found dead in his bed the next morning, and an investigation showed that the beaker from which the whiskey was taken had been used to measure a poison and had not been cleaned. Mr. Beardsley's sad death certainly points a lesson in carefulness.

The usual monthly mistake where poison is taken instead of medicine or liquor because not in a distinguishing container comes this time from Joplin, Mo., where James Kirby, an old citizen, asked his little daughter to hand him a bottle of brandy, and she picked up instead a bottle of carbolic acid. The two bottles were alike, and Mr. Kirby took a draught of the contents before discovering the mistake. He died within an hour.

The druggists of Kansas City have again taken up their old fight against the extortion of the telephone monopoly. They are being aided by the physicians and by many of the merchants. Since the telephone patents have expired the Missouri and Kansas Telephone Company, which owns all the wires in this part of the country, is seeking a franchise for underground wires. This franchise, if granted, will only prolong the life of the monopoly, and the ordinance granting it has passed the lower house of the City Council. The druggists and others called a mass meeting at Turner Hall to discuss the matter and demand a clause in the franchise giving cheaper rates. C. E. Torcoran and G. Howard Willett spoke on behalf of the Kansas City Pharmaceutical Association.

J. C. Nidetzky was here recently representing F. Weber & Co., of St. Louis.

Daniel Whittiger has moved back to his old store at the corner of Eighteenth and Campbell streets.

C. E. White was here a few days ago representing the Maritime Manufacturing Company, of New York.

C. B. Gorm has bought Archibald L. Soper's store at the corner of Eighteenth street and Prospect avenue.

Mrs. Elizabeth Hicks has been made cashier in Schoen's new prescription drug store in the Rialto building.

George W. Houser, of Mine Latotte, Mo., has sold to Charles G. Houser, the drug store at No. 217 Indiana avenue, in this city.

H. H. Gregory is now conducting the pharmacy at 119 West Twenty-fourth street, succeeding Mrs. Georgiana C. Heathfield.

J. C. Fisher was in Kansas City a few days ago selling bottles and druggists' glassware for Dean, Foster & Co., of Chicago.

F. V. Perry, western agent for Johnson & Johnson, was in Kansas City a few days ago visiting the trade. He makes his headquarters in Chicago.

A dividend of 5 per cent has been allowed to the creditors of the Marshall Chemical Company by S. S. Winn, the assignee. It is now payable.

Mr. Von Hook has bought Harry Lee's pharmacy at the corner of Twelfth street and Indiana avenue.

The Salford Chemical Company, of St. Louis, has filed articles of incorporation with a paid up capital stock of \$50,000.

Druggist O. W. Krueger has gone to St. Louis to visit his aged father, W. E. Krueger, a druggist at No. 2837 Chouteau avenue, who is ill.

Frank Johnson will open a drug store in the building at the southeast corner of Independence and Elmwood avenues, where W. C. Lemon's drug store was burned out in January.

W. M. Robb, manager of Graham's pharmacy, at the corner of Twelfth and Main streets, fell from a cable car a few days ago and sprained his ankle. He will be confined to his room for several weeks.

A. B. Beck will soon open a drug store at the southwest corner of Sixth and Main streets. He is a member of the firm of Beck & Swearingin, who have long had a drug store at the corner of Sixth and Walnut streets.

Four trunks filled with smuggled opium were seized at Phoenix, Arizona, a few days ago. The narcotic was in the possession of Chang Some Chinese Company, and is supposed to have been smuggled in at Portland, Ore.

Pierre B. Davis, traveling agent for John Wyeth & Bro., of Philadelphia, spent a few days here recently. Mr. Davis is famous in other lines than as a salesman. At the meeting of the State Pharmaceutical Association at Excelsior Springs last June he won a diamond watch charm for climbing the greased pole.

The Casco Manufacturing Company was incorporated last week with a capital stock of \$20,000, fully paid up. The stock is divided into two hundred shares. S. J. Fitzhugh owns ten, F. V. Fitzhugh fifty, and S. J. Fitzhugh 139 as trustee, and Benjamin W. Livers one share. The company will manufacture druggists' and grocers' sundries.

Albert B. Zweifel, formerly at the corner of Seventeenth and Madison streets, has bought Joseph Brinkley's drug store at the corner of Twenty-first and Olive streets, and A. B. Soper has bought Brinkley's other branch store at the corner of Eighteenth and Olive streets. Mr. Brinkley will continue to run his main store at 2104 Vine street.

The Star Iron Company, of Indiana, has a suit pending against the Dr. Harter Medicine Company, of St. Louis, on breach of contract. The claim is that on February 15, 1892, the Dr. Harter Medicine Company contracted with the Star Iron Company for the construction of an iron tower at some point in St. Louis to be selected by the medicine company; the tower was to be 177 feet high, with elevator and steps; in consideration of which construction within four months the medicine company was to pay the iron company \$1,200. The Star Iron Tower Company claims to have made the tower in Fort Wayne, Ind., and shipped it to St. Louis, but charges that the medicine company has persistently refused to receive and pay for it. The answer of the Harter Medicine Company just filed enters a general denial of the allegations, and states that the tower for which order was given was never constructed in such a way that it was practical.

DENVER, COL.

Denver, February 23.—One of the most important features of last month was the banquet held on the 13th by the enterprising and comparatively young association known as the Denver Pharmaceutical Association. Preceding the banquet was a short business meeting, with discussion of trade interests, etc., and with the good cheer which followed the members present felt more like brothers than antagonists. C. M. Ford acted in the capacity of toastmaster for the evening. Among those present were: Charles S. Kilne, J. A. Uhlund, F. M. Hall, C. D. Barnes, C. M. Graves, W. A. Hover, G. W. Riethmann, J. W. Fleming, F. P. Miller, Frank P. Angell, John Kochan, John Stromberg, W. S. Haswell, S. G. Canfield, E. L. Scholtz, Charles M. Ford, C. Beukma, H. W. Grebe, W. W. Berteman and A. J. McAllister. This association (organized in 1885) has as its objects the maintaining of prices and the fostering of the pharmacy law (which was enacted in 1886), and as an association has met with a success in all its efforts that may well be envied by the druggists of other localities where the cutter is the bane of the druggist's life. Recently several members were arrested for the illegal sale of liquor. The cases were promptly taken up by the association, and it was proven that the sales were legitimate. Although there exists no well-defined law governing the druggist's sales, by the efforts of the association a legal precedent has been established. The funeral of the wife of member C. S. Prowett was attended by the association in a body. They also presented a beautiful floral wreath. Resolutions of sympathy were passed and tendered to Mr. Prowett.

Among business items and changes may be mentioned the following: George C. Starke, Jr., bought H. Counter & Co.'s store, Mr. Counter having retired from the business. O. J. Allen has moved his store from South Tremont and West Third avenue to South Ninth street and Tenth avenue. Mr. Allen is manager of the Boston Pharmacy, and will continue in this capacity, while his brother, A. H. Allen, will manage the South Ninth street store.

Frank N. Rogers, with the Scholtz Drug Co., has resigned.

H. Joe Ward, Colorado Springs, will be with Jackson & Co. about March 1.

E. L. Gallagher has opened a new store on Golden avenue, of which he will take charge personally.

The store belonging to Frank L. Church, deceased, Colorado Springs, has been sold to W. L. Fehlinger.

N. L. Traver has opened a new store at 500 Eighteenth avenue. This store was formerly occupied by O. F. Dana.

Frank C. Seaman bought K. Ramsey's "Pioneer" pharmacy on South Broadway. Patrick Carns bought out D. M. Titus, of 601 Santa Fe avenue.

The smiling countenance of W. G. Taylor, with Morrison, Plummer & Co., is to be seen here, and no doubt welcomed as usual throughout the state.

F. H. Arcularius, of Colorado Springs, secretary of the state board, has been confined to his bed for several weeks, but is showing signs of recovery.

F. E. Saunders bought out D. L. Ryan's store at Twenty-second and Grant. Mr. Ryan was not registered, and at one time had trouble with the board for this reason.

THE SOUTHWEST.

H. Moulton has given chattel mortgage for \$1,000 on his store at Kirwin, Ks.

A new drug store has been opened at Amazonia, Mo., by Beaver & Horton.

E. M. Ovren has purchased William Baer's stock of paints and oils at Aspen, Col.

D. A. Stebbins has bought out the interest of his partner, Mr. Van Corben, in the drug store at Council Grove, Ks.

J. T. White's drug store, at Millersburg, Mo., was destroyed by fire a few nights ago. The loss is estimated at \$1,500 with no insurance.

W. M. Casson's drug store at Montgomery, Mo., was burned in a disastrous fire in that town a few days ago. The stock was partially insured.

The Laclde Medicine Company, of St. Louis, has been incorporated with a capital stock of \$5,000, all paid. A. M. Link holds 250 shares, H. A. Dawkins 249, and W. Muswick 1 share.

Maud Matheson has opened a drug and grocery store at Fort Gibson, Indian Territory, and R. M. Walker has bought the drug and grocery store of R. L. Fuller in the same town.

Mrs. Margaret Wright is seeking in the courts at St. Joseph, Mo., to get a judgment of \$5,000 against Druggist Eugene Soper. She alleges that he made an error in filling a prescription for her and that she suffered in consequence.

The Ute Pass Paint Works in Colorado City, Col., were burned to the ground a few days ago. The loss, including building, machinery and stock on hand is estimated at \$75,000; the insurance, \$17,750. The fire started in the shipping room.

The drug stores of Slack & Day at Godsden and Selma, Ala., have been closed on attachment in favor of the Bank of Godsden. The claim is less than \$2,000, and was contracted by the Godsden house. The stores will probably be reopened.

The Frantz Drug Company, of Galena, Ks., was granted a charter and certificate of incorporation by the Secretary of State a few days ago. Its capital stock is \$4,000. The directors are J. E. Enterklim, J. W. Hutchins and W. E. Still, all residents of Galena.

Fire broke out in Barrett's drug store at Solomon City, Ks., not long ago. It destroyed the building, spread to Carter's drug store and to several buildings, all of which were burned to the ground. The loss on the drug stores was partially covered by insurance.

The City Council of El Dorado, Ks., has passed an ordinance forbidding the sale of cigarettes to minors under 16 years of age, affixing a license of \$300 for dealers who handle them, and it has become a law, having been signed by the Mayor and published in the official paper. A fine of not less than \$25 or more than \$100 was fixed for violators of this ordinance.

Two women giving the names of Mrs. M. D. Townsend and Miss Jane Townsend were arrested in St. Louis a few days ago. They are accused of having swindled W. A. Dell, a druggist at Jacksonville, Fla., out of a large amount of money. The women, it is said, opened a fashionable boarding house in the Florida city and by false pretences succeeded in securing large credit. They fled overnight to St. Louis, and when arrested had \$500 in money and a small fortune in diamonds secreted in their room.

PACIFIC COAST.

The City of Oakland is negotiating the location of a residential hospital.

During a fire at Sanger, near Fresno, Cal., on the 5th, Elmson's drug store was destroyed. The amount of loss is not known.

William M. Merkel, brother of H. M. Merkel, of Seattle, died at the Jefferson Hospital in Philadelphia a few days ago. Mr. Merkel was a druggist by profession.

Stockton, Cal., is having somewhat of a scare over the prospect of epidemical small-pox. Just why they should look for it this year more than any other time is not known.

The late Gustave Leplutz, of San Francisco, left an estate valued at \$60,000. He owned a half interest in a drug store at 25 Sutter street. His will divided his property among several charities and friends.

The firm of Dubbs & Goodwin has been organized at Seattle for the purpose of transacting a general drug and mercantile business. Capital stock, \$6,000. Incorporators are Henry Dubbs, John W. Goodwin and W. S. Dubbs.

The society for the prevention of vice is making it lively just now for a number of druggists in San Francisco. The secretary of the society is arresting a number of them on the charge of selling morphine without the necessary physician's certificate.

The Legislature of Utah has been acting, and the courts suggest what is known as the medical practice class law, by which it is the purpose to reduce somewhat the number of men practicing medicine in that territory who have not taken the trouble to obtain the diploma.

Dr. Oscar J. Macer, a practicing physician of San Francisco, who had two drug stores, has transferred them to Leon Guckenblum, of the wholesale drug firm of Mack & Co., for the benefit of his creditors. Liabilities of both stores are placed at \$45,000, with assets something less than one-half that amount.

The S. P. C. A. has been making a raid on dealers in live lizard jewelry, and as several of our local druggists had added the novelty to their line, they are having trouble with the society referred to. A determined effort will be made to put a stop to the habit of chaining up lizards to be worn as ladies' ornaments.

The following firms submitted bids to the hospital committee of San Francisco for supplying drugs and medicines for the coming year: Mack & Co., \$31,822; Langley & Michaels, \$38,010; and Clinton O. Worden & Co., \$48,888. The bid to Langley & Michaels for surgical supplies was accepted; and for drug supplies the contract went to Mack & Co.

C. W. Fisher owns a drug store at San Jose in which his night clerk, Ed T. Off, has his quarters. A few nights ago the clerk admitted a man in response to a knock at the front door, and while the clerk reached for the medicine which had been asked for the man turned off the gas, leaving the store in darkness. The customer then demanded the money, when the clerk resisted his demands, and a fight ensued. The plucky druggist was knocked down, but managed to fire two shots at the robber, which resulted in frightening him away before he obtained any booty.

ATLANTA, GA.

Powers & Heynolds, Maysville, Ky., are succeeded by Mr. Powers.

Snyder & Bingham, Decatur street, are succeeded by Mr. Bingham.

R. F. Watson will move into a new store corner Jackson and Houston streets. Bradham & Brock, New Bern, N. C., are successors to Dr. C. C. Greene, deceased.

S. E. Cox, corner Line and Hudson streets, Nashville, Tenn., is succeeded by H. Handle.

C. E. McKee, Greensboro, N. C., has purchased the business of J. Taylor, Washington, N. C.

William Strassy, deceased, corner of Preston and Ormsby streets, is succeeded by Joseph Millhiser.

Thompson & Hearne, Georgetown, Ky., have dissolved partnership, and are succeeded by Mr. Hearne.

The Winchester Drug Co. is the name of a new firm at Winchester, Ky., composed of Messrs. Imby and Ken.

Smith & Dozier will shortly open a branch store at R. F. Watson's old stand, corner Jackson street and Auburn avenue.

F. D. West, lately with the Lamar-Rankin Drug Co., is now traveling salesman for Wm. S. Merrell Chemical Co., of Cincinnati.

E. P. Price, of Greenville, Miss., will shortly open the Price Drug and Elder Manufacturing Co. in his city at 43 West Mitchell street.

The Spring City Elder and Vinegar Co., Huntsville, Ala., has commenced to rebuild its plant, which was destroyed by fire a few months ago.

Jacobs' Pharmacy has bought the business of Eugene Jacobs, 52 Marlette street, where the business of Jacobs' Pharmacy will temporarily be carried on.

In South Carolina "Hofen Weiss," or white hops, is under the dispensary ban, as the state chemist has reported that it contains 3.06 per cent alcohol.

W. A. Mathews has filed a petition for a receiver against the Haltiwanger-Taylor Drug Co. He alleges that the profits on the statements were not paid, but that a \$42,762 deficit exists.

Sol Cronheim, corner Whitehall and Hunter streets, has purchased the soda fountain of John Venable in the same store at sheriff's sale, and will continue the business as heretofore.

Lavonia, Ga., has one of the most enterprising men in the county. He is a practicing physician and druggist, proprietor of a canning factory, confectioner, farmer, and is now building a hotel.

V. S. Wolf, traveling salesman for the Columbia Chemical Co., Washington, D. C., was arrested in this city on a telegram from Lynchburg, Va., being wanted in that city for cheating and swindling.

At the commencement exercises of Meharry County Medical College, Nashville, Tenn., fifty-six negroes graduated. Forty-one in medicine, three in dentistry and twelve in pharmacy; of these twelve three were women, the first in the south to graduate in this profession.

The Southern Interstate Immigration Bureau has made arrangements whereby a party of medical and sanitary experts will make a tour of inspection through the south, the object being to correct the erroneous belief that the southern section is a territory of swamps and a hot-bed for the propagation of contagious malarial diseases.

BOARDS OF PHARMACY.

Maine Board of Pharmacy examined ten candidates at its Portland session February 15.

The North Carolina Board of Pharmacy meets in Raleigh, April 11 and 12, for the purpose of examining candidates for license to practice pharmacy.

Nebraska Board of Pharmacy at its session held in Lincoln, February 15th, examined twenty-five applicants, nineteen of whom passed successfully as registered pharmacists. They were Chas. E. Allen, Lincoln; Charles W. Anibal, Edgar; Frank Dufoe, Tecumseh; D. C. Mannagan, Craig; George S. Flory, Pawnee City; James J. Green, Curtis; L. Jordan, Elm Creek; P. S. Holtzinger, Nebraska City; G. S. Richmond, Jr., Alinsworth, W. D. Simmons, Beatrice; H. M. Wills, Omaha; O. S. Ward, Lincoln; W. F. Waggoner, Beatrice; C. A. Kaufman, Avoca; W. E. Paxton, Curtis; Rudolph Gabler, Columbus; L. A. Tyson, Elmwood; W. F. Dinsley, Lincoln. The next meeting will be held in Norfolk, May 9. The board will meet again in adjourned session in Hastings on June 5, when the State Pharmaceutical Association meets.

PHARMACEUTICAL ASSOCIATIONS.

Kansas Pharmaceutical Association will meet in Salina, May 29, 30 and 31. The Salina druggists have formed a local organization and an enthusiastic meeting will be the result of their united efforts. Emil Arner is the local secretary.
